THE LANCET.

OL. I.] LONDON, SATURDAY, SEPTEMBER 26, 1835.

T1835-36.

PREFACE

TO THE VOLUMES OF THE LANCET FOR 1835-36.

THE act of writing a PREFACE to a book, so often resembles the ceremonial of a first introduction to a new company, that it is generally executed with some degree of awkwardness, and, very frequently, under the pressure of embarrassed feelings. In our own case the plea of novelty, or of a first appearance, cannot be urged in extenuation of an imperfect discharge of our duty. But prefatory introductions to new works are generally compounded of the reasons which have induced the author to publish. and of promises relative to the materials which he will furnish for the amusement or the gratification of his readers. After twelve years of anxious and successful labour in the field of medical reform, it is unnecessary to reintroduce the reasons which first prompted the writer to publish THE LANCET; and, from circumstances and motives equally obvious and conclusive, we will not derogate from the character and influence of this journal, by inviting, through the instrumentality of pledges and promises, a more general attention to the subjects which are usually introduced into its columns. The occurrences of by-gone years must be taken, in both instances, as the best and surest guarantees of what the events of future years will produce. If, after the obstacles which we have successfully encountered and overcome; if, after the monopolies which we have demolished, and the monopolists whom we have made quail; it could be necessary to offer one word in proof of our sincerity and devotedness to the cause which we have so long advocated, why then, indeed, the prospect before us would exhibit a dreary void, unenlivened, unchecred, by a single feeling of inspiring hope. The pioneer in works of reform, labours but with a sorrowing mind when he is not urged onwards by the stimulating confidence of those persons who observe, and who are capable of understanding, the tendency of his actions. When, therefore, the success of THE LANCET, and the wide diffusion of the principles which that journal has advocated in promoting the cause of medical reform, are taken into consideration, it must be recollected that aeither of those results would be observable at the present period, had not the great members of the medical profession contributed, by their powerful supwirds making that journal the great instrument of their liberation aldom of the universities, hospitals, and other chartered medical then, all medical reformers stand on an inviting, an enviable, a position. Although they were perplexed, transmelled, and obstructed

at every step in the permanenement of their career, the onward interested of events in twelve brief years has terrified the conceited and titled drones attached to our colleges and hospitals into an acknowledgment of their guits and impotence, and has converted many of them from being the most instent of tyrants into the most submissive of hypocrites. It is not in one or two medical establishments only that the changes which have been effected are perceptible. The entire body is convulsed, and in several of the extremities of the hideous monster, monorour, the agonizing throes which precede dissilution, are at once both seen and felt. We are not advancing towards the goal of improvement by tardy lingering steps, but by a salient movement; and the strength which is daily acquired as the labour advances, gives an assurance, which cannot be shaken by any temporary disaster or check, of an unqualified and permanent success.

What, then, is the ultimate object of the national work in which medical reformers are engaged? Nothing less than the conservation of the public health. To this great end it is sought to bring the whole power and force of the principles of the science of medicine into active operation. Hence it is in the contemplation of what medicine might achieve, that we witness, at every step, in our charitable and public institutions, the barriers and drawbacks which have hitherto defrauded the public out of those manifold advantages which it is in the power of the learned and experienced members of the profession to confer. At present the whole system of medical government is sustained on the odious principles of self-election and monopoly. It is a compound of nepotism, knavery, and extortion. The highest posts of honour are occupied for the most part by imbeciles; and men endowed with the highest attainments which can ornament the human mind,—who may have endeavoured to obtain rank in our public institutions, through the instrumentality of merit,—unaided by the influence of wealth and family commexions, would engage in a toil which could have no other result than that of bitter disappointment.

As illustrative of the exclusive character of the proceedings in our hospital and other public medical institutions, we cannot call to mind, at this moment, a single instance in which a medical student in this metropolis,—out of all the hundreds and thousands who have attended our schools since this journal was first published,—on whom has been conferred a post of honour and emolument as a just reward for his industry and attainments. This is a frightful fact. It is puerility itself to employ argument in denouncing auch a system. In what other quarter do we find its parallel? In what other profession? Certainly not in the Church. Obviously not in the Law, for, in both, men of industry and great mental powers are sure of obtaining preferment. In medicine the highest collegiate title is that of the doctorate; yet it has been, and is now, obtainable by a display of telent—it is almost a profanation to use the term in this place—which would excite even the derision of the drag-dealers in Rhubarb Hall. Still this distinction may be obtained by residence, by lounging, and by money. The M.D. is then turned adrift upon society—let loose like a newly-weaned, wild, and cast-off monster, to feed and fatten on the vitals of the community.

Why, in every county town with its four and five thousand inhabitants throughout the kingdom, there lived, not ten years back, your puny boy-doctor, a "graduate," an "university man," it is true, but who, of hospitals knew only that they the peculiarities of disease knew nothing. Henceforth those ambition at Jericho till their beards be grown." The surgeon in general practical and twenty years experience, is not to be thrust aside by each aspirants for fame. Our medical colleges have been so many medical numerous, and have tended

avery penalties way, the advancement of that science which they were instituted to promote and protect. Arouse your energies, then, English sargeons. Continue your exertions in the cause of medical reform, and suffer them that for one instant to relax or abate. It is in consequence of your advocacy and sustemance of the principles which have from time to time been promulgated in the pages of this journal, that so much has been achieved. We can feel to reluctance in taking to currelyes that portion of reward and praise which is our due, for having projected and instituted a free medical press,for having insisted on and obtained the right to publish lectures which are delivered on public medical foundations,—for having proclaimed and enforced the right to publish the cases which are presented to the view in the wards of our hospitals; but had we not found a spirit of sympathy among the mass of our professional brethren, all our exerions would have proved fruitless, all our anxieties and labours must have been utterly and wholly unproductive. Diffused as are the members of our profession over the entire surface of the country; moving as they are in the first circles of society, what egitimate object is there connected with the science of medicine, which it is not in their power to accomplish? Left free and unshackled by the odious trammels of pariamentary statutes, the science of medicine would have flourished, would have asserted and established its supremacy, amongst a people so thoughtful and reflective as the English. But it is only now fettered by chains which have been rusting and decaying . or upwards of three hundred years. The operations of time, however, have at length so weakened these galling and perplexing restraints, that a few more efforts on the part of the oppressed will break them into atoms and cast them aside for ever.

What, then, is wanting in medicine in order to give the best security to the public realth, and to clear away all the rubbish, toll bars, and checks, which are still to be ound on the road of medical preferment? Of no consequence is it under what names hey exist, whether under those of universities, colleges, hospitals, or schools. They must not be allowed to obstruct genius in the pursuit of knowledge and of ame. If these institutions cannot, by a wise and prudent system of legislation be rendered subservient to the exalted objects of medical science, the interests of society demand that they should be diverted to some other purposes, or that they should ease to exist. No point now remains to be elucidated on this subject; it is adequately understood by every tyro in the profession. In the evidence which was taken before the Parliamentary Medical Committee, and a considerable portion of which has lately been published in this journal, it has been shown that the surgeons of England who are engaged in the duties of a general medical practice, were spoken of by some of the self elected heads of their own College, as a subordinate class of medical society-nay, as nen who were aliens to the medical profession. The very by-laws of the College sink them into an inferior position, and attainments superior to those of mere handicraft degrade them beyond the pale of medical advancement. Manual dexterity is placed in the ascendant, while a knowledge of the principles of medical science brings upon its possessor an infliction which approaches in character to the severity of a penal punish ... ment. If the members of the British Colleges of Surgeons could submit tamely and silently to injustice and insult of such a nature as this, they would deserve only the source . of every enlightened member of the community, instead of that sympathy which is now the the sections which they have progressively and successfully made

Never was there a time more favourable than the second or the second or

Benefit. Those surgions, therefore, of the United Stapping who are solicitous that gapin should have a clear field for exertion, - that merit should receive its due reward, - tha monopolies in medical practice should be destroyed—that the system of teaching in our medical schools should be placed on a new footing, that the offices in our hospitals should no longer be obtained by family interest or intrigue, -that secret remedies should ne longer be tolerated under the sanction of a government stamp,—that uniformity o title in the ranks of the profession should be made to depend on uniformity of attainmen in medicine,-such advocates of reform will continue to bestir themselves, and de vote their faculties to promote the success of the cause which they have so long sup ported. The application of excited energies, however, can be of little avail, if the power so exercised be not properly directed. Hitherto there certainly has been no misapplica tion of that moral and intellectual influence which the members of the medical profes sion are able to direct against their enemies and persecutors. All our grievances are traceable to the defective state of the law. Towards the Legislature, therefore, every movement tending to promote an improvement of that law should be employed; and, a: there is a perfect concordance of opinion amongst British medical practitioners relative to the extent and character of the abuses which are connected with the science are practice of medicine, there will be little difficulty in establishing a complete unity of action towards effecting their removal. If it were not for the obstacles which exist in the form of Charters and Acts of Parliament, medical practitioners might, by a judi cious combination of their abilities and numbers, carry out their views into a well organized system of government. But the strong arm of the law now interposes it power, and forbids any final adjustment of the question, without the intervention of the Legislature. As this is a fact which remains undisputed and is indisputable, there is no surgeon in the empire who has devoted the smallest portion of his time to a considera tion of the subject of medical grievances, who will not freely and candidly admit that i is to the Legislature, and to the Legislature alone, that application must be made for an instrument which will be adequate to the demolition of our incorporated monopolies.

In acknowledging, also, the supremacy of the Parliament in this respect, it is exhibitate ing to observe the kindly sympathy which the complaints of the profession have alread: excited in both Houses of the Legislature. If a reference be made to the debates in the Houses of Commons and Lords on the passing of the Apothecaries Act in 1815, and to the discussion in the House of Commons on the introduction and rejection of the Surgeons Bill in 1816, it will be perceived that a most extraordinary revolution has occurred amongst our senators, regarding the claims which medical practitioners have see forth for the purpose of showing that they are entitled to protection from Parliament But in 1815 the question of MEDICAL REFORM was not understood either in or out or Parliament. It had been, then, only partially discussed. A few petty grievances had been considered, and some imperfect remedies had been suggested, but no comprehensive evetem of medical government had-so far as we have been enabled to ascertain, from a careful examination of the writings of that period-engaged the attention, or eccupied the minds, of our medical regenerators. During the last twelve years, however, the subject has been unceasingly discussed in all its elementary branches; and we verily believe that the surgeon's apprentice of two years' standing, in 1835, understands more of the question, and could argue it more effectually in writing and in converge could any six members who belonged to the House of Commons in M ible is the feeling of encouragement which this rapid advag energy and exertion!

In admitting, therefore, the supremacy of the Landinture, let us mot

of what is our duty towards that depository of the will of the nation. If any ladiridual feel disposed to condense the Pavliament for its conduct in 1315, he is bound, on every principle of justice and sound policy, to use his own individual afforts towards rendering the members of the present Legislature amenable to public orining for any missonduct in framing and passing crude and incompetent laws for medical government. It is our duty, as well as our interest, to afford to them full and adequate instruction relative to the extent and enormity of medical abuses.

But it may be said that a Committee of the House of Commons, headed by an able and indefatigable chairman, has been appointed to inquire into the state of medical law and practice, that witnesses have been examined, and that evidence has been taken. and much of it printed. Hence it may be inferred, that with such materials at their command, the whole subject of medical government must be well understood by the members of the House of Commons; whereas it is very probable that not more than six members of the medical Committee understand any one portion of the question thoroughly; and that the Chairman is the only member of that Committee whose judgment on the subject of medical policy has been matured and confirmed by a patient, unprejudiced, and philosophic investigation of the abuses connected with the existing system, and who is fully sensible of the principles on which a strictly new system should be established. If the members of the House of Commons could find time to peruse, with the requisite attention, evidence taken before Committees, nothing more would be required to enable them to understand the various questions brought before them. But the reports of the House are so numerous and voluminous, and embrace such a multiplicity of national affairs, that it is not possible for any man, whatever may be his industry, the strength and accuracy of his memory, or the vigour and capacity of his mind. to analyse a twentieth part of the sessional reports which are placed on the table of his study. This deficiency extends, in some measure, to documents connected with every department of the state. There are, possibly, a few men in each House of Parliament who are capable of discussing with accuracy several prominent important features of every great question; but it seldom happens that more than two or three members, especially if the subject be new to the House, who take a view of the whole question. and understand it thoroughly. In law reforms, in church reforms, in municipal reforms, in matters of international commerce, the accuracy of this statement is sustained by a vast mass of facts. Whenever, therefore, it is sought, in either House of Parliament, to institute a new law, the parties interested in the success of the measure invariably furnish the members of the senate with a "digest" of their " reasons" for urging institution, and an abstract of the principles on which the new enactment is to be founded. Various means are adopted for this purpose. Petitions are placed in the hands of the members. Printed explanations of the arguments which can be adduced in favour of a particular bill are industriously insinuated into the hands of the members in the lobby and passages of both Houses. The agents for new bills, and the friends and supporters of those measures, visit many of the members personally, and explain prally the objects which they have in view; and, when the claims of the parties are well cunded,—are sustained by the principles of justice and of reason, their efforts, in nineon cases out of twenty, are ultimately rewarded with success.

they have already employed so energetically, and with such infect, available of further acc of the cause of medical reform. Of all the modes of medical reform.

PREPACE.-MEDICAL REPORM.

٩i

judice, there is some equal to the enforcement of truth in personal conveniation. Sould are dissipated as they arise; questions are instantly unawered; objections are suddenly rémoved. The organs of meech are instruments of infinite power when their movements are directed by a jufficious and well-fortified mind. Already have the members of the profession proceeded in the work of senstorial instruction most industriously and impressively. We implore of them not to relax in their exertions. The fruit of their labours is already apparent in the desire which the House of Commons has recently manifested to render justice to the members of the medical profession. The science of medicine itself is spoken of with admiration in that assembly, and the claims of medica practitioners are treated with marked attention. The tone of the Commons in this instance is not more striking than it is extraordinary, considering the temper and ignorance of that body on medical subjects, so lately as in 1815. The alteration car neither be explained nor understood, except by making an unqualified acknowledgement of the value of the individual exertions of the members of the profession amongst members of the Legislature residing in their respective localities. In earnestly entreating that those exertions may be unremittingly continued until the next session of Parliament,-in imploring our professional brethren to embrace every opportunity which may be made instrumental in acquainting members of both Houses of the Legislature not only with the extent and character of medical abuses, but also with the principles on which a new law should be instituted for establishing ONE UNIFORM SYSTEM OF MEDICAL GOVERNMENT, executed TRIPARTITELY, in the three great divisions of the empire, we are, in reality (and we write under a conviction which is founded on personal observation), beseeching them to take that course which will lead to the speediest and happiest termination of their labours; and while the value of the disinterested and patriotic efforts made by British surgeons in the cause of humanity and justice, will be gratefully acknowledged by an intelligent community, the splendid results of those efforts will be solemnly proclaimed to the world, in an ACT of the Imperial Parliament.

LIST OF THE SCHOOLS OF MEDICINE

IN LONDON.

OPEN TO STUDENTS IN THE SESSION 1835-36.

E districts of the metropolis in which (institute any comparison between these medical schools are situated, may be ated, according to the situation of the tals, into the following divisions :e containing the London Hospital, situ-

t the eastern extremity of London, in hitechapel-road.

vitals, situated in Southwark, near the of London Pridge.

ne containing St. Bartholomew's Hospintuated in Smithfield.

ne containing the North London Hospiand the Middlesex Hospital, near Totam Court Road.

ne containing the Westminster Hospital. ited at the back of Westminster Abbey which division, if not in the previous ict, the Charing-Cross Hospital may be ed, when it is "recognised" by the ical boards; an event which circumes will, most probably before the expin of another year, render unessential to stablishment as an office for the sale of ficates to students; and, finally,

ie containing St. George's Hospital, ted at Hyde Park Corner.

each of these institutions there is now hed an association of gentlemen who er courses of lectures on those subjects are named in the "Regulations" of Company and the College ir neighbourhood

various establishments, for the difficulty of selection amongst them, on the score of superiority of advantages and instruction, becomes every year more difficult, (with one or two exceptions, which have already been indicated in the pages of this ne containing Guy's and St. Thomas's journal,) we proceed at once to lay before our readers a digest of the advertisements issued from them, in the order enumerated in the preceding list of the hospitals. We may first premise, however, that on comparing the present arrangements of the schools with those of last year, the change of lecturers, and the rising and sinking of schools, are not less numerous than they were observed to be at the commencement of the last session, as compared with the arrangements of the session before that. How, in fact, the lecturers can, with any approach to gravity of countenance, in the face of these incessant variations, allow themselves to offer to students the optionof "perpetual" attendance to their courses of lectures, we know not. The word "pernetual," however, is to be found in almost every prospectus, and we may here observe that in the lists of fees in the subjoined tables, the accord sum is the fee required for entrance under that head. The first sum is the fee named for single courses, either of three or six months duration. Reserving, then, such observations as we may be dispilar courses posed to offer to students on this occasion antil the list of schools is concluded, we the latter materal begin at the east end of the metropolis, and mt. attempting Talinsert first an account of the

 First Winter Session. — Chemistry; Anaions, of which distinct Certificates are re- strations; Materia Medica and Therapeutics. mired.
- 4. Of having attended at least two courses of Lectures on Surgery, delivered in two listinct periods or seasons, each course to comprise not less than sixty Lectures.
- 5. Of having attended Lectures on the practice of Physic, on Chemistry, and on Midwifery, during six months; and on sotany and Materia Medica during three
- 6. Of having attended during twelve months the surgical practice of a recogsized hospital in London Dublin, Edinburgh, Hasgow, or Aberdeen; or for six months es of such hospitals, and twelve ny necesnised provincial Hos-

APOTHECARIES' HALL.

The Board of Examiners at Apothecaries' The Council of the College of Surgeons | Hall require candidates to attend the following Courses of Lectures:

Students whose attendance on Lectures 2. Of having been engaged five years in tober, 1835, will be required to produce he acquirement of professional knowlege. proof of having attended Lectures during 3. Of having studied Anatomy and Physithree Winter and two Summer Sessions, in

The Winter Medical Session is to be unwo anatomical seasons. An anatomical derstood as commencing on the first of cason is understood to extend from Octo- October, and terminating in the middle of ser to April inclusive, and to comprise at April, with a recess of fourteen days at cast 140 Lectures on Anatomy and Physio- Christmas; the Summer Session as com-

n a similar manner; exclusive of Dissectiony and Physiology; Anatomical Demon-

Second Winter Session. - Anatomy and Physiology; Anatomical Demonstrations; Dissections; Principles and Practice of Medicine; Medical Practice of an hospital.

First Summer Session .- Botany, and such other branches of study as may improve the student's general education.

Second Summer Session .- Botany, if not attended during the first summer session; Midwifery and Diseases of Women and Children; Forensic Medicine; Medical Practice of an hospital.

Third Winter Session .- Dissections : Principles and Practice of Medicine ; Midwifery, with attendance on cases: Medical Practice of an hospital or disugnsary.

The Student is also required to attend the Medical Practice of a recognised hospital, from the commencement of the Second Winter to the termination of the Third

The following are the PERPLEXATIONS, or "Regulations," which have been ordained at Rhubarh-Hall to bewilder those candidates for the license of the Company, who are severally circumstanced as below stated, and not now commencing their payments under the ticket-system for the first time: -

Students whose attendance on Lectures commenced prior to the 1st of February, 1828, will be admitted to examination in conformity with the Regulations published in September 1826, viz., after an attendance

One Course of Lectures on Chemistry One Course of Lectures on Materia Me-

dica. Two Courses of Lectures on Anatomy and

Physiology. Two Courses of Lectures on the Theory

and Practice of Medicine.

And six Months' Physician's Practice at an Hospital, or nine Months at a Dispensary.

Students who beyon to attend Lectures subsequently to the 1st of February, 1828, and previously to the 1st of October, 1828 in conformity with the Regulations of September, 1827), will be admitted to an examination after an attendance on

One Course of Lectures on Chemistry

One Course of Lectures on Materia Medica and Botany.

Two Courses of Lectures on Anatomy and

Physiology.

Two Courses of Lectures on the Theory and Practice of Medicine: these last having been attended subsequently to the Lectures on Chemistry and Materia Medica, and to and Children .- Two Courses. one Course at least of Auatomy.

And six Months, at least, Physician's Practice at an Hospital, or nine Months at a Dispensary; such attendance having commenced subsequently to the termination of in Morbid Anatomy. the first Course of Lectures on the Principles and Practice of Medicine.

Students whose attendance on Lectures commenced in October, 1828, must have complied with the Regulations of September, 1828, viz., by having attended

Two Courses of Lectures on Chemistry. Two Courses of Lectures on Materia Me-

dica and Botany.

Two Courses of Lectures on Anatomy and Physiology.

Two Courses of Anatomical Demonstraions.

Two Courses of Lectures on the Theory and Practice of Medicine : these last having been attended subsequently to one Course of Lectures on Chemistry, Materia Medica, scribed by the Regulations. and Anatomy.

And Six Months, at least, the Physician's Practice at an Hospital (containing not less than sixty beds), or nine Months at a Dispensary: such attendance to have commenced subsequently to the termination of the first Course of Lectures on the Principles and Practice of Medicine.

Students who began to attend Le tures in January, 1829, are required to have attended the Physician's Practice at an Hospital for nine months, or at a Dispensary for twelve months, and also to have attended

Two Courses of Lectures on Midwifery, and the Diseases of Women and Children.

Students whose attendance on Lectures commenced on or after January, 1831, must addree proof of having devoted at least 'wo years to an attendance on Lectures and Hospital Practice; and of having attended the following Courses of Lectures:

Chemistry .- Two Courses-Each Course consisting of not less than Forty-five Lec-

tures.

Materia Medica and Therapeutics .- Two Courses - Each Course consisting of not less than Forty-five Lectures.

Anatomy and Physiology. - Two Courses-Of the same extent as required by the Royal College of Surgeons of London.

Anatomical Demonstrations. - Two Courses Of the same extent as required by the Royal College of Surgeons of London.

Principles and Practice of Medicine,-Two Courses - Each Course consisting of not less than Forty-five Lectures, - to be attended subsequently to the termination of the first Course of Lectures on Chemistry, Materia Medica, and Anatomy and Physiology.

Bolany .- One Course -- Consisting of not less than Thirty Lectures, - to be attended between the 1st of April and 31st of Oc-

Midwifery and the Diseases of Women

Forensic 'Medicine,-One Course-to be attended during the second year.

Students are likewise earnestly recommended to avail themselves of instruction

The Candidate must also have attended, for Twelve Months, at least, the Physician's Practice at an Hospital containing not less than sixty Beds, and where a Course of Clinical Lectures is given; or for Fifteen Months at an Hospital wherein Clinical Lectures are not given; or for Fifteen Months at a Dispensary connected with some Medical School recognised by the Court. No part of this attendance can be entered upon until the termination of one entire year from the commencement of attendance on Lectures, nor until one course of Lectures, at least, on Chemistry, Materia Medica, Anatomy, and the Practice of Medicine, has been attended in the order pre-

Registration.- A book is kept at Apothecaries' Hall for the registration, at stated times, of the names of students

lectures, hospitals, attend.
All students in the life in the condition of the condition in sonally, and to register the sever for which they have taken tickets; and those finly will be considered to have complied with the regulations of the Court, whose names and classes in the register correspond with the testimonials of the teachers.

The book will be open for the registration of tekets authorizing the attendance of students on lectures and medical practice during the first twenty-one days of October, and first fourteen days of May, from nine o'clock until two; and for the registration of certificates of having duly attended such lectures or medical practice, during the last fourteen days of April and the first fourteen days of August.

Examination.—Every person offering himsolf for examination must give notice in writing to the clerk of the Society, on or before the Monday previously to the day of examination, and must also at the same time deposit all the required testimonials at the office of the beadle, where attendance is given every day, except Sunday, from nine until two o'clock.

The examination of the candidate for a certificate of qualification to practise as an apothecary will be as follows:—

In translating parts of Celsus de Medicina, and Gregory's Conspectus Medicine Theoretice:*

In Physicians' Prescriptions, and the Pharmacopæia Londinensis:

In Chemistry:

In Materia Medica and Therapeutics:

In Botany:

In Anatomy and Physiology:

In the Principles and Practice of Medicine.

The examination of a candidate for a certificate of qualification to act as an assistant to an apothecary, in compounding and dispensing medicines, will be as follows:—

In translating Physicians' Prescriptions, and parts of the Pharmacopecia Londinensis:

In Pharmacy and Materia Medics.

By the 22nd section of the Act of Parliament, no rejected candidate for a certificate to practise as an apothecary, can be re-examined until the expiration of six months from his former examination, and no rejected candidate as an assistant until the expiration of three months.

ares of children.

The Court meet is the Hall every Thursday, where candidates are required to attend at a quarter before four o'clock.

For information relative to these regulations, students are referred to Mr. Watson, who may be seen at his residence, 43, Berners Street, between the hours of nine and ten o'clock every morning (Sunday excepted).

It is expressly ordered by the Court of Examiners, that no gratuity be received by

any officer of the Court.

THE LANCET.

London, Saturday, September 26, 1833.

In some of the preceding pages of the present Number of THE LANCET will be found the announcements of the Medical Schools for the Session 1835-36. The statements which we have printed are taken from the prospectuses which have been issued by the conductors of the various establishments. We are not answerable, therefore, for what we have inserted, further than concerns the accuracy of our extracts. Heaven forbid that we should be answerable for the promises and pretensions of the lecturers! The bills of fare for the present year are, for the most part, screwed up to the last turn of extortion, in perfect consonance and keeping with the regulations which have been recently issued by the Apothecaries' Company. Oh those drugdealers of Rhubarb Hall! They will receive a dose of physic soon from another establishment, the effects of which will be permaneut, both upon their constitutions and their coffers. Never was there endured, in a civilized country, a more abominable system than that which affects to lecture a student into a knowledge of the practice of medicine and surgery. In the absence of statutory enactments no such abomination could have existed even for five years. It would have been broken down under the pressure of its own guiltiness. It is made up of falsehood, fraud, and avarice. Still, the students must bend to the existing re-

Students may undergo their Latin examination in these works at the commencement of their studies is sendion, by giving notice to the headle, at their resistantion, of their wish to the so. And situated their section of the sending and application to the sending sending an application to the sending sending and application to the sending sending and purposes an in-

plundered, -or they cannot, according to the decisions of some of our judges, become legally-qualified practitioners of medicine in any part of England or Wales. The moment, however, that they obtain their qualifications, they have it in their power, by the positions which they are enabled to occupy to contribute towards the overthrow of the system which, for a time, they are compelled to support by their unwillingly-paid funds We call upon them, therefore, to conform strictly to the " regulations" of the Boards of Examiners. And this demand upon their patience and good-temper is made in the hope of seeing them turn, as hundreds of their predecessors have turned, with vigour and boldness, upon the monopolists and the extortioners, for the purpose of effectuating that general smashing of the medical lecturing concerns, which have not only sprung up in the metropolis, but are now springing up, like so many foul fungi, in every part of the British empire. Is it not the boast of all our writers on medicine and surgery, that, from the seventeenth to the eighteenth century, the science of medicine had advanced with the most rapid steps of improvement? And yet, -hear it, ye lecturers and pretenders!-there neither existed then, nor in 1314, any such peremptory system established by law as exists now. Let those surgeons who are engaged in the practice of their profession in our country towns, and who have faithfully discharged the obligations imposed on them by the indentures of their apprentices, - let those surgeons, we say, refer to the bills of fare exhibite I in the preceding pages,-to the charges for the stale and stolen hashes of words which the students are compelled to purchase in this metropolis, or be excluded from the pale of the prefession. Let them observe, also, that no distinction whatever is made by the colleges, hospitals, and schools, between the instructed and uninstructed applicant. The young man whose mind is well stored with a knowledge of the principles an I practice of his profession, is compelled to expend as same terms, that

gulations,-must submit to be duped and i much time and money in this metropolic upon lecturing and ward-walking, as the individual who has never devoted an hour of his life to the consideration of professional subjects.

> Why, rather than that such a system as this should continue to flourish, it would be preferable for our hospitals and schools to be swept from the face of the earth. Why is the knowledge which the country surgeon communicates to his pupil, treated as nought by the extortioners of our colleges and companies? It is one of the grossest insults that was ever offered to a body of educated men. By the existing regulations, all the medical students in the kingdom, unless they have paid certain sums of money to other schools where the system of folly and of falsehood is carried partially into operation,-all the students, without exception, we repeat, are treated as so many dunces, -as mere beginners in the rudiments of medical education. What doctrine does this inculcate to the community? Why, that those surgeons who take apprentices are incapable of instructing them even in the very elements of professional knowledge. Thus, in the course of years, they are deprived of those fees which they are entitled to receive from their apprentices, because parents and guardians, naturally enough, contend, that if the knowledge which the student derives during his apprenticeship does not lessen the expense of a medical education in London, the money paid for the papilage in the country is, virtually, thrown away. Thus a flagrant robbery is committed on the great body of surgeons and apothecaries who are engaged in private praccice, and a most shameful injustice is inflicted on the student, who, during his apprenticeship, and under the able and generous guidance and instruction of his master, has succeeded in obtaining a practical and scientific knowledge of his professi With what show of reserve tended that the prentice should be treet

imposed on the one,-that no privilege qualify his pupil for the practice of the proshould be awarded to the other?

" "Oh, but there are prizes given in the schools! Look," some blockhead may exclaim, "at the splendid announcement of prizes which has just been made in the prospectus of the St. Bartholomew's school!" Bah! It is all humbug and quackery, and our legal authorities. Hence it is that we the lecturers know it. When are the prizes would entreat the whole of our medical awarded? Certain enough, at the end of students to comply with the terms which every session, when the last shilling has are laid down in the "regulations" of the been extorted from the pockets of the stu- examining bodies. The triumph of principle dent! And of what do the prizes consist? is about to be acknowledged. This, there-Why of "Books," written, we suppose, by fore, is not the time for making stumblingthe STANLEYS, the EARLES, the VINCENTS, blocks out of collegiate forms, or for hesiand genuises of that class. If anything could tating relative to the payment of a sum of display effectually the monstrous character money which is unjustly demanded, when it of this PRIZE FARCE, which has just been is quite certain that a non-acquiescence got mi as the new catch-fee of the day, it with regard to that demand may be conmight be seen in this fact, -that out of the verted into an instrument for one's own class which attends St. Bartholomew's Hos. rnin. A judicious course of policy, therevital, not less than thirty-seven students,- fore, requires that the students should comthirty-seven !- obtained at one examination ply with the conditions of the bonds which "nizes" and "certificates of honour;" have been framed for their "benefit" by and, to complete the picture of absurdity, the heads of our Colleges and Schools. At the distinctions were distributed by that the same time they are bound to see that knowing man MATTHEW PRYME LUCAS, the other contracting powers do not escape Esquire, Alderman of the City of London, from the conditions which are obligatory on -a somewhat better judge, we take it, of them. Punctuality of attendance should in turtle, than of the quality of medical attainments. If the lecturers had introduced the which have been made in the prospectuses practice of awarding prizes on the ground of rewarding merit, alone, by instituting a free and open competition amongst all classes of medical students, they would have established fellowships, or scholarships, in their schools, and would render the successful competitors free to the hospital and classrooms during their sojourn in the metropolis. In a mental point of view, we admit, this may be no reward; but it might relieve. at any rate, some of the students from a payment of fifty or sixty pounds for tickets ich are of no other value than that of insrementation the procuration of so

fession, but to insist, at the expiration of the apprenticeship of the pupil, that he shall be admitted to an examination for the diploma of the College, or the license of the Hall. After what has occurred we know that the right would be disputed by many of all cases be enforced, and where promises are not redeemed in practice, the delinquents should be at once unhesitatingly exposed.

It should be observed, that we do not direct our strictures against individuals, but against the odious ticket-system generally. We complain not so much of the lecturers as a body, as of the incorporated monopolists who have originated and sustained the LEC-TURING ABOMINATION for their benefit. That some of the teachers, and several of the hospital surgeous, are men of capacity and skill, we freely and cheerfully admit; but they do not command our respect, because they resistlessly allow themselves to be that every surgeon in the dragged through the mire by authorities d right not only to which they have it in their power to control. We do contend, however, that the | an examination for a surgical diploma and principles and practice of medicine cannot be taught by means of oral addresses. We care not what may be the lecturer's capabilities of speech,-what may be the extent of his information and his experience. It is not possible to convey correct impressions of disease to the mind through the ear, which should be imparted through the medium of another sense. The eye must be The deviations from normal employed. structure and function must be seen, before they can be adequately understood. Until, therefore, the rights of all medical men are placed on an equal footing with respect to the privilege of educating youths for the practice of medicine, we shall continue to exercise, fearlessly and unremittingly, whatever influence we may possess, in the hope of demolishing the ticket and certificate system of our incorporated hospitals and recognised schools.

(From a Correspondent.) - On Wednesday last an apothecary was elected by ballot (not by concours) at Westminster Hospital.

The numbers were as follows :-Mr. Thurnam 102 Mr. Alfred Hall 68

Majority for Mr. Thurnam 34

Mr. Thurnam, a member of the society of Friends, was the protegé of the Artillery party, of whom Dr. Hallam is the great gon, and Dr. Wood the chief bombardier. As the mode of election had nothing to with the merit and competence of the party to fill the office, we have no one to congratulate on the result of the competition.

A GREAT meeting of the medical men residing in the Eastern part of England was appointed to be held at Bury St. Edmunds yesterday, Friday, the 25th just , for the purpose of forming an Eastern Provincial Medical Association. The names of 150 medical gentlemen were attached to the requisition by which the meeting was called. The system of Poor-law contracts has been the ori ginating cause of the requisition.

UNIVERSITY OF LONDON AND COLLEGE OF SURGEONS.

To the Editor of THE LANCET.

the admission to compete for a chair in a medical school were ever before compared." Things may be unlike, while the principles whence they result admit and require comparison. Your remarks necessarily lead me to inquire on what principles the London University, and on what principles the College of Surgeons, were founded, and ought therefore to have been conducted. It will then be seen in which of the two bodies the conductors have most deviated, and in what direction, from those principles. The London University was established, and the sum of 10,000l. was subscribed, for the advancement and promotion of literature and science, and for the purpose of affording opportunities of attaining such branches of knowledge as were not previously taught in London; and it was declared that candidates for professorships should be treated with such strict regard to justice, that a difference in competency, even so slender as the hair that turns the halance, should determine the choice. Have these principles really been acted upon? The facts will speak for themselves. A large portion of the funds was expended upon a building, of which the dome alone cost about 20,000%. That building has since been mortgaged partly to erect an hospital, the officers to which were appointed without even the form of an election. Those branches of science, such as moral philosophy and jurisprudence, which required endowment and support, and which it was one of the first objects of the proprietors to cause to be cultivated, have been left unprotected. The professors, who should have been elected with such nice regard to justice, were chosen in a manner the least conducive to justice and impartiality. If these things have resulted from the management of the London University, its conductors must have deviated from the principles on which it was founded, and surely the deviation has been in the wrong direction. After this turn to the College of Surgeons.

That corporation was embodied by charter, and if its conduct has been in accordance with the principles of the charter, the Council must stand acquitted of the serious charges of misgovernment which the directors of the London University have incurred. More than this: it cannot be denied that the changes made of late years by the College of Surgeons, have been marked by increasing justice and liberality; and, to revert to the case in question, the Council there acted upon principles to have charter itself seems to have while the Council of the Louis Taivers wanner distant of the Council of the Counci SIR,—Your comments on my letter of last week induce me again to address you. "You much doubt," you say, "if two former might not be least to the their might not be least to the comment of the last the same to the last the same to the last the same to the last the

TLINICAL LECTURE

ON CASES OF

NJURIES OF THE ABDOMINAL

AND

PELVIC VISCERA.

ANDREW ELLIS, Esq., M.R.C.S.I.,

Surgeon to the Jervis Street Hospital, and Lecturer on Surgery in the School of Auat., Med., and Surg., Peter Street, Dublin,

Gentlemen,-Ibeg your attention whilst I read an abstract report of a few cases which bear on the subject of the symptoms, pathology, and treatment, of injuries of the abdomen, and which have been selected from the case-book of the hospital for the purpose of illustrating those points.

CASE 1 .- Stabbing Wound of the Stomach. John Lawiess, aged 26 years, was admitted. into the hospital at nine o'clock p.m., on the 28th of December, in consequence of his having been stabbed with a knife by his brother, with whom he had been quarrelling. On admission he appeared to labour under the combined effects of the wound and drunkenness; he was weak, with pale sunken countenance, and quick pulse; he vemited repeatedly a considerable quantity of blood mixed with food. The wound was situated near the umbilions; it was about an inch and a half in length, and through it a piece of intestine of a pinkish colour protruded. The patient was now put to bed, and an attempt made to reduce the intestine, but this it was found impossible to accomplish in a perfect or satisfactory manner; it could be returned with moderate facility through the wound in the integnments, but instead of passing through the opening in the peritoneum and thence into the cavity of the abdomen, it went into a pouch or recess formed between the membrane and the abdominal muscles. During the efforts made ! to restore the intestine, he was very rest-less and unmanageable, bolding his breath, and otherwise resisting the efforts made to relieve him. It was now deemed advisable to have an enema administered, and a vein opened in the arm: when about twenty ounces of blood were drawn, the bowels were affected, and he became quite exhausted and pulseless, the skin being covered over with cold perspiration. Whilst in this state of synapse, the protruded intestine was returned into the state of the cold into th The fact of none of the contents maxing.

bandage, which was applied with a moderate degree of tightness. This being done, the patient was placed in a posture calculated to relax the abdominal muscles.

29. He has slept but little during the night, vomited three or four times, and complains of exquisite pain in the abdomen. which obliges him to scream whenever he makes a full inspiration : he cannot bear to be moved or touched in the slightest degree; the countenance is sharp and anxious, tongue brown; excessive thirst; pulse 140, and no secretion of urine. He was bled again to the amount of thirty ounces, and ordered three grains of calomel and half a grain of opium every hour.

2 o'clock p.m. The bleeding produced fainting; he has been exceedingly restless since the last visit, and suffered much from thirst and vomiting; the bowels have been moved, but no secretion of urine has taken place; at present he lies in rather a torpid state, with much heaving of the chest; the respirations are forty in a minute; the pulse is exceedingly quick and almost imperceptibly small.

30. He died at six o'clock yesterday even-

Autopsy.-On examining the body sixteen hours after death, it presented the following appearance. There was a small quantity of blood, but no food, effused into the cavity of the abdomen; and a wound about half an inch in length was found in the stomach, situated two inches from the pyloric orifice, and, consequently, much above the level of the external wound. There was no other viscus wounded, and the usual effects of peritoncal inflammation were but imperfectly marked.

Remarks .- There are a few points connected with this interesting case to which I beg to call attention. In the first place, it may appear to you somewhat strange, that the stomach should be the only organ wounded when the knife had entered the abdomen so low down as the umbilicus; however, when you call to mind that the situation occupied by the stomach must in a great measure be determined by the various degrees of plenitude or vacuity to which it is liable, that which, at first blush, appeared abstruse and unaccountable, becomes at once simple and intelligible. Now, be it remembered, that this unfortunate man had been drinking before the accident occurred, and that he subsequently vomited up food as well as blood. Under these circumstances, it is obvious that the stomach was distended, and conseonenty encroached on the umbilical region. at the moment the wound was inflicted, but when discharging its contents it contracted. and thereby withdrew itself from the ex-

is a strong proof of the accuracy of the explaintion. I gays the (FANCET, No. 629, page 753, when speaking on the subject of abdominal extravasations, and the steps taken by nature to prevent their occurrence were discovered in the cavity of the abdomin cases of wounds of the hollow viscera. She gradually became more and more exhausted, and expired in four hours after her admission into the hospital.

Autopsy .- On examination twelve bours after death, the peritoneum presented a healthy appearance, but a few cherry-stones. mixed with alimentary matter, were found in its cavity. When these substances were removed, a small rent was discovered in the mity of the spleen was likewise ruptured, there was however very little blood extravasated; all the other viscera were perfectly natural.

Remarks .-- You will observe that this was a case in which the injury was situated quite in the neighbourhood of the solar plexus, and that the patient never recovered from the first shock of the accident; the peritoneal inflammation.

those of ruptured bladder, but before we discuss them individually, I feel that a few observations on the subject of urmary extravasations in general would not be misplaced, and that they might be instructive titioner, when satisfied that extravasation to the junior part of my hearers.

ruptured; should blood pass from the ex- exit, and therefore will not become dif-ternal orifice soon after the accident, the fused through the neighbouring parts. re can't no doubt but extravasation has been as the control of the time enormously tume- reous incrustations which usually form on

survive, sloughs of the cellular membrane. saturated with a mixture of urine and illconditioned matter, will escape. Whilst these changes are taking place locally, the patient's constitution suffers severely; symptomatic fever becomes quickly established, limbs about in the bed; she drank with he feels hot and restless; complains of headache and thirst; the tongue is covered with a brownish tenacious matter; the secretions generally are diminished; and the pulse is very frequent. As the case advances, all these symptoms become worse; delirium and coma set in; the tongue is now dry, black, and contracted; the skin is often at this stage of the complaint covered over with a urinous sweat; the pulse becomes exceedingly small and intermittent; and, finally, death closes the scene.

If the description I have now given of descending portion of the duodenum, through the usual effects of urinary extravasations which they had escaped. The lower extre- caused by rupture of the urethra be correct, you must at once perceive the necessity of attention and decision on the part of the surgeon, and the fatal consequences which are likely to ensue, either from diffidence, hesitation, or ignorance, on his part. You should keep constantly in mind the pernicions effects produced by urine when brought in contact with any of the living animal textures, save the skin and mucous immediate cause of death cannot, therefore, membranes. In accordance with this view be fairly attributed either to loss of blood or of the subject, you should consider such a case as I have supposed to occur to be of The next cases for our consideration are local origin, but of a most dangerous tendency; you should, therefore, when called on, in the first instance, apply yourselves to the source of the evil.

Taking this view of the subject, the prachas actually taken place into the cellular Urinary extracasations may be suddenly membrane of the perineum and scrotum, produced either by blows or falls on the should introduce a silver catheter as far as perineum; or on the abdomen, if the bladheam, without using much force, into the der should happen to be distended at the mrethra; in all probability that will be down time of the accident. For example, let us to the laceration; he should now with a suppose a case in which a sportsman, whilst knife or scalpel make a free incision through in the act of riding his horse over a fence, the tumefied parts, until he has exposed the loses his stirrup, and is, accordingly, thrown catheter at the rupture in the urethra. By forward on his perincum with all his weight this means the urine already effused will be against the pommel of the saddle. Now, drained out of the cellular membrane, and in a case of this description, there is much in the event of any more escaping from the reason to suspect that the arethra has been aperture in the arethra, it will have a ready fused through the neighbouring parts. patient in attempting to pass water feels as This being done, the metallic instrument if he were emptying the bladder, yet none should be withdrawn, and a gum clastic escapes externally; and if the attempt were catheter should be introduced into the bladstended with a swelling of the scrotum, der, and retained there by a suitable appa-

its vesical extremity, until the breach in the quence of the great straining produced by urethra shall be considered up. The constitutional treatment of a case of this · description must vary in different instances, and be determined, in a great measure, by the sort of person affected, the character of the symptoms, and the stage of the complaint. For example; if the accident happened to a plethoric young man, and was succeeded by the ordinary symptoms of inflammatory fever, there can be no doubt as to the propriety of employing antiphlogistic remedies in the first instance; but let us now suppose the case to be far advanced, the scrotum in a decidedly sloughy state. The constitutional symptoms here change their character, and resemble those of a bad typhus fever. Here the constitutional plan of treatment should consist chiefly of stimulants and tonics: such as camphor, carbonate of ammonia, with small doses of opium. Mild nutritious wine, such as claret; or if the patient were in the habit of indulging largely in malt drink, porter or ale may be administered with advantage. I have never found bark in any form useful, nor do I believe that it does much good in any case where the tongue is covered with a dark dry crust, and the stomach disposed to nausee or irritability. The best local applications for this stage of the case, are warm dressings, and the fermenting poultice.

I have just now placed before you, in a familiar manner, the ordinary symptoms and treatment of a case of extravasation of urine, having supposed it to arise in a healthy young man, in consequence of a rupture of the urethra. Let us now take another view of the subject, and assume that the accident had happened to an old fox-hunter of dissipated habits and broken-down constitution, and inquire if the symptoms and treatment would, or ought to be, precisely the same in There certainly will be no reboth cases. markable difference in the local symptoms, and they should be treated by the catheter, incision, and poultice, as in the former case : but the antiphlogistic plan of trentment will not be applicable in this instance at all; on the contrary, the patient should be watched closely from the commencement, and as soon symptoms of debility shall appear, the treatment I have recommended for the second stage of the former case should be at once adopted in the latter.

You will occasionally meet in practice, cases of extravasation of urine in children, and inasmuch as they differ in some respects from those I have described as taking place both in young and old men, I feel it my duty to make a few observations on this subject.

The usual cause of extravasation in children, is the giving way of the nrethra, in consequence of a small calculus having become firmly impacted in it when on its way from the bladder. The breach in the canal sometimes effected by rupture, in conse- mentioned "that Corrections

the irritation of the foreign body, and the urgent desire to pass water, which is now mechanically resisted, and at other times it is, I believe, the result of alcerative absorp-tion, which has not been preceded by the adhesive inflammation. However, be that as it may, my present object is merely to apprise you of this fact, that the urine of children, being chiefly composed of water. does not, when extravasated so speedily, produce the same destructive consequences to the cellular membrane through which it may be diffused, as in the cases of adults, or old persons, which I have already described. When apprising you of this pathological fact, I do not wish to convey the idea that you should be less vigilant or attentive in your treatment on that account; on the contrary, the cause of extravasation (the calculus) should be removed as quickly as possible, and a free incision made into the distended parts, in order to allow the effused urine an opportunity to ooze out of the cellular tissue with which it has com-I pronounce the word " noze" emphatically; for you must not expect, that a rudden gush of nrine will take place when an incision is made into the affected part; this never happens unless the extravasated fluid is confined in a circumscribed cavity, which does not often occur. After the incision a poultice should be applied, but I never found it necessary to introduce a catheter in the case of a child; and, indeed, I think it a very fortunate circumstance that such a procedure can be dispensed with; for, if it were absolutely necessary, it would be extremely difficult, if not impossible, to retain it quietly in the bladder. The observations which I have now made refer merely to such urinary extravasations as occasionally take place external to the abdomen and pelvis. I trust I have said sufficient to prepare you for the fatal consequences which are to be expected when similar effusions occur within those important cavities. With a view to illustrate this part of our subject, I beg to call your attention to a few cases of ruptored bladder.

CASE 4 .- Rupture of the Bladder from a blow. - William Corry, aged 26 years, a currier by trade, was admitted into the hospital on the 19th of March, at 11 o'clock p.m., under the following circumstances. When brought to the hospital he was stupidly drunk; his friends stated, "that he had; been drinking all the day, and that towards evening he had suffered much from a desire and incompetency to pass water; that he subsequently got into a row, and that they believed he had been struck on the belly with a watchman's relative was quite in-possible to obtain any diagraction from himself; but Mr. Cullen, who doubted him.

tacks of retention of urine, from spasmodic stricture, when he was guilty of any debauch, a Full.—James Cod, aged 29 years, a sera heavy sleep.

thirst, heat of skin, quick pulse, and inability fore it. He was placed in hed, and a catheter to pass water. The catheter was introduced, was introduced, but nothing came away but and drew off about a pint of healthy urine; a small jet of blood. he was bled, purged, stuped, &c. &c., yet the retching, which had been moderate and lowed up by warm fomentations.

Twelve o'clock. The symptoms have induced constant; the abdomen was very creased in violence: the abdomen is very were met as the circumstances of the case seemed to indicate; blood-letting was frequently had recourse to, both by the lancet and leeches; blisters were applied, and the nouth was slightly affected with calomel; the atheter was introduced three or four times very day, but never brought away more han an ounce of urine at any one time, excepting on the second day after his aduission into the hospital. All the sympoms gradually grew worse; the countenance became exceedingly sharp, and exressive of internal distress; the pulse very small, and the abdomen enormously tumeied; there was much general emaciation und debility; and on the fifteenth day after he accident, death put a period to his proracted and exquisite sufferings.

Autopsy .- On opening the abdomen six mours after death, the following appearances vere discovered. The intestines were very nuch distended with flatus; the peritoneum was hut slightly vascular, with a few unall patches of lymph on its surface; lowever, the cavity contained between two and three gallons of pale urinous fluid. ()n

and that he had frequently relieved him by vant; whilst riding a spirited horse on the drawing off the urine." On examining the evening of the 31st of August, the aniabdomen, it did not appear to be particularly mal became restive, reared up, and fell full or tense; however, it was deemed ex- hackwards on the rider. He was much pedient to introduce a catheter, but no shocked at the time, felt weak, and sick, arine came away. The stomach pump was and was immediately conveyed home and next employed and brought up a large bled by an apothecary; in about two hours quantity of liquid, which appeared to be a after the accident he was brought to the compound of whiskey and porter. He was hospital, and on admission he looked pale now placed in bed, and immediately fell into and auxious, his skin was cold and his pulse slow and weak; he expressed a desire to 20. He slept soundly during the night, pass water, but was incapable of doing so. but is at present very feverish; complains It was ascertained that he was tipsey at the of pain in the lower part of the abdomen; time of the fall, and that he had not evacuis affected with headache, foul tongue, ated his bladder for a considerable time be-

Sept. 1, five o'clock a.m. He is very he was hied, purged, stuped, ac. ac., yet his sufferings were mitigated only in a restless, complains of intense pain all over milling degree. The fever continued for the abdomen, and is much tormented with wo or three days, without undergoing any hiceup. He was ordered twenty-four leeches important change; at the end of this time to the abdomen, their application to be fol-

unid, tympanitic, and tender to the touch; tense, and exquisitely painful; the pulse as breathing was harried and oppressed i 120 and hard; the bowels confined, and the was exceedingly restless, and occasionally dusing to pass water proper. The eatheter a was exceemingly restress, and occasionally desire to pass water urgent. The catheter uffered from hierup, and had a constant was again introduced, and brought away lesire to pass water. These symmtoms was again introduced, and brought away lesire to pass water. These symptoms nothing but a small quantity of blood. He was ordered to be bled from the arm to the amount of ten onness, and to have forty leeches applied to the abdomen, and an emollient injection.

> Five o'clock. The leech-bites bled profusely; the bowels have been freed, and he passed a small quantity of urine without the catheter; the pain in the abdomen is less severe.

Sept. 2, nine o'clock a.m. Bowels free; passed some urine; pain in the abdomen inconsiderable; however, the prostration of strength is very great.

Five o'clock. He seems to be quite exhausted, with sunken countenance; cold perspiration; pulse scarcely perceptible, about 180 in a minute; respiration 60, and laborious; he still complains of some pain in the abdomen.

3. He died at six o'clack vesterday morn-

Autopsy .- The abdomen was examined three hours afterwards. It contained about a quart of reddish fluid, which emitted a urinous smell: the peritoneal coat of the the country of the little-finger intertines was vascular, but there was no maining the bladder, a vent, capable of intestines was vascular, but there was no maining the extremity of the little-finger intertines found in its interest of patterior part, there is a country of the peritoreum; the margin of the peritoreum; the margin of the cavity of the peritoreum; the margin of the opening did its its interest anything re-tailed the parts of the bladder inmediately around it bladder itself was perfectly empty, and contracted into a firm ball.

Remarks .- I have thus read to you two very interesting cases of ruptured bladder, together with a description of the appearances exhibited at the nost-mortem examinations; and now, before we separate, I wish to make a few general observations regarding those cases. In the first place it must appear somewhat strange to you, that the bladder should have given way in both instances in that part which is covered by peritoneum. Now, this is not a mere accidental or coincidental circumstance, for, in every case that I am acquainted with in which the bladder gave way in consequence of falls or blows on the abdomen, the rupture took place in the peritoneal region of the organ. In support of this statement, I beg to refer you to two very important cases of this description, which have been published in the second volume of the "Dublin Hospital Reports," by Doctor Cusack. The only explanation I would venture to suggest, is the anatomical fact, that the superior and posterior regions are weaker than the other parts of the bladder; inasmuch as they do not receive any support from the reflections of the pelvic fascia; Whilst the peritoneal covering, which is comparatively thin and delicate, and being, in common with all serous membranes, devoid of clasticity, it is, therefore, incapable of accommodating itself to violence suddenly applied; consequently it yields only by the laceration of its proper structure.

The next point to which I am anxions to call your attention, is the difference which exists between the local consequences that result from urinary extravasation into the cellular and serous tissues. I have already mentioned to you that inflammation and mortification are the usual effects when it takes place in the cellular membrane; now I beg to state that in no one instance with which I am acquainted did mortification ensue from urinary extravasation into the cavity of the peritoneum. Judging from the usual effects of injury or irritation on that very delicate and sensitive membrane, it appears to me very extraordinary that in cases of ruptured bladder, in which the peritoneum is wounded and brought in contact with a very acrimonious fluid, it should be discuss, I trust yo rather slow in taking on inflammatory ac- placed. tion, and capable of effectually resisting its gangrenous consequences. In the case of

Cod, which ended fatally on the third day after the accident, the usual effects of peritoneal inflammation were but imperfectly marked; and in the case of Corry the patient lived to the fifteenth day, and the post-mortem appearances would scarcely warrant us in saying, that the distressing symptoms under which he laboured during his illness were solely the result of peritonitis. Dr. Creack's patients died on the eighth day after the accidents, and the appearances presented by dissection were, with the exception of the manatural vesical openings, and the consequent urinary cfusions, those usually resulting from peritoneal inflammation.

Gentlemen, here I wish to apprise you of what, in my judgment, is a very crroneous opinion, as regards the state of the peritoneum in fatal cases of inflammation of this membrane. It is generally stated by authors who treat of peritonitis, that the sudden cessation of pain, which usually precedes a fatal termination, is a sure sign that mortification has actually taken place. Now, I wish you to understand that my experience of this disease, and the dissections I have made of persons who have died of it, induce me to arrive at an opposite conclusion. With the exception of one or two instances, I have never been able to find gangrenous spots in the peritoneum, when examining the bodies of persons who have died of inflammation of that membrane; I am, therefore, disposed to think that it would be more in accordance with the principles of correct pathology, to consider this absence of pain as indicative of a fatal loss of sensibility, rather than a positive assurance of structural disorganization, and chemical decomposition. For my own part, although it may, perhaps, appear too figurative to say so, I look on the sudden subsidence of pain in those cases, as the incipient ebb of vitality; or, if you will, the first stage of death.

The reason why scrous membrane is more capable of resisting the gangrenous effects of inflammation than cellular membrane, in cases of urinary extravasation, is in my mind easily explained by reference to the relative degrees of vitality, which they both possess. When you consider that the former is much more highly organized than the latter, you will not feel surprised to hear that the peritoneum may resist the disorganizing consequences of an inflammation which would prove destructive to the component parts of the scrotum. Gentlemen, you may probably consider that my observations to-day have been of a very desultory and heterogeneous character, but when you reflect upon the variety of topics, and the numerous cases, which is the my daty to discuss, I trust if the discuss, I trust if the discuss of the content of the c

CASE OF CATALEPSY

COMPLICATED WITH

HYSTERICAL SYMPTOMS.

To the Editor of THE LANCET.

Sin,-Having read with considerable advantage the two cases of catalepsy recently reported in THE LANCET, I am induced to forward to you the following case of the same affection, which, if it he considered interesting enough, I beg you will insert in your truly independent periodical. I have the honour to remain, Sir, yours respectfully.

John J. Kelso, M.D. Lisburn, Sept. 14, 1835.

Miss B., et. 19, is of a delicate make of body, with light-brown hair, fair complexion, and of a nervous temperament. Previous to the commencement of her present illness, she enjoyed, for the most part, tohrably good health. On the 21th of December, 1834, I saw her for the first time, and found her in the following condition: She was of conscioueness and sensibility; the muscles of the extremities &c. were quite flexible; the respiration about four in the minute, the heaving of the chest being scarcely recognizable; occasionally, a short expiration, with a sigh or a moan, succeeded to a deep and sonorous inspication. Pulse 60, fluttering and weak; skin rather cold and exsanguincous. Intense cophalalgia, as evinced by the occasional involuntary application of her hands to the forebead, which she would violently press until they were removed by some of the attendants. Eyelids closed, and on being raised up, the eyeballs are found strongly turned upwards; pupils dilated and fixed. Peculiar placidity of countenance. Catamenia &c. regular. This cataleptic state persisted for about nine hours, terminating in a confused sleep. The prostration at one time was so great that it was thought she would sink, the pulse having become imperceptible, and the respiration for nearly two minutes wholly suspended. Dr. Thomson, who had previously seen the case, had ordered a fetid enema, and leeches to the temples.

27. The catalepsis, which is almost continual, is now announced by the loss of command over the voluntary muscles, the head falling back, the eyes closing, and the other taking sulphate of quibine, which has been increased to Di daily, with hut little benefit.

A taking sulphate of quibine, which has been increased to Di daily, with hut little benefit.

March 27. For the last few days the fits the strongest stimuli; health was improving with her appetite,

headache relieved by the leeching, but sometimes excruciating; tongue clean; appetite good.

30. The fits to-day are hardly so frequent, or of such long continuance. During the attack she sighs or moans frequently, and, if mild, music will attract for a little her attention. The striking of the clock, too, will occasionally make an impression upon her, the strokes of which she will accurately count. On recovering from the seizure she instantaneously regains possession of all her faculties, and during the intervals between the paroxysms her spirits are good, and she employs herself in reading. Headache teasing, and there is globus hystericus. Restless nights. Sumat Tinet. Humuli 3ij, hora somni.

Jan. 5, 1835. The beadache and globus hystericus are peculiarly distressing during their existence, and for an indefinite time after the passing off of the fit. Pain of a neuralgie nature is felt in the course of the infraorbitar nerve, and she frequently experiences tooth-ache, which always aggravates her

state. No other alteration.

Feb. 15. On those days on which the fits are fewer they are invariably longer protracted, and rice rersa. They have assumed a periodical character, invading at one lving extended on her back, perfectly mo- o'clock and at seven p.m., persisting genetionless, with complete deprivation both rally at cach time for about three hours. During the rest of the day she is completely exempt from their attack. She has been taking the earb, of iron, which has been increased to 5viij daily, without producing much benefit. It may be remarked that the morning which is ushered in with violeut headache, invariably effects an irritability of temper, with a protraction of the tits, and an increased amount of suffering generally during the whole of that day. Appetite defective; bowels preserved relaxed by suitable aperients. Sleen still to he solicited by the anodyne.

> 27. The fit is announced by the fixing o her eyes on some imaginary object, either on the ceiling or the wall, which she w continue, as it were, attentively examining with a smile or a laugh, pointing to it at th same time with her finger. In this attit. she will remain until recovering from th scizure, when a convulsive tremor ensues, with the effusion of abundance of tears and frequent sighing. To-day the recovery from the fit is aunounced by a difficulty of obtaining breath, as it were, accompanied with a violent and frequent heaving of the chest, so that the respiration would appear to amount to 90, or more, in the minute. This state persists for three or four minutes, and then passes off in sighing. She has been taking sulphate of quivine, which has been

ever, she became suddenly and unexpectedly improving, from a residence, for these last worse. The catalepsis was preceded by a general convulsion, which lasted for nearly an hour. If she happens to be in the erect posture when the convulsive paroxysm invades, she becomes so rigid as to render abortive any attempts to hend her: again, if she be reclining, the flexor muscles of the trunk, by an instantaneous and violent effort, will elevate her into the semi-creet state. There is tenderness in the spinal column generally, but especially acute over the which is evidently depressed, and all the lumbar vertebræ. Pressure, if practised on any of those tender parts, excites acute pain and a sense of constriction, as if the body was ligatured by a cord; it invariably ev-Hirudines x dolent, partibus dorsi.

elevated, with a remarkable frequency and resulting from the displaced vertebra, which posture.

the convulsion and jactitation, entirely gave But although the displaced way in the beginning of July. The cata-turning to its appropriate

from the taking of exercise. To-day, how- | lepsis is yielding, and her general health is two months, at the sea-shore. I may mention that about a month since she experienced an attack of toothache, which so much aggravated her state as to render the catalepsy almost continual for the then four consecutive days. The tenderness in the spinal column has nearly disappeared, and the displaced vertebra is fast returning to its natural position.

Remarks.-The case just detailed I consixth and seventh cervical, the tenth dorsal, sider not only interesting but instructive, from its intimate connexion with acute spinal irritation, and the palpable displacement of one of the dorsal vertebrae. Although we find hysterical symptoms frequently, if not invariably, associated with cites a fit, or the convulsion terminating in catalensy, -affections, it may be observed, it. It was mentioned to me now that about not very dissir iter in their nature and seat, tightmonths previously, a tumour, of the size it can hardly be supposed for a moment of a fowl's egg, was developed, at about the that they originate from an analogous situation of the depressed vertebra, but discounse. It is pretty generally admitted, that - it can hardly be supposed for a moment appeared after some time, spontaneously, irritation, in what yer assumer excited, act-Intense headache, with feverish excitement, ting on the origin of the spinal nerves, in [predisposed habits, is the pranary and chief 30. The convulsive paroxysm, which is cause of the development of hysteria; but not so furious, is sumetimes alternated with since that affection presents itself so frejactitation. Nights dis-turbed by alarming dreams, rest not being tion. What has been here advanced, howprocured, as was wont, by the anodyne, ever, does not in the least militate against There is general screness over the surface of wint must be acknowledged as a fact, in my patient's case, viz., that irritation in the April 5. The catalensis very frequent, medulla spinalis, or the origin of those lasting for about ten minutes, and the connerves is using from it, excited trans whatvulsion or jactitation which always precedes surver cause, was an essential link in the chain it, about six minutes. The nights are not of causation, for the high degree of tenexempt now from the fits, which the least derness in particular parts of the spinal mental excitement will produce. The pant- column, on making the least pressure, so ing respiration frequently recurs, during suddenly set up on the 27th of March, which the chest and abdomen are alternately a from improduct exercise, with the irritation violence. Spine very tender. Habeat most was then detected for the first time, were chi grs. vi, ter die. To keep the recombent accompanied by a marked aggravation of the catalepsy &c., and the development of May 5. An uncontrollable propensity to the convulsive paroxysm. The intensity of straight-forward progressive motion during the affection, too, yielded on instituting that the existence of the catalepsis. Spine less appropriate treatment for the removal of tender, from repeated leeching, emping, and the local irritation, which being in great blistering. Pulse not affected during the measure effected, the convulsive fits and jactitation, which was occasionally violent. 20. The tendency to straight-forward pro- entirely ceased. It is to be regretted that gressive motion has disappeared. To this the spinal column was not subjected to an has succeeded a rotatory, whirling, round- earlier and accurate examination respecting about motion, which is always executed its real state. It must, however, he quite from right to left. During the fit she will evident, that the irritation or inflammation continue, to all appearance, reading, or fol- which led to the slight angular curvature, lowing any employment she may have been must have existed for some time, and very engaged in prior to its occurrence. Much probably from the period of the existence of the tumour on or hear man place, which september 1. The rotatory motion, with was, as reported, about eight months before

ther parts of the spine has nearly disappeared, the catalepsy still persists. This nay arise, I think, as much from the mor-oid habit established in the system, as from the continuance of the cause which originally called it into existence.

The headache, all along a peculiarly prominent and harassing symptom, may be Rwed as sympathetic on the spinal irritation, and the straight-forward and rotatory motions are referable, I conceive, to irritation influencing the origin of more or fewer of those nerves which are subservient to locomotion.

With regard to the treatment of the case. those means which were employed for combatting the local irritation in the spinal region were the most beneficial. The inter-nal remedies were not equally efficacious. These were chiefly carbonate of iron, quinine, camphor, ether, and musk; and although several other things were prescribed, she obstinately refused taking any of them.

. CASE, PREQUENTLY

SIMULATING HYDROPHOBIA.

To the Editor of THE LANCET.

Sir, - In the number of The LANCET published on the 29th of August last, I saw an article entitled "Remarks on Pseudo-Hydrophobia, by Dr. Hare," I must certainly agree with the Doctor in thinking that the case related by Mr. Tomkin in THE LANCET for August 15th, was "one of those mysterious neuralgie diseases which medical men sometimes meet with;" and a case fell under my observation last year which the remark of Dr. Hare brings to my recollection. I remain, Sir, your obedient servant.

J. L. M'CARTHY, M.D. Macroom, Sept. 14th, 1835.

A young and fine-booking man, a soldier in the 70th Regiment, belonging ton detachment of that corps quartered at Millstreet, about fourteen miles from the place, was sent in here by the apothecary in charge of the troops at Millstreet, for the purpose of being transmitted to head quarters in Cork. Lieutenant Jameson, commanding the detachment of the 70th, which was quartered here, called on me and begged that I would go and see this young man, who he said was reported to him as having hydrophobia.

icute Cenderuess experienced there and in a convulsive fit, struggling violently, howling and barking like a dog. He attempted to bite at every thing placed near his mouth, and the slightest blast of cold air, or the sprinkling him with any kind of fluid, aggravated the fit. His respiration was extremely irregular and convulsed, and he frothed considerably at the mouth. At the same time he was, to a great degree, conscious of what was going on, and would, when the snasm nermitted, answer questions that were put to him. He complained of great pain in the back of the head, along the spine, and in the epigastric region. The sergeant of the party told me that the fit had now lasted nearly an hour, and that the patient would soon fall asleep, as he was showing signs of faintness. I staid with him about half an hour, when the convulsions gradually abated, and he sank into a deep natural sleep. I then felt his pulse, and found it full, hard, and counting 97. The sergeant who had accompanied him from Millstreet told me that his bowels were most obstinately constinated.

I recommended Mr. White, an apothecary in this town, who had the medical charge of the troops here, to have him bled freely, and to give him a strong bolns of calomel jalap, camphor, and ginger, to be followed by an enema containing castor oil and oil of turpentine. Mr. White, however, did not think proper to follow my advice, and did nothing for the patient, simply reporting the case to the chief military medical officer in Cork, in order to have the man removed to the General Hospital.

When the patient awoke from his sleep, which had continued for four hours, I again went to see him, and obtained a history of his case. He told me, that when a boy about ten years old, he was bitten in the hand by a dog which was supposed to be mad. The dog was killed immediately afterwards, but it was not properly ascertained whether the animal was really rabid or not. The wound became very sore, and festered. It was canterized by a surgeon, and then tormented by the application of various continents, and at last, being ultimately left to nature, healed, and cicatrized in about three weeks. The accident occurred in the month of Jamary, and some time in the following May he was attacked with symptoms so like those of hydrophobia, that the medical man who attended him at once pronounced it to be that disease. He did not recollect any-thing of the treatment he then underwent; but in about a week from the commencement of the attack he completely recovered. He had then two of the convulsive fits in the twenty-four hours, and they were, he said, precisely of the character of the one which I accordingly with Mr. Jameson to I saw. He further stated, that the convulthe harracks, and found the patient bound sive fit was always preceded by a sense of the harracks, about swisted round suffication, tightness across the chest, a He was then in heavy weight at the epigastrium, extreme

difficulty of deglatition; and a feeling of hor- | could with safety pronounce whether a ror at the sight of fluids; but that when the fit went off, he found himself quite well, but exceedingly weak, and able to swallow both fluids and solids, with the same facility as when in a state of health. He was at that time in his 19th year, and he said that he had, since his first illness, experienced an attack of this disease regularly every spring, and also sometimes in the autumn; during the intervals he always enjoyed robust health. His illness was always pre-ceded, for some days, by constipation and irregular digestion, which also accompanied the attacks, and free purging gave him the greatest relief.

He remained here for nearly a week in this state before he was transmitted to Cork, and the fits were daily getting worse, as no treatment was adopted. I afterwards learned, that being put into the Cork General Military Hospital, he was bled and purged, and perfectly recovered.

I asked this young man why he barked and howled while in the fits, and he told me that he always fancied there was a troop of mad dogs about him, but that in every other respect his mind was unaffected. He said that two medical gentlemen who had attended him in two different attacks, both stated that his case was one of hydrophobia, and was cured by them.

I consider this affection to be one analogous to the hysteria in the case related by Messes. Tomkins and Varenne, and to have been originally caused by the bite, and the irritable treatment of the sore, afterwards recurring from habit and disorder of the digestive functions, the affection assuming a periodicity in its type.

HYDROPHOBIA.

REMARKS BY MR. VARENNE ON THE ARTICLE BY MR. YOUATT.

To the Editor of THE LANCET.

SIR,-I should feel obliged if you would insert in your valuable pages the following brief remarks, which bear reference to some observations on a case of supposed hydrophobia, contained in your 624th number.

A point of interest, with respect to hydrophobia, rather overlooked by the writer of those observations, remains yet to be examined; and that is, how long before decided symptoms of that disease make their appearance in an animal, is that animal capable of affecting the system of man or of case are never so constant, in all cases, that take place in the circumstant even an experienced and skilful veterinarian that the numerous

"sickly dog" was capable of producing hydrophobia by its bite or not. And herein consists the difficulty; for it has happened, as most people are aware, that, sometimes, at the period of inflicting a wound which has afterwards proved mortal, the animal has been actually unsuspected; and therefore we may conclude that in the woman whose case has been the subject of controvercy, the symptoms having been plainly those which are considered to be normal by the generality of medical authors, the circumstance of the dog not being mad at the period of his death, is no certain proof that the system of the patient was not affected by his virus. Had she died, perhaps the case would not have been considered so doubtfist.

When we consider that the slight scratches made by the dog's tooth, appeared inflamed on the 8th of August, after having been completely healed since the 24th of the previous July, it must be acknowledged that there was something more in the wound than is usually met with in simple abrasions of the skin, whether caused by a dog's tooth, a nail, or otherwise; and also when we pass in review the concurrent symptoms, there seems to be some, it not strong reason, in opposition to the opinion of Mr. Youatt, for the assection that there were decidedly symptoms of hydrophobia in the person attended by Mr. Tomkins and myself. I have the honour to be your obedient servant, E. G. VARENNE.

Kelvedon, September 17, 1835.

ON THE NATURE OF

INFLAMMATION AND IRRITATION.

To the Editor of THE LANCET.

Sin,-In requesting the favour of your allowing the subjoined paper to occupy a space in your Journal, some apology is necessary for adding to the number of attempts to explain the nature of inflammation, the more so, since the present inquiry is far from being complete. It forms merely a link which could not with propriety be excluded from a series which will hereafter compose a work on the treatment of inflammatory and febrile diseases. I am, Sir, yours respectfully,

HENRY SKARLE, Kennington, Sept. 19, 1835.

In the various descriptions which have other animals with the disease in question? been given of the section of inflammation, It may not be impertinent to state, that the so much importants had been ascribed to symptoms of what is called the latent dis- the changes which have been supposed to

It is such employed in the investigation of the therefore not surprising that the grand circulation, the doctrine of obstruction has point of ioquiry should have hinged upon again become prevalent. this turgescence.

with their respective modifications. The is true, that on the targescence of the ves-former, the doctrine of obstruction, was sels depends the chief, if not all the external, first broached by Boerhaave, who attri- signs of inflammation, and on this very acvessels too small for their transmission, re- the key to the true theory of inflammation. unired an increased action of the heart and arteries to overcome the obstruction. Culthe obstruction to the vessels themselves, instead of to the blood, and attributed the

obstructed circulation have since appeared; cating the existence of inflammation. debility in various degrees, even to atony of the small arteries, has taken the place of spasm, an increased action, however, of the tial to these productions, many familiar exlarger arteries being retained as an essential part of the hypothesis.

The other leading hypothesis-viz. that the turgescence arises from an augmented flow of blood through the inflamed part, not the effect of an intermediate inflamma-was established by Hunter. There were tory process of the bloodvessels. In irriseveral reasons for this doctrine obtaining tative fever, as it is called, collections of our almost universal assent; it was described by teachers as consisting of a simply increased action of the arteries, including those leading to the inflamed part, as well monons inflammation; but so soon as these as those engaged in the inflammatory action; the simplicity of this view readily superseded the incompatible notions of an obstruction of an angmented flow of blood coexisting in different parts of the same formed without betraying any symptom of chain of vessels; surgical facts daily confirmed the idea of an augmented flow of blood through the inflamed part, and the appa- ceptions to the general rule, yet they suffirent increase of vascularity was an almost ciently prove that the morbid productions positive proof this being the case. The of inflammation do not depend either on authority of the atteries, or on

On reviewing the different hypotheses this turgescence. The turgescence can arise only from an respecting the nature of inflammation, on obstruction, or from an augmented flow, of common error presents itself, viz., that of bloud through the vessels; and from the endeavouring to trace all the phenomena of views taken of these two opposite states, inflammation to a particular state of the cirhave originated the two leading hypotheses | culation; but such a state does not exist. It buted the accumulation of blood, forming count it has been the stumbling-block of the turgescence, to an error hed of some of many distinguished men, who have vainly its particles, which, becoming impacted in sought for the cause of the targescence as

It is supposed that inflammatory action occurs in the following manner:-That an len modified this hypothesis by ascribing adequate excitement of the nerves of the part causes certain changes in the circulation of the blood, evinced by the more usual proximate cause to "a spasm of the extreme signs-redness, tumefaction, pain, and inarteries, supporting an increased action in creased heat, and that this particular state the course of them." Various modifications of this doctrine of tion of the various morbid effusions, indi-

> In order to prove that a preliminary stage of inflammatory action is not essenamples may be given. In cases of scalding, the effusion takes place immediately on the application of the stimulus of heat, as the direct effect of the nervous excitement, and sometimes occur in distant parts of the hody without being preceded by redness, throbbing pain, increased heat, or other sign of phlegcollections produce a certain degree of distention, their existence is indicated to the patient by the unensiness they create. In the same manner chronic abscesses are often arterial irritation.

Although these examples form mere exnedical classes as Huntar was not likely to any other change in the circulation, but that his own day; various they are the results of a morbid function of the secerning vessels. It is true that a local

excited action of the arteries mostly precedes the morbid effusions, but it would appear that these are distinctly different effects of the same cause: for, an increased action of the arteries alone, or a morbid function of the secenting vessels alone, or both these effects conjointly, may arise from one and the same cause. The following comparison between irritation and inflammation will tend to elucidate this view of inflammation.

IRRITATION consists in a simply excited action of the minute arteries, unaccommunied by derangement of their secerning extremities,

INFLAMMATION oppears to consist essentially in functional derangement of the secerning ressels, which, in most instances, is accompanied by an increased action of the

Simple arterial irritation occurs under a great variety of circumstances. It may be momentary-the most transient and trivial deviation from healthy to higher vascular action is witnessed in the blush occasioned either by mental emotion or gentle friction; - or it may be durable-the crythematons patches or mucous membranes irritated by the contact of vitiated secretions, may exist for years without assuming a strictly inflaminatory character.

This simple vascular irritation may be cither local or general: it may present itself diffused exanthematous form of rubedla, or of scarlatina.

General vascular irritation may occur either in paroxysms or in continuous forms. The paroxysms may be produced by mental emotions, by taking certain stimulant and sudorific medicines, cordials, as wine, spirits &c.; they may be induced by a sudden check to the circulation, such as is occasioned in cold bathing; they are often periodical, as in intermittent and hectic fevers. The continuous forms are observed in pyrexia. Many other examples of increased action of the whole arterial system might be given, in which no particular functional derangement of the secerning vessels can be connected with it, so as to constitute inflammation.

INFLAMMATION appears to consist essentially in functional derangement of the secerning vessels, combined, in most instances, with the arterial irritation already described.

According to this definition of inflammation, the morbid action of the secerning vessels is the essential part of the inflammatory process. So inessential, indeed, is arterial irritation to the existence of inlymphatic glands, abscesses, adhesions, tubereles, interstitial depositions, accumulations of lymph, serum, or pus, opacities, indurations, softenings, and other organic changes; any of which may take place without a sign being evinced, even to the patient himself, of the existence of the slightest arterial irritation. How incorrect then, and at the same time how delusive, a definition of inflammation is that which limits it to an increased action of the arteries, that arterial irritation often occurring without inflammation, and inflammation sometimes existing without any apparent arterial irritation! Consequently no fixed correspondence is preserved between the supposed cause and the effect, if such a relation can be established between them.

Inflammation distinguished from irritation.-Inflammation is in general more durable than irritation. Inflammation is almost always idiopathic. Irritation is very frequently sympathetic. Inflammation is always local; irritation may be either local or general. Irritation often exists without inflammation, but the latter is usually preceded and accompanied by the former, same cause, in different degrees, may produce either simple irritation or inflammation. For example: if a portion of the skin be subjected to the influence of friction during a minute or two only, simple arterial irritation will be the result; but if it be as a more crythematous speek, or in the subjected to the same agent during fifteen or twenty minutes, inflammation also will take place, and a blister be formed; anger may occasion merely a momentary irritation of the vessels of the brain, or it may produce a decided phrenitis. So any other cause, as heat, may occasion a temporary irritation of the arteries only, or its influence may extend to their secerning extremities, and disorder their function, constituting inflammation. Irritation may be in sympathetic connexion with inflammation. For instance; a suffused redness of the face and neck may coexist with cynanche tonsillaris; or an erythematous patch on the check may attend inflammation of a tooth or of the gum on the same side, and various cutaneous irritations may accompany gastro-enteritis, or other internal phlegmasia; but the most extensive and dangerous form of sympathetic irritation, is that which is connected with acute visceral inflammation, and presents itself under the character of inflammatory fever.

Acute inflammation in a part is always accompanied by irritation in the contiguous parts, and these diseased actions sometimes preserve a distinct coexistence in different flammation, that various changes of struc-ture occasionally take place without any For example; the subarrancellular tissue appreciable increased action of the arteries. Most unequivocal results of inflammation while the mucous members of inflammation are sometimes discovered in the head, chest, and although a sometimes also consider the solution of the soluti and abdomen; such as enlargements of the be explained on the

increased vascular action constitutes inflammation. In this case the submucous tissue, the seat of inflammation, becomes changed in structure,-the mucous membrane, the seat of irritation, continuing in its natural condition. In the same manner the cellular tissue of the liver may become inflamed and thickened, or any kind of deposition may take place into it, the lobules at the same time being in a state of mere icritation or active congestion, and secreting bile natural in quality and quantity.

RESEARCHES INTO THE DISEASES OF CHILDREN.

CONDUCTED ON THE

KNOWN PRINCIPLES OF ANATOMY AND PATHOLOGY.

WE intend to publish at intervals, in the numbers of the present and ensuing volumes cough was moist, and did not at all present of The Lancet, a series of cases illustration for the most important diseases of chillittle harsh and hoarse. The disease dedren, observed at the Hôpital des Enfans clared itself suddenly on the night of the lieve, in Europe, in which children of from the following symptoms: three to fifteen years of age are received. Our reports of these cases will, we expect, he very acceptable to British practic land a moderate access of sufficient. The tioners, to whom we present them as original access was soon repeated, and lasted for a communications, drawn up with great care, with a view to recording facts from which important practical rules in the treatment obstructed respiration. The latter, in the of the diseases of children may be drawn. In mentioning that these cases are expressly and accompanied with forced dilatation of reported for publication in our own columns, we do so simply to prevent any erroneous impression which may chance to be created with regard to the authority of reports of foreign cases in an English journal, in consequence of a habit which has prevailed in cannot therefore note the character of the some quarters, of extracting hospital cases from a Parisian contemporary (the Lancette Français) without acknowledgment. -- a piracy which has excited much complaint from their author in the French journal.

commence the series this week by giving the following case, to which we take the opportunity of attaching the name of its Athor, a gentleman of extensive acquirements and great research in medicine, and well competent distance and apply the facts which and onthology can

HOSPITAL OF SICK CHILDREN, PARIS.

INFLAMMATORY CROUP .- TRACHEOTOMY .-CURE OF THE CROUPAL SYMPTOMS .-DEATH FROM CAPILLARY BRONCHITIS ON THE NINTH DAY AFTER THE OPERA-TION --- AUTOPSY.

ALEXANDER GUYON, a boy four years of age, was received into the hospital under the care of M. GUERSENT on the 2nd of June, 1835. The parents of this child are both healthy, but he himself is in general subject to ill health; his chest is very narrow, and the sternum projects slightly forwards from lateral compression of the chest; the child however does not cough habitnally. For the last six or seven days the child has been affected with the symptoms of common catarrh, to which latterly some feverish symptoms were added. He was seen in town, on the morning of the 2nd, by a physician, who did not say any thing about croup, or seem to suspect the existence of this disease: at five o'clock in the evening the interne assures me that his Malades, in Paris, the only hospital we be 2nd, and at nine o'clock on the morning of the 3rd, the little patient presented us with

The face, which is habitually pale, is now few minutes, during which the child is very much agitated, tosses about from side to side in the bed, and suffers evidently from intervals of the fits, is laborious, abdominal, the nostrils, fourty-four in the minute: a sonorous raic passes in the back of the narcs. The child coughs a little, every now and then, for a few seconds at a time, but the cough has not the crowing character remarked in croup; he does not speak, we voice. The motion of the child when the access of suffocation comes on is very characteristic: he begins to writhe about in the bed, cries, and endeavours to obtain the npright position, but when taken up and held at the window, the fit very soon goes off. In accordance with our arrangements we The crachoir (tin spitting-cnp) contains a quantity of nearly clear-coloured serous fluid, in which we observed floating a portion of white false membrane about three quarters of an inch long by a quarter of an' inch broad. On examining the back of the fances we find a small patch of the same pseudo-usembranous concretion covering the left amygdala. The chest sounds well upon percussion, we think however there is some little matity on the right side above and

souffic bronchique in other parts of the aii; simple lavement; diet. chest a rûle sibilant. The skin is very moist 5. The second day after (and warm, pulse small, 140, respiration passed nearly in the same state as the now 48.

On examining the patient M. GUERSENT pronounced the disease to be croup, and ordered the operation of trachcotomy to be performed without delay. The little patient was carried at once into a neighbouring room, and the operation performed by the interne. The child lost some blood from the division of the veins about the lower edge of the thyroid gland, which scemed to us also to have been divided for a few lines, and before the canula could be introduced into the trachea, a good deal of blood had made its way into this tube, and brought on such a fit of coughing and suffocation that we thought every instant the child would have died under the knife; this state, however, fortunately went off after one or two violent accesses; the canula was introduced, and the patient quickly restored from a condition of the greatest agitation and suffering to comparative calm: in a few minutes after the operation, the pulse, which, counted immediately before, gave more than 140 beats, fell to 116, the respiration descended from 48 to 32, and we left the child enjoying a quiet sleep.

4. When we first saw the patient this morning, he was lying asleen; the face was free from moisture, the skin not very warm: the respiration sufficiently calm, and accompanied with a gentle dilatation of the nostrile, 36; the pulse still small, 152. The child soon awoke, and M. GUERSENT coming in, we learned that the chibl had coughed a good deal during the night, and passed some large portions of false membrane through the canula. This latter tube now became stuffed with thick mucus, and the child was seized with a fit of suffication very analogous to those we observed before the operation; the face does not become purplish as then, but the child makes violent efforts to respire; his whole hody is bathed in sweat, and at each effort the air, mixed with mucus, hisses through the canula with amazing violence; in a few seconds the canula hecame pretty free; the respiration was then less difficult, though M. Guer-SENT says the breathing is almost as oppressed now as it was before the operation. The canula was now cleaned with a morsel of sponge on a bit of whalebone; this caused some agitation, and the pulse rose to 156, respiration 44; a great quantity of greenish muens, mixed with little or no air, is driven through the tube at each expiration; the child is not very weak, for he stands up in bed without support. Skin org. Antim. gr. xvi. alk and water. noist, not very hot. The crachoir contains several portions of false membrane expectorated during the night; one of which is at played for a true for the standard water. least two inches long. Decoc. Malva for ing, when he we

posteriorly: at this point we have some drink; Solution of Gum with Ox. Antimo.

5. The second day after the operation was former; the respiration, however, became somewhat less embarrassed; the patient discharged from time to time through the canula complete tubes of false membrane, as if derived from the second bronchial division. Decoc. Matric; Solution of Gum with Oxy. Ant. xv gr.; simple lavement.

6. The patient looks much more calm to. day than yesterday or the day before; his respiration is also much less laborious, is regular, 38, a few minutes after the cannia was cleaned; the patient passed several hours last night in a state of perfect calm; at each expiration a small quantity of greenish mucus is driven as far as the orifice of the tube, but not forcibly beyond it; the appearance of the wound, which is about two inches and a half long, is good, but the skin is somewhat retracted from the edges. and leaves the subcutaneous tissue bare; the child had a fit of coughing during the visit, which brought away some false membrane; the fit was slight, continued only two or three seconds, and did not give rise to any coloration of the face or mouth; however, we may remark that to a non-medical person or parent Ac., the child would have appeared to suffer excessively, from the circonstance of his making all the motions which accompany cough in the ordinary state without opening his mouth, or of course producing any sound whatever; the skin is moderately warm, moist, and in some parts covered with sweat; the skin of the forehead is much warmer than that of the face, but not more so than that of the hands or the rest of the body; pulse 144; two stools during the night; in respiration the lips do not maye, but we observe a curious physiological phenomenon which we did not notice before, and which, as far as we know, has not been remarked in other histories of this operation. The unstrils move, evidently as if the patient respired through the month and nose, but on close examination we find this motion, though pretty regular, is not exactly that of respiration, nor corresponds exactly with each elevation of the chest; the dilatation, er, to give a better idea of the motion. the elevation of the nares, corresponds pretty nearly to each inspiration, but on the whole is slower, and every now and then the nares when drawn up make two or three short fluttering inspiratory movements and then subside; for the last two days the respiratory sound has been obscure at the summit of the right lung. Decoc. Malow ; Sirup of Gum ; Sol. Gom.; with

arly this morning was 120 to 124; is now at home. The inspiratory motions of the has had no fit of coughing this morning, wound looks well, does not suppurate; the nd his respiration is now sufficiently free; cervical and submaxillary glands are not tupassed some small fragments of false membrane last night through the canula; broth. his morning he ate half a biscuit with some Oxid. Antimon, xviii gr.

8. The fits of suffocation now no longer false membranes have been passed; the pa- broth. lient is now very feverish; skin burning hot; pulse 111 (this morning at one o'clock t was only 120 to 128); great thirst; respiration not much oppressed, 48; the nostrils whibit the same motions as yesterday, corespending very nearly with expiration; no ir whatever passed through the mouth r nose. M. Guersent observed that he cared the child was now evidently affected oth another disease than that for which the peration was performed, and would die med of his croup. Dervet. Mair v : Ox. Intere, xviii gr.; lavement; milk.

9. The child does not cough much,—only hree or four times in the course of the day; the child looks much better than bepanging out the camda in the trachea); the child was not very thirsty during the brane. hight; the respiration not laborious, is irrepdar, 48; skin moist and very warm, as efore; he has not expectorated any false embrane since; a greenish mucus is still ischarged from the canula, but after it was caned out with a sponge two or three lines, we observed that the nateus expecprated became rosy; the patient has eaten one current jelly with great relish. Oxide lulimony xviii gr.; currant jelly.

10. Seventh day after the operation. The hild lies perfectly quiet in bed, and pre-Ints a strong contrast to the agitated state which we found him on the first day of is disease; the respiration, though a little nick (38) and irregular, is not difficult. The unda was stopped this morning for an our; he hore this very well, and the inrne says his respiration immediately beone more slow and easy. The cough has uch diminished, the patient now only ighs to expectorate some mucus; is less ty; skin still moist, but excessively ; pulse sharp, pretty strong, 132; face lost all appearance of agitation; not y pale; the children with some appearance of agitation; not y pale; the children with some appearance of the children was passed to the children with the children was passed to the children with the children was passed to the children with the children was passed to the children was passed to the children was passed to the children with the children was passed to the children was passe

28; the respiration 32 to 36; the patient nostril are now much les perceptible; the

11. The patient has coughed very little appetite; the skin is moist and very slightly during the night; skin not so warm as warm; there is still some dulness of sound yesterday; pulse 120; respiration 48; on ansand absource of vesicular respiration at the cultation we hear some dry crepitating rale summit of the right lung. Same remedies; in the right lung posteriorly; the canula has been stopped several times since yesterday, and the interné again assures us exist, but the child had a long and violent fit that the respiration becomes more slow of conglining during the visit; the canula during that time; skin not very warm. Wine hoes not discharge much mineus, and no new an I water; Ox. Antim. gr. xij; chicken

> 12. The canula was removed yesterday, and has not been replaced since; the cough is not distressing or frequent; however, the respiration has been embarrassed from time to time, especially during last night. It is now a little difficult, 48; pulse small and very rapid, 136; skin rather cool. The child has had a good deal of diarrhea; five liquid stools; tongue white, but moist and not foul. From this time the child began to sink rapilly; the respiration became more difficult, and he died without convulsions during the night.

Autopsy at ten o'clock on the 13th of June.

Carity of the Chest .- The left lung looks ore, and lies quite quietly in his bed; little healthy externally; the right lung is of a appetite; pulse now 140, was only 116 this mottled red colour in front, and adheres morning (perhaps from irritation caused by to the parietes of the chest, anteriorly and laterally, by a pretty extensive false mem-brane. There is no effusion into the cavity of the chest. The trachea when opened does not exhibit any trace of false membrane; there is no inflammation immediately about the edges of the divided rings, but about two inches lower down than the inferior angle of the incision, there is some irregular capillary injection, with two or three points of ecchymosis in the lining membrane; there is also some ecchymosis above the wound, with some capillary injection round it. The whole of the bronchi, from origin to termination, are deeply injected, and when divided near the surface of the hour they discharge a moreo-purulent fluid. and seem somewhat dilated; no false membrane in any part of trachea or bronchi. On again examining the trachea we perceive on the right side of the incision that the mucous membrane is of a rosy colour, for about one inch in length by a half in breadth: the menibrane then exhibits a vellow colour, as if it had been bathed in pus for some space down, and then the membrane again becomes injected about an inch above the division of the bronchi. The whole inner surface of the traches is rough to the feel, and looks cools, one of here and there as if the nincous membrane mears that had been removed, but there is no trace irtying his bed | whatever of ulceration. When the summit

of the right lung is divided, it presents a Here and there some of the tubercles are gray-yellow colour, from the inditration of softened, and discharged their pus ento the tubercular matter; the appearance is different from that of Igray hepatization; the tissue is here soft, and yields under the finger with readiness; on the right lung brane; nor do we find any in the pharynx; also, about a quarter of an inch from the surface of the lung, and situate near the lower edge of the part adherent to the cost larynx externally, i.e. the crico-arytenoidal tal surface, we find a tubercle, in a crude surface, is very much injected, purplish and state, about as large as a five-sons piece; wrinkled like a piece of half-dried parch; and near the supmit a number of smaller; ment. No injection or annearing of false and near the summit a number of smaller ment. No injection or appearance of false tubercles. Here some points of the lung membrane about the larynx or cordæ vohave a solid feel, and are much engoue, but cales. do not give way under the flugor, or present the dark colour of an hepatized lung. Inferiorly in this same right lung the small softened, but presents no trace of inflambronchial tubes are excessively injected mation. There was nothing worthy of detailwith a deep-red capillary injection, and the jing in the viscera of the abdomen or head, tubes, when the lung is squeezed, give out a quantity of bloody mucous fluid, mixed here and there with some pus from certain of the bronchi. Between the upper and middle lobes of the right lung behind, we find some false membrane, which partially unites them together, and also to the side of the chest. tent, the substance of the lung round the Hepatie disease in India. RESEARCHES INTO THE DISEASES OF CHILDREN.

CONDUCTED ON THE

KNOWN PRINCIPLES OF ANATOMY AND PATHOLOGY.

HOPITAL DES ENFANS MALADES. PARIS.

CROUP.

In France the name of "croup" is confined exclusively to inflammation of the larynx and trachea, accompanied by a pseudo-membranous exudation. During the last five years this affection had been extremely rare at the Hopital des Enfans, and not more than three or four cases were observed; but it presented itself much more frequently in the course of the year 1835, during which we have observed no less than ten cases, affecting children from two to six years of age. The treatment employed in the majority of these cases consisted in the use of emetics, purgatives, local bloodletting, and cutaneous revulsives (blisters to the pole or front of the neck, to the superior or inferior extremities, &c.) The operation of tracheotomy was performed four times, and always accompanied by a momentary improvement in the symptoms, but the cases have nevertheless been fatal; in two patients death took place about thirtysix hours after the operation, once in fortyeight hours, and in the fourth, whose history we have already published (see p. 29), the fatal termination did not arrive before a lapse of eight days. In some of the cases shove enumerated the diagnosis was atbove enumerated the diagnosis was at of a hourse dry cough; alteration of the tended with considerable difficulty: thus, in voice, which is weak and barking; pulse one case, we have the physician attached accelerated; skin hot; intelligence perfect. to the hospital makes the croup for an plottidis); we nader the chin.

have also seen a case of simple inflammation of the larynx and trachea mistaken for croup; we shall report the latter case after having detailed one which did not present the slightest doubt, from the well-marked symptoms by which it was accompanied.

CASE. - Child five years old. Cough and hoarseness at the commencement; emetic; amelioration for two days; then alteration of the timbre of the voice; croupal rough; expectoration of false membrane; two applications of leeches to the neck; frequent emetics. Death on the seventh day; membranous concretion in the larynx and trachea; puriform mucosities in the bronchi.

Delorme Antoinette, a girl five years of age. of a good constitution, was seized on the 21st of August, together with one of her sisters aged two years, with cough and hearseness, and dyspuces. A physician being called in, prescribed an emetic for both the children; the accidents increased rapidly in the case of the younger child, who died with the symptoms of croup in three days. The elder sister felt some relief from the effects of the emetic, which persisted on the 26th and 27th, but on the following night she was seized with a frightful access of dyspnæa, which determined the parents to transport her to the hospital. the patient's arrival she was immediately given an emetic, which produced copious vomiting, accompanied by efforts to cough; in the midst of the matter thrown up was found a morsel of false membrane, organized, and as large as the thumb nail.

29. At the visit in the morning we found the child lying on the right side; the head thrown back; the face pale; the neck tender; the cervical glands on the left side engorged; pseudo-membranous concretion on the amygdala of the same side; respiration siffiante, twenty-eight per minute; fit

— Child three years old; pain in the throat Mauve ; diete.

The patient appeared to have been much weakened by the application of the leeches. The two first portions of the emetic draught were given, with an interval of a few hours; these produced some vomiting, and towards evening the child had several accesses of suffocation; the pulse rose to 160.

30. The child's state seems a little improved, she answers the questions addressed to her, asks for something to cat, and says she feels no pain anywhere. The timbre of the voice is still strong, and the respiration more sonorous than yesterday; cough croupy; pulse 120; respiration 30; tongue moist; the child has not been to stool for the last two days. Purgative lavement; four leeches to the neck; emetics; sinapisms to the lower extremities; milk. During the day the child was seized, from time to time, with fits of suffocation, which on the 31st were repeated almost without interruption, from five o'clock in the morning to nine o'clock, when the child died.

Body examined twenty-six hours after death.

General appearance of fat; skin pale; no cadaveric rigidity; injection of the vessels on the sarface of the brain; gray substance natural; white substance somewhat injected; ventricles contain no fluid; the amygdalæ, the pharynx, and the epiglottis, do not present any appearance of a pseudomembranous exudation, nor is the mucous membrane lining those parts of a colour remarkably red. The ventricles of the larynx are filled with a muco-purulent fluid, and below them we find the commencement of a membranous concretion, which extends as far down as the bifurcation of the bronchi; it is about half a line thick; the subjacent mucous membrane is red and thickened; the bronchi contain some purulent mucosities, but do not present any trace of false membrane. The mucous membrane of the stomach and intestinal canal is free from all injection or membranous concretion. However, several of the glandulæ solitariæ are developed in a very remarkable degree, without being injected. Nothing particular in the other viscera.

The symptoms by which this case was characterized were very clearly marked and evident-viz. alteration of the voice, croupal cough, respiration sifflant, false membranes

-Child three years old; pain in the throat after exposure to cold; then cough; hoarseness; dyspucca; sonorous respiration; access of suffication. Death ; redness of the lower part of the larynx, trachea, and bronchi; no false membrane.

Garope Adele, three years of age, a child remarkably fat and well-looking; never had any previous illness, except a mild small-pox in her infancy; had been three days ill when she was brought to the hospital on the 10th of August last. According to the account given by the mother, it would appear that this young child, after having amused herself all day on the 8th on the banks of the river, was seized with hoarseness and cough in the evening on returning home. These symptoms persisted the following day; the appetite seemed then diminished, but on the night of the 9th the infant was seized with fits of suffocation, which made the parent believe she would suffocate every moment. The fits did not continue the next morning, but as the cough, hoarseness of voice, and dyspacea, increased, the patient was brought to M. TROUSSEAU, who declared that she was affected with croup, and immediately sent her to the Hopital des Enfans Malades, with a written invitation to the person on duty to practise as soon as possible the operation of tracheotomy; he also obligingly sent a box of instruments, lest the interne might not be furnished with everything necessary for the operation.

Immediately after the child's arrival at the hospital, the back of the mouth and throat were examined, and nothing was observed except some reduces and tumefaction of the amygdalæ. The hoarseness of the voice and cough showed clearly enough that the inflammation had extended to the air-passages; but there was, at the same time, every reason to believe that the inflammation of the larynx and trachea was of the same nature as that observed in the throat; ten leeches were accordingly applied on the sides of the larynx. A simple lavement given, and mustard poultices applied to the lower extremities. The child slept very profoundly during a great part of this night.

August 11. We saw the child to-day for the first time; the face was moderately coloured; the position of the child in bed varied; the intelligence was perfect; she spoke to her parents who visited her, and intreated on the amygdala, and also an expectoration to be taken home. The voice and cough of organized membranes from the trachea. The greater part of these symptoms were absent in the following case, which was mistaken for croup:—

R. Tartar. Antim. et Potast. gr. i; Ipecacuan. 358 in four parts; mustard poultices to legs. Diete.

Momentary calm after the vomiting. In the evening a few fits of dry hoarse coughing, and dyspuces.

12. Face is more coloured; the child affects the upright posture; the inspiration continues sonorous, and is heard at a good distance from the child; the voice is hourse, but does not resemble the voice of croup; the cough at times resembles the barking of a small dog; when asked where she suffers, the patient sometimes says in the neck, sometimes in the belly; there is no appearance of false membrane in the back of the throat; the redness of the palate and amvgdalæ are much diminished.

Sulphur, sublimed and washed, 9j; Sugar Si; in six doses. Same emetic as yesterday, to inspire the vapour of sulphuric ether.

This day was passed quietly, but towards evening agitation and dyspacea.

13. The cough, voice, and respiration, present the same characters as during the former days; the anxiety of the patient is somewhat increased; the sulphur and emetic powder were continued, and a large blister was applied to the auterior and superior surface of the thorax; the neck was rubbed with an ammoniacal lotion; during the day abundant diarrhea.

14. At the moment of the visit the patient was in a profound sleep; on awaking she made some efforts at coughing; the cough is more moist than yesterday, and is followed by some expectoration of a matter produced in the exophagus. We observe some little anxiety, some grinding of the teeth, but nothing announces an approaching termination of the disease. The stools are extremely frequent, and the matter passed is clear, like water. The abdomen is painful to pressure; nothing remarkable took place in the course of the day or night, but at seven o'clock in the morning the child was suddenly seized with a fit of suffocation, which carried her off before anything could be done for her relief.

Body examined twenty-four hours after death.

Exterior Habit. - Considerable embonpolat; purplish tint of posterior part of point; purposes that of posterior part of trunk, and of the upper part of chest and neck. The dissection was commenced by dividing the lower to the cavity of the mouth was then with care, and no alteration down with care, and ano alteration down with care, and any alteration divides a mygdale true as large as a libert; they do not injection either

not count it, from the restlessness of the externally or internally, the volum palatically, the volum palatically; pharynx of violet colour; the mucous membrane of the epiglottis and superior part of the larynx are pale and not thickened. We do not observe any trace of false membrane or ulceration. The inferior moiety of the largnx and the traches are red; their lining membrane thickened; the same lesion is found in the brouchial tubes of large caliber, which, moreover, contain The left lung some purulent mucosities. adheres at the summit to the pleura costalis for the extent of about a twenty-sous piece, and at the level of this adhesion the pulmonary tissue contains a cretaceous tubercle of the size of a pea; the remainder of the superior lobe is soft and crepitant; the inferior lobe is slightly engoue; right lung healthy; heart and pericardium free from alteration.

> Abdomen — The mucous membrane of the stomach, of a white rosy tint, presents everywhere a good consistence; the small intestines show here and there some patches of injection, and contain a single lumbricus; in the colon, deep red injection, disposed in striae very closely applied to each other, with ramollissement of the mucous membrane. Nothing worthy of notice in the other viscera.

From this latter fact, to which we might add several other analogous ones, we think ourselves justified in concluding .-

1st. That the diagnosis of croup occasionally presents many difficulties at the bedside of the patient.

2nd. That we ought not to decide on performing the operation of tracheotomy without a full and careful examination of all the symptoms; for this operation is, to say the least, useless in cases where no false membrane exists.

3rd. That simple inflammation of the trachea and larynx may give rise to fits of suffocation, which resemble closely enough those observed in the pseudo-membranous laryngitis or true croup.

We may observe, in conclusion, that in the case just reported, the error of diagnosis was not without prejudice to the patient; for if the physician, instead of giving repeated emetics, which perhaps gave rise to the inflammatory condition of the colon observed after death, had repeated the sanguineous emissions, under whose influence the inflammation of the throat was dissipated, he might also have been fortunate enough to subdue the analogous inflammation of the air-tubes.

MENINGITIS.

Inflammation of the membranes of the brain is a disease much more common at the Children's Hospital than at any of those consecrated to the reception of adults. This affection, considered under the double relation of its march and anatomical character, presents itself in infancy under two forms that are sufficiently distinct. In the first, the inflammation of the cerebral membranes is, in most cases, primitive and acute; is developed under the influence of appreciable causes (such as blows on the head &c.); passes rapidly through its different stages; and, when death supervenes, leaves, as pathological characters, serous, sero-purulent, or sero-albuminous effusions in the piamater, ventricles, or (much more rurely) in the grand cavity of the arachnoid.

In the second, which is so much more frequent at the French Hospital for Children, that it may be regarded as the type of the disease, the affection commences under a chronic form, and does not become acute until a period more or less near the fatal termination; but when the acute stage commences, both forms exhibit symptoms so analogous as not to be distinguished by any means that we as yet possess. This form attacks principally scrofulous patients, and presents for anatomical characters, the existence of whitish or yellow-white, tuhercular granulations, varying in size from a millet-seed to that of a rape-seed. These granulations are always found in the piamater, where they are sometimes disseminated, sometimes conglomerated, so as to form spots of more or less magnitude, which compress the cerebral substance, and are frequently united with it in a very close manner.

We would denominate the first form, simple acute meningitis, and would consecrate to the latter a new term (which sufficiently designates its most essential character), tubercular meningitis, or, in popular language, scrofulous hydrocephalus.

The two following cases offer examples of the first of these forms. In a succeeding Number we shall give examples of the second, or tubercular disease :-

CASE 1. - ACUTE MININGITIS OF THE ASE 1.— Acord Ministry of the Convexity.— Patient oyed six years; Leadache; general malaise; delirium; after to the consultions; loss of speech; stupor; coma; local blood-letting; blister to the low grains from time to disast patients.

neck. Death on the 16th day of the disease; opacity and thickening of the arachnoid on the convexity of the brain; serous infiltration of the pia-mater, sufficiently abundant to distend the convolutions.

Adelaide Baldy, six years of age, of a feeble constitution, after having passed the whole of the 7th of June exposed to the rays of a burning sun, returned home K. the evening with headache, and pains in the limbs, which persisted on the 8th and 9th. During the night she was unable to sleep, was agitated, and had some delirium. On the 10th some convulsive movements appeared, with trismus, strabismus, and grinding of the teeth. The convulsive symptoms ceased after the expiration of a few hours, and returned again two days afterwards. From this time up to the 17th, the day of her reception into the hospital, loss of speech, stupor, constipation; no bilious vomiting; the patient merely threw up some spoonfuls of tisan. On the 9th, some leeches were applied to the epigastrium; and on the 12th, a blister between the shoulders: the child had also some refrigerating draughts, and simple enemata, and sinapisms had been placed daily on the lower extremities.

June 17th (10th day of the disease). The child presented the following symptoms:-Decubitus dorsal; no renversement of the head backwards; face full; eyelids half open, pupils moderately dilated and moveable; no strabismus; sight preserved. The patient is in a state of stupor, and does not answer any question put to her; shows her tongue when bid, and then falls again into a state of stupor; sensibility of the skin is dulled, but equal on both sides of the body; automatic movements of the left arm, which the patient carries constantly to the nose; the other members are numbed; grinding of the teeth from time to time; the tongue is moist, and covered with a grayish coat; deglutition easy; no vomiting; abdomen indolent; no stool for the last twenty-four hours; pulse 108; respiration 30.

Emulcent decoct .; eight leeches, two to each temple, and two behind each ear; sinapisms to the feet; frictions with acetic ether on the limbs.

During the day constant stupor; the patient does not speak a single word; passes her urine involuntarily.

18. The stupor is less marked; the child answers in monosyllables to some of the questions put to her; makes an effort to show her tongue, but is unable; no convulsive movement; no paralysis; pulse 120; inspiration 36; dry cough from time to time. 4

Continue remedies, without the leeches.

out her tongue, which is dry, and presents | lung and the pleura costalis; the lung is some aphthæ on the surface; some diarrhæa has set in, and the abdomen is painful to pressure; pulse still 120; face very dull. To day the appearance of the patient, and the symptoms which she presents, are very much those of a child labouring under typhus fever.

Frictions with Camphor Oil on abdomen-on the limbs with Acetic Ether; tempoonful of Sulphuric Ether internally.

vulsive movements of the face; no acute cries (called hydreneephalic in France); no delirium; the child sighs from time to Case 2.—Acute Meningitis of the Base time; pulse 116. Blisters to the lower extremities.

23. At eight o'clock, general convulsions; at nine o'clock, permanent contraction of the right arm, which is demiflexed; carpology in the left wrist; inferior extremities in a state of relaxation; mouth deviated to the left side; pupils dilated and oscillant; strabismus; trismus; two involuntary dejections since the visit; pulse 130; respiration 30.

Three Leeches behind each car; Blister to the neck.

After the application of the leeches, general convulsions set in; the trismus was so complete, that a single spoonful of liquid could not be introduced into the mouth. Death at six o'clock p.m.

Body examined thirty-six hours after death.

Skull well formed; dura-mater healthy; opacity and milky colour of the arachnoid which lines the convex surface of the hemispheres; under this membrane we find a quantity of troubled serum, sufficiently abundant to form a layer, some lines in thickness, between the membranes and cerebral substance; the quantity of this scrosity was so great as to distend the anfractuosities, and even separate the convolutions from one another. The arachnoid, which is thickened, may be detached in layers from one to two inches long, and the pia-mater is not adherent to the cerebral substance; in the parts in contact with the liquid the substance is pale, and seems to have undergone a kind of maceration. The cortical substance is pale and not firm; the fluid effused under the membranes is more abundant on the left side than on the right, and posteriorly more than anteriorly. The membranes lining the base of the skull do not present any alteration. The ventricles contain only a spoonful of clear serum; the central portions of the train preserve their normal colourant conflictance. The rest of the brain and completion is healthy.

a rosy colour externally, soft and crepita ' does not contain a single tubercle. Bron chial glands, heart, and pericardium, healthy.

Abdomer .. - The stomach presents some small red bands parallel to its great curve; the rest of the mucous membrane is pale. The portion which lines the great curvature is in contact with a fluid resembling wine-lees in colour, of an acid smell, and is softened; intestinal mucous membrane is stupor has become more deep. Some con- ly amore and solitarize are scarcepale, and of the natural consistence. The healthy.

> OF THE BRAIN, WITH EFFUSIONINTO THE VENTRICLES, AND SOFTENING OF THE CENTRAL PARTS.

(The " Acute Hydrocaphalus" of Abercrombie.]

Male, three years. After some days of malaise, intense headache, with bilious comiting for four days; convulsive movements of the muscles of the face; sommolence; sighing respiration; coma; renversement of the head backwards. Death the fifteenth day; seru-purulent infiltration of the pig-moter at the base of the brain, effusion into the ventricles; softening of the central parts.

Auguste Colson, three years of age, having the skull and thorax malformed, exhibited for a few days malaise, dulness, and a disinclination for movement; when on the 29th of August last, without any known cause, he was seized with very severe headache and bilious vomitings. These symptoms persisted for four days. On the 31st, some convulsive motion of the muscles of the face and limbs; obstinate constipation for the first three days. No active treatment pursued.

On being carried to the hospital, the 1st of September 1835, we observed the following symptoms at the visit of the 2nd.

Child is in a demi-somnolent state, interrupted by low cries now and then; face alternately red and pale; eyelids closed; eyeballs prominent, sensible to the light; pupils seem moderately dilated; senses of seeing and hearing intact; does not answer when spoken to; sensibility of the skin is greatly exaggerated; the least touch makes the child cry out; equally so at both sides of the body; no stiffness or paralysis of the limbs; the left eyelid contracts strongly when we endeavour to examine the eyeball; the other opens with the greatest case, as if it were paralysed; pulse slow and intermittent, 64; respiration unequal, mixed with sighs, 36; skin moderately warm; tongue natural; one copious vomiting this morning; constipation persists; abdomen supple, is very sensitive to the touch; emission of urine involuntary.

M. Guzzazyr discreationed a menine

a large blister to the head, a laxative ene- it up, it drops down deadly on the side; the

ma, and an emulcent drink.

3. The blister has acted with sufficient energy; the pulse continues slow and intermittent, 56; the respiration is somewhat more accelerated than yesterday, 40; the cerebral symptoms noted yesterday persist, and we now notice that the left side of the face is much less developed than the right, as if from retraction of its muscles; same condition of muscles of eyelids as yesterday; no strabismus; constipation persists in spite of the enema. The child appears less cross than yesterday.

Oxymel: Mustard Foot-bath; Puryative Enema; keep open the Blister.

4. The face colours brightly whenever the child is excited; the drowsy state persists; machonnement now visible; no convulsion or paralysis of the limbs; same state of evelids as before; and we now find that the right cheek is less sensible than the left, and that the right pupil is a little more dilated than the left; no acute cries; pulse is less irregular than yesterday, 72; respiration unequal, 54; the abdomen still very sensible to pressure; the right arm is less sensible than the left; legs equally so. Three stools produced by the enema; the skin is now very warm, almost burning hot. the evening an exacerbation; pulse 116; skin much more warm than in the morning of the 3rd.

5. The child is not much assoupi, as during the former days; does not evince the same sensibility when touched; abdomen not so tender as before; he sighs from time to time; skin not so warm as yesterday; pulse 112, very irregular; respiration very unequal, 32 to 36; one stool; same alternations of flushing and paleness; general symptoms the same as yesterday. In evening at four o'clock, a slight exacerbation, which lasted till five o'clock. Continue

remedies.

6. To-day the child is able to sit up in bed without support, and there was but little stupor during the night; the left cheek is now very much flushed, the other one pale; the abdomen is still slightly tender; two liquid yellow stools; pulse varies from 112 to 124, is regular; respiration quick, regular, 52; skin warm; pupils moderately dilated; we still observe the peculiar sighing from time to time.

Oxymel; simple Enema; Foot-bath; suppuration to be kept up. Diet.

7. Child lies quiet in bed; eyelids wide open; very little stupor; same alternate flushing of the left cheek only; same contraction of left, and complete relaxation of right eyelid; skin waim; puted than the no cries left when we pinch them with the nails; remember right eyelid; skin warm; pulse regular,

with of the base of the brain, and prescribed | right arm reems relaxed, for when we raise angle of the mouth seems a little prolonged towards the left side; no convulsive motions

> Oxymel; Calomel, gr. iv; Purgative Enema if required. Diet.

9. One small stool after the enema; pulse regular, 104; respiration from 34 to 36; thirst; but little change since yesterday; skin warm; not much stupor; same state of eyelids as before; no vomiting since the first one; no convulsive movement; no rigidity or relaxation of the limbs.

Oxymel: Calomel gr. vi; Purgative Enema if necessary.

Immediately beneath the above notes (which are here much curtailed), we find the following observations in our portefeville:--

" If we had seen this child to-day for the " first time, and had not known the history " of the case, or observed the symptoms " and their march very closely, we should " have found it extremely difficult to form a " diagnosis. The stupor or sleepiness peculiar to meningitis was now barely perceptible; the pulse and respiration had now become regular, and very nearly na-" tural; they were not slow; in fact there was " no symptom of cerebral disease to be ob-" served, except the constipation, the dif-" ference, so well marked, of contractility " between the two cyclids, and the difference " in bulk between the two sides of the face, " which latter symptom, besides, might very " easily have escaped notice, as it was not striking. We confess the appearance and state of the child to-day have much staggered us; however, from a consideration of what has preceded, we find ourselves " compelled to conclude, that he ought to " have meningitis, and that in consequence " the case will be fatal."

9. No cries during the night; no vomiting; no stool. When we came into the ward we found the child sitting up in the bed, without any support, and presenting a sufficiently natural appearance. The face is pale; no flushing now observed; no convulsive motion of face or eyes; some grinding of the teeth; skin cool; pulse small, sharp, regular, and equal, 134; the right arm has to-day recovered its motion,—on the contrary it feels a little stiff; child still sighs occasionally; respiration quite regular, 32; thirst; deglutition is quite easy; abdomen tender to pressure; no phenone non of motility, or change in sensibility

Oxymel ; Calemel gr. wit; Purgative Enoma. 10. To-day is

days; two steeles much so as a no cries whose

warm; pulse regular, 120; respiration quiet; much more injected than that of the right and regular, 38; some contractility of left We do not observe any granulations in the orbicularis muscle, which prevents us from examining the state of the pupil; right one, though now slightly contractile, is easily opened; no contraction or relaxation of extremities, or rigidity of trunk; abdomen neither ballonne nor retracted, tender.

Oxymel; Calomel gr. ix; a little rice. three o'clock p.m. a slight exacerbation.

11. Stupor; a little sighing from time to time; face pale; no change in its colour; both orbicular muscles to-day contract most powerfully when we attempt to open the eyelid; pupils very slightly dilated; skin cool; pulse very small, 130 to 140; respiration very irregular, 22; right arm now cannot be flexed easily, and left arm cannot be extended; three stools; abdomen tender. Remedies as before.

12. During the day, yesterday, the child became quite stiff at different times; during the day also he frequently carried his band to the head, but uttered no complaint; now lies quietly on back; lids open; eyes rolling upwards; upper extremities stiff, as also the right lower one; pupils dilated, immoveable; conjunctivæ injected; pulse very small, 140; respiration 36; face very pale; skin cool.

Death at five o'clock a.m. on the 13th.

Body examined on the 14th at nine o'clock.

The spinal marrow, which was the part first examined, presents a natural appearance. Nothing observable except some injection of the membranes at the inferior nart.

Brain examined from below upwards. The membranes covering the right side of base not more injected than natural; on the left side the whole blunt end of the middle lobe, immediately behind the fissure of Sylvius, presents, for the space of two to three inches long by a half broad, a straw-coloured infiltration under the arachnoid; here the membranes are adherent and thickened, but the membranes themselves here, or in the surrounding parts, do not exhibit the red vascular appearance of recent inflammation.

(In the upper surface of the brain the difference between the appearance of the two hemispheres was most remarkable; on the right side the injection of the vessels of the pia-mater was moderate, perhaps a little more than natural; on the left side the whole surface of the hemisphere is covered with fine vessels, and between the convolutions the trunks ascending from the base of

pia-mater.

The ventricles are considerably developed posteriorly, and contain about three ounces of clear serum. The inferior surface of the corpus callosum, the fornix, septum lucidum, &c., are very much softened, and reduced to a pulp; the floor of the ventricles is of a pinkish hue. Cerebellum and medulla oblongata healthy.

Lungs healthy-merely some tubercular matter in the bronchial glands.

Abdomen not examined.

In this last case a blister to the head was the only treatment employed; but we are not to conclude that M. Guersent has recourse to no other means. We have repeatedly seen him try bleeding, especially local purgatives, and a long-continued stream of cold water on the head (for eight days without intermission) : but as all those cases in which blood-letting was employed terminated fatally, he wished to observe the march of this affection under the influence of other remedies.

SALIVARY CONCRETION.

To the Editor of THE LANCET.

Sir,-Considering that the enclosed case of salivary concretion is such a one as is very rarely met with, I forward it for insertion in your widely-circulated periodical. and subscribe myself, Sir, yours,
T. C. Sympson, Surg.

Lincoln, Sept. 24, 1835.

Mrs. Wise, of Branston, called upon me about two years since to have a tooth extracted, which she described as being a very ugly one. Upon examination I found the two molares of the superior maxillary hone completely hidden in a growth of apparently bony substance, which projected so much externally as to disfigure the face, and possessed great firmness of attachment to the jaw, on touching it, with hardness, and the cnamelled appearance which is frequently noticed in exostosis of the jaw. The projection being outward, I told her not to alarm herself, but to call upon me every three or four months, which she did until the last three months. When she last called, it was with a very joyful countenance, to inform the brain are exotaively gorged with dark me that the whole substance, to moral the brain are exotaively gorged with dark me that the whole substance had fallen of blood; here and the whole weight previous, at support time. The rosy spots under the substance is from concretion is now in my possession. It is divided into one large and two very small places, the whole weighing 115 grains. The

is three-fourths of an inch; its length is one inch and a quarter; it is of a yellowishwhite colour, and has a rather conical appearance, the apex, when attached to the teeth, being directly opposite Steno's duct.

The only conjecture that I can form respecting its formation is, that, as the saliva had passed from the duct, an abnormal deposition of tartar formed an incrustation, thoray." Hydrothorax, in the true meaning which gradually (near six years) accumu- of the word, it certainly cannot be denomilated until it had attained the extraordinary size I have above detailed.

It is worthy of notice, that there has never been the slightest accumulation of tartar on the left side, nor from the submaxillary

glands.

CASE IN WHICH MR. WORTHINGTON PERFORMED

FARACENTESIS THORACIS.

To the Editor of THE LANCET.

Sin,-Will you allow me to make one or two observations on the case of paracentesis thoracis, which is published at page 801 of THE LANCET of September the 19th

It appears to me that Mr. Worthington has fallen into error in describing the case which he treated so judiciously as one of hydrothorax, and that he errs still more when reasoning upon it. He adduces it as an instance of primary hydrothorax, re-pudiating the opinion of Mr. Lawrence as to the rarity of such an affection. I differ from Mr. Worthington in his diagnosis, for the following reasons.

First, Mr. W. states that "the fluctuation of the contained fluid could be distinctly heard by the patient and bystanders, on succussion. It is a well-known fact that in order to render the fluctuation of a fluid in the pleural cavities perceptible to the ear, the presence of air is absolutely necessary in addition to the fluid, and that the only disease in which this phenomenon is observed is that of pneumo-thorax, of which if is pathognomonic.

Secondly. Mr. W. describes the fluid which he evacuated as being "sero-purnlent." Now, I apprehend that in essential hydrothorax the fluid must be of a serous nature. If not, whence the purulent tend-ency? It must arise as a product of inflammatory action. If in the lung or the pleura, it cannot be termed "primary," "essential," or "idiopathic hydrotherax." In chronic pleurisy we frequently have effusion into the pleura of sero-purulent fluid, but we should hardly call such an affection "primary hydrothorax."

Thirdly. In six thousand cases which came under the observation of Andral, per- Jones that afficiat us

projection of the larger piece from the base haps the first pathologist in the world, there were only five in which the hydrothorax was not found to depend upon organic disease. (Vide Clinique Medicale.)

From these facts, and from others mentioned in the history and symptoms of the case, I think Mr. Worthington would have been more correct had he denominated the case, "empyema complicated with pneumonated, and, consequently, the deductions drawn from it against the opinions of Lawrence. Audral, Laennec, in fact, of all modern pathologists, are incorrect.

In empyema the operation has frequently been performed, and occasionally with success; and I consider that Mr. Worthington's treatment of the case reflects great credit on his judgment and skill. The observations which I have ventured to offer I am sure he will receive in the spirit in which they have been made, the elucidation of truth being my only object. I am, Sir, your most obedient servant,

CHARLES ROBERT BREE. Stowmarket, September 23, 1835.

ANCIENT AND MODERN NEGROES.

To the Editor of THE LANCET.

Sir,-From a learned work, printed a short time since, entitled "Anacalypsis," and written by the late Godirey Higgens, I have made some extracts, which relate to a portion of the early history of our race, and, as I conceive, bear reference to a part of the inhabitants still existing on our globe.

This communication, although not strictly of a medical nature, yet may be deemed replete with interest, as connected with those extensive views which our science naturally embraces. Truly appertaining to the natural history of man, upon which subject your columns at various periods are pregnant with information, viewing it in its physical and moral aspects, I trust it will be thought that this article has not intruded into a quarter which might have been more lealtimately and more profitably occupied. May I therefore request its insertion in your widely-diffused periodical, in the hope that some of the scientific readers of THE LAN-CET, whose investigations have been directed towards such matters, may be enabled to adduce some arguments, or disclose some facts, tending to elucidate the apparent inconsistency, or altogether to remove the presumed resemblance?

ossessed the dominion of Asia, and held the lips, particularly the under lip, are remarkest of empire at Sidon. These must have ally thick?
Leen the people called by M. Maurice
Cushites, or 'Cuthites,' described in clarence in his journal; and Maurice, in the Jenesis; and the opinion that they were placks, is corroborated by the translators of he Pentateuch, called 'the Seventy,' contantly rendering the word 'Cush' by Ethiopia.

- 2. "The religion of Buddha, of India, is ery ancient, as is well known. In the most incient temples scattered throughout Asia, where his worship is yet continued, he is ound black as jet, with the flat face, thick ips, and curly hair of the negro. Several statues of him may be met with in the museum of the East India Company. There ire two exemplars, brooding on the face of he deep, upon a coiled serpent. To what inc are we to allot this negro? He will be proved to have been prior to the god called 'Cristna." He must have been prior to, a contemporaneous with, the black emaire, supposed by Sir W. Jones to have lourished at Sidon. The religion of this tegro god is found, by the ruins of his temdes and other circumstances, to have been pread over an innuense extent of country, ven to the remotest parts of Britain.
- 3. " Euschius stares, that the Ethiopians ettled in Egypt in the time of Amenophis; hey came from the river Indus, and planted hemselves south of Egypt.
- 4. " Philostratus says, that the gymnosohists of Ethiopia, who settled near the ources of the Nile, descended from the Bramins of India, having been driven thence or the murder of their king.

5. " Enstasins also states, that the Ethipians came from India.

- 6. " The superior antiquity of India is hown by Baily, and many other learned
- 7. " The Ethiopians are stated by Herolotus to have come from the Indus. Memion, who was sent to the siege of Troy, and vas killed by Achilles, Virgil describes as mying been a black (Lineid, lib. i), as does dso Pindar (Olymp. Od. ii; ride Diss. of bishop Hewet, ch. xiii, p. 185). That Pindar and Virgil were right, the features of the mst of Memnon in the British Museum rove, for they are evidently those of the legro.
- 8. "Mr. Wilsford, in his treatise on Egypt and the Nile, in the 'Asiatic Researches, uforms us that many very ancient statues of he god Buddha, in India, have crisp early air, with flat noses and thick lips. Nor can t reasonably be doubted that a race of neroes formerly had power and pre eminence n India. This is confirmed by M. Maurice,

nord and full is the and the in no respect do their intellectual endow-

first vol. of his Indian Antiquities, states that the figures in the caves of India, are absolutely the same as those in Egypt described by Bruce, Niebuhr, &c.

10. "Justin states that the Phœnicians being obliged to leave their native country in the East, they settled first near the Persian Gulf, and Maurice says, 'We find an extensive district, named Palestine, to the east of the Euphrates and Tigris. The word Palestine seems derived from Pallisthan, the seat of the Pallis or Shepherds." Palli in India means Shepherd. This, coupled with the Shepherd Kings of Egypt, confirms Sir W. Jones's opinion in a striking manner, respecting a black race having reigned at Sidon.

11." Sir W. Jones says, 'the Mountaineers of Bengal and Bahar can hardly be distinguished in some of their features, partienlarly in their lips and noses, from the modern Abyssinians, whom the Arabs call the children of Cush.

12. "In my essay on the Celtic Druids, I have observed that a great nation called 'Celta,' of whom the Druids were the priests, spread themselves over almost the whole earth, and are to be traced in their rade gigantic monuments from India to the extremity of Britain. What these can have been but the early individuals of the black nation, of whom we have been treating, I know not, and in this opinion I am not singular. The learned Maurice says 'Cuthites, i. e., Celts, built the great temples in India and Britain, and excavated the caves of the former.' And the learned mathematician, Renben Burrow, has no hesitation in pronouncing Stonehenge to be a temple of the black curly-headed Buddha."-p. 52.

If it can be admitted with the learned author from whom I have quoted, that the most ancient race of which we have any record, either in the pages of history, or in the gigantic cavern sculptures of the east, or in traditionary legends, were black, and in physical conformation and visible aspect similar to the race of negroes which at present exists, by what means can we account for the degraded condition of the latter? How reconcile the vast intellectual distinction between them?

I think it will be readily allowed that the negro nations, so far as we are acquainted with them, are fitted, neither by physical capabilities nor by moral attributes, to become the founders or rulers of great kingdoms. We perceive that year after year, vho says 'the figures; the Hindoo caverns and century after century, to them brings are of a very different from the no change. We observe that their habits entrace of the requirements and their customs remain unaltered; that ments appear to advance with the experi-lturies in this isolated condition, they conremained stationary from the period of their first introduction to civilized man. How, then, were their presumed predecessors enabled to assume so commanding a situation. to attain to so proud an elevation among the empires of the world? By what means did they arrive at such eminence in scientific knowledge and mechanical ingennity? In what manner did they extend their fame and influence into almost every region, however remote?

A query naturally suggests itself, Can the existing African negroes be the descendants of this widely-spread, intelligent, and refined race? Can the being so low in the scale of intellect as the negro is represented to us to be, be connected by consanguinity with this exalted people? If it be answered in the negative, where-to what countryshall we look for their continuance? Where are their descendants in skill, knowledge, and refinements, possessing the same external physical conformation?

Statius somewhere mentions that Juniter was a black deity. We have seen that Buddha was black. The Corinthians worshipped a black Venus. Osiris was described as black. The Virgin Mary of the Romish church was black, and that Christ was supposed to be black, is apparent by a reference to numerous images in most of the continental cathedrals. Here then we have strong presumptive evidence of the superior attributes and perfections of an antecedent dark-coloured race.

If the query which I have above suggested be answered in the affirmative, to what chain of causes are we to effix the great debasement of the present existing negro? To what source are we to turn for satisfactory reasons for such a manifest and striking difference in the intellectual endowments and sagacious actions of the same

people of two different periods?

Without presuming to offer an opinion, but merely to afford a hint for investigation, I would ask whether the solution of the difficulty can be advanced by the following attempt at explanation? A succession of conquests, with other political and social causes combined, forced these black deseendants of the Palli, or Indic-Tgyptian shepherd kings, and the tribes belonging to them, to emigrate progressively further into the interior of the vast continent of Africa, where at length they find a secure and unmolested haven from their toils and sufferings, unworthy of the ambition and uninviting to the cupidity of their neighbours. The intense heat of the climate, the sterility of the soil, and the unimprovable appearance of the whole face of the country, would be sufficient to ward off all intruders, whether hostile or commercial. Remaining for osn- cough

ence of years, and the most that can be tinued a distinct and unmixed race. The stated in their favour is this, that they have powerful stimuli of foreign war, of commercial intercourse, of social improvement, being absent, their minds became contracted and weak. Succeeding generations adding to the stolidity of their progenitors, became still more depressed in mental energies, and after the lapse of many ages, they reached the degraded and melancholy condition which they now exhibit. Finally, having little or no intercourse with the rest of mankind, and a very limited range for the exercise of their intellectual and moral faculties, the gradual disuse of those powers which were originally implanted in them, may have created that result on their cranial configuration and intellectual manifestations, which, under somewhat analogous circumstances, phrenologists have frequently observed. I remain, Sir, your ever-instructed reader,

T. C. Guerin, Surgeon. Islington, Sept. 19th, 1535.

INFLAMMATION OF THE LUNG

11

NEW-BORN CHILDREN.

In a late Number of the Berlin Gazette (Medic. Zeitung). July 29, 1835, we find a notice of a disease affecting children innicdiately after birth, which the author, Dr. KLUGE, is inclined to range under inflammation.

The disease has been observed from time to time in the Charity Haspital of Berlin, particularly in April 1832, when, several fatal cases occurring, it gave rise to a more careful examination of its symptoms and nature. The following abridged case will give an idea of its march :-

Louise Biclocke, 29 years of age, healthy and well formed, was delivered on the 7th of May of a healthy child, weighing seven and three quarters pounds; the child pre-sented no trace of disease, but seemed strong and lively, and immediately took the breast; about twenty-four hours after birth, the child began to exhibit for the first time, a pale colour of the skin, restlessness, and agitation, uttering short, broken, piercing cries. After the lapse of about half an hour, the skin assumed a dull-gray colour, which on the hands, nose, and about the mouth, passed into a gray-be. Symptoms of disy organs now immeorder in the regi diately see reptly became weaker,

and during which the child became very ment in the respiratory organs by several rigid. The temperature of the skin was hours; in some cases even by twenty-four diminished; the pulse frequent. A single hours. leech was applied immediately to the chest, and one grain of Calomel with two grains of Carh. Magnes. was given internally. A slight noticed as a true inflammation of the lung, remission now occurred for about half an and not as a consequence of mere congeshour, when the respiration again became tion. 1st. From the examination of the face deep blue, the breath cool, the extremities cold, and the infant died in a state of suffocation, six hours after the first appear. in its first stage), analogous to the product ance of the symptoms.

The outopsy was conducted by Dr. Fao-

RIEF, Prosector at La Charite.

The upper part of the body, down to the edges of the ribs, was of a deep-blue colour; the veins on the upper surface of the brain and sinuses were much engorged; the brain arachnoid, while the changes in the lung itself much injected, and some fluid blood was found in the base of the skull after the degree of congestion. removal of its contents. In the abdomen nothing abnormal; the veins not much dis-tended with blood. In the neck the nerves healthy, the arteries empty; but the veins SPONTANEOUS CURE OF A TRAUexcessively distended; the jugelar vein had the diameter of a large goose-quill. This excessive fulness of the venous system extended to the subclavian vein, and jugular The membrane of the trachea distended. and broughi was bluish, but not softened; heart normal; the foramen ovale open; in the left side only a small quantity of coagulated blood. The right side and the pulmonary artery gorged with blood; the duetus arteriosus open. The lungs of a bluered colour; at several points of the lung, especially inferiorly, the pleura pulmonalis was separated from the parenchyma, by a troubled brownish fluid. The deep-red portions of the lung swim in water; the darkblue portions, which are solid and not crepitant, sink quickly to the bottom.

The most remarkable symptom by which this affection of the lungs in the new-born children was preceded, consisted in a change in the colour of the skin, which from its natural red tint became pale or ash gray (as in the commencement of cyanosis), and lost its heat. As soon as this colour had been fully established, the pulmonary symptoms set in, but were never accompanied with regular cough. When the characteristic coloration of the skin was noticed sufficiently early, before the development of Ethe pectoral symptoms, the application of one to two lesches, with the internal use of calomel, was in get sufficient to save induced the author to apply six lecches the patient's life; lar period every treatment d

Dr. FRORIEP considers the disease just quicker, the skin of a darker colour, the lungs, which contained a gray-brown troubled serosity (the product of inflammation in gray hepatization.

> 2nd. From the symptoms during life, and particularly from this circumstance, that although the brain was excessively congested, little fluid was found in the cavity of the were much more remarkable under a lesser

MATIC CATARACT.

THE question whether cataract admits of and vena cava superior, while the inferior any cure otherwise than by an operation, cava and its branches were only moverately has long been debated in surgery. Many writers deny the possibility of its being removed by absorption under the influence of external treatment, while one or two French surgeons of the present day (who pass by-the-by for charlatans in the profession) oppose with warmth all idea of operating, and profess to cure cataract in all its stages by simple medical applications. The case now before us, however, seems sufficiently authentic to deserve consideration.

> In the mouth of January 1834, Dr. PAOLO Genson was called in to visit Francesco Brussi, a child five years of age, who had received a stroke from a sharp-pointed knife in the right eye. Sen two hours after the accident. The little patient presented the following symptoms: a portion of the aqueous humour had escaped; the iris was uninjured, and did not prolapse beyond the small wound in the lower part of the cornea; however, the crystalline lens appeared somewhat troubled, and the surgeon was led to conclude that it was injured, particularly as the patient saw very little with the eye, although the pupil and iris were in a normal state. The child did not complain of any pain in the orbit, and though no symptom of inflammation declared itself, the fear of secondary cataract the no unfavourable symptom appearing, the case was less to nature. At this period the

formation of a cataract was very visible. There was a cloudy spot in the eye, and soluble in water, and still less so in alcohol the edges of the wound showed a tendency to unite with the subjacent portion of the iris; an astringent collyria was ordered, to combat the opake spot, which produced an excellent effect, and after three days the child was permitted to amuse himself as usual. The parents were recommended not slightly favour its solution. Strong pulto employ surgical assistance, for the re- phuric acid turns it to a deep brown and moval of the cataract, in too great a hurry. Four months had elaused, when M. Gerson was again called in to see the patient, whose parents entreated him to undertake an operation. On examining the eye he perceived that absorption of the cataract had already commenced; there was a small perforation in the centre of the cloudy body. Extract of belladonna was now rubbed over the eyebrow, and the dilatation of the pupil permitted this fact to be established beyond any doubt. As the pupil gradually dilated, the ultimately completed .-- It File it. Sebezio.

NEW PRINCIPLES IN OPIUM.

Two new principles have been discovered in opium by M. Pelletier, who thus names and describes them in the Journal de Pharmacie for Sentember:-

PARAMORPHINE.-This substance is white, scarcely soluble in water, and very soluble in alcohol and in ether. Even in cold water it has a bitter and styptic taste. By spontaneous evaporation, it crystallizes in necdles, which adhere to the sides of the ves-sel. It is slightly soluble in the acids; the alkalies precipitate it from its solution, and an excess of alkali does not redissolve it, unless the alkaline solution is very concentrated. The solutions in acids never yield erystals; the evaporation only furnishes small yellow plates. It is not volatilized at a high temperature, but it is decomposed in the same manner as the other vegetable alkalies, yielding nitrogen compounds. It differs from morphine in its not being reddened by the action of strong nitric acid, and in its not forming crystallizable salts with the acids; nor is it changed to a blue colour by the salts of iron. It resembles codeine by its solubility in alcohol and in ether, and by its alkalinity; but it differs from it in not forming large crystals, nor forming crystallizable salts, and in its being precipitated from its solutions in acids by ammonia. It has no analogy with narceine or nicotrine. The only substance which paranicotrine. The only substance which para-morphine nearly resembles is narcotine; thigh,"—viz.depression of the corploid cavity however, the difference of the taste, of the fusibility, and of the solubility in alcohol, is sufficient to distinguish the one from the other.

PSEUDO MORPHINE.-It is but Slightly and in ether. Alcohol at 36° R. takes up a little more; solution of ammonia does not sensibly dissolve it; the solutions of potass and soda dissolve it in large quantity, and on saturating the alkalies by an acid, it is precipitated; an excess of acid seems to changes it. Nitric acid acts on it in the same way as on morphia, and produces an intense red colour, and, finally, converts it into oxalic acid. The most remarkable property of this substance is the intense blue colour which it strikes with the persalts of iron, especially the permuriate. This colour disappears when there is an excess of acid, in the same way as morphia does. The affinity of this substance for the oxide of iron is such, that although it resists the solvent power of sulphuric acid, and is disabsorption was seen to proceed, and was solved only in small quantity by hydrochloric (muriatic, acid, yet the permuriate of iron dissolves a considerable quantity of it. This solution is of a fine blue colour. When beated, it becomes of a dirty green; on adding a little ammenia, there is a slight precipitation, and the liquor takes the colour of Alicant wine, and the organic matter cannot be removed without complete decomposition. These phenomena are nearly the same as those presented by morphia when similarly treated. When submitted to the action of heat, the pseudo morphiae does not volatilize; it does not undergo complete fusion, it is decomposed at the moment it seems to become soft. Distilled in a glass cucurhite, it yields a little oil, and a little water slightly acid, but from which potass disengages ammonia. A large quantity of carbon is condensed when the cucurbite is exposed to the air.

The following is the analysis of the substances compared with morphia, according to M. Liebeg :-

Paramorphine.	Pseudo Morphine,	Morphine.		
Carbon 71.310	52.74	72.340		
Hydrogen 6 280	5.81	6.360		
Nitrogen 4.408	4.08	4.995		
Oxygen 17.992	37.37	16.299		

ANATOMICAL SOCIETY OF PARIS.

Extracts from the Bulletin of the Society. No. 1, September, 1835.

M. CRUVEILHIER announced to the se ciety "a new cause of shortening of the different

M. GURRARD presented an example "of nomenon which he has very frequently met a solitary acephalocyste of the brain." It with. The symptoms go on increasing, and was found in the centre of the middle lobe, and projected both into the lateral ventricle, and at the surface of the brain. It disease by no means so rare as is imagined. was as large as a large hen's egg; weight four ounces one-eighth; the surrounding cerebral substance was perfectly healthy. The patient had been affected with incom-plete paralysis of the limbs on the opposite side. The tongue preserved its natural mobility.

M. Fourner presented a specimen of "old hemorrhage into the cavity of the A sac formed of smooth transparent parietes was found between the two layers of the arachnoid; it contained some serons fluid, and was adherent to cerebral serous membrane, at the level of the small wings of the sphenoid bone. The patient, a man of forty years of age, entered the hospital with delirium, slight deviation of the mouth, and great feebleness of the right hand; he had already experienced similar attacks three times, from which he had completely recovered .- The same member presented a second example of hemorrhage into the arachnoid, but here the disease was more recent. The parietes of the cyst were reddish, and strongly adherent to the parietal serous membrane. The sac contained a bloody liquid. The patient had been affected with complete hemiplegia on the same side as the offusion.

M. VERNOIS presented a section of the facial nerve effected in the aqueduct of Fallopius by an old caries of the bone. The patient had been affected with complete loss of movement in the muscles of the face on the same side, but the sensibility remained intact.

M. CRUVELLHIER presented a new example of "an ulcer of the stomach cica-trized." This case was perfectly analogous to those which have already been exhibited to the Society at different times. M. Cruveilbier had at an early period diagnosticated ulcer of the stomach, and on several occasions he has been able to pronounce with certainty on the existence of this affection. The following are the chief symptoms upon which he insists. The patient has, almost always, vomiting of blood; he recovers, and has a relapse in a short time. The digestion is difficult, the abdomen is the seat of colicky pains; he also passes blood by the rectum, and the region of the comach is affected with a gnawing kind of pain, but we perceive no tumour. A symp-

the patient dies from an abundant hemorrhage. The professor considers this as a

M. BERARD presented the intestinal canal of a female, who, in an access of mania, had cut out two feet of the intestine. This case gave rise to several practical observations of importance. The ileus was furnished with valvulæ conniventes nearly down to the cacum, a circumstance by which the operator was led into an error; for, regarding the wound as having its seat not far from the stomach, he attempted to unite the gut by suture, instead of trying to establish an artificial anus.

M. Berard also noticed a second error into which he was led by following the method proposed by several authors for distinguishing the superior and inferior orifices of the intestine, viz. the greater contraction of the inferior orifice. In the present case, relying on the indication just mentioned, the surgeon had invaginated the inferior into the superior orifice, as was shown by the autopsy; though no ligature had been placed round the vessels of the epiploon, no effusion of blood took place into the cavity of the abdomen. The patient lived for thirtysix hours after the operation, but no trace was found of adhesion between the two layers of the scrous membrane placed in contact according to M. Jobert's method. A discussion took place on the presence of

valvulæ conniventes prolonged so far as the cæcum, in cases where the intestinal canal was remarkably short, as in the present one. A great many members thought that they were merely folds of the mucous membrane thrown up by the contraction of the muscular fibres. M. Rufz said that M. Maniere had seen about twelve cases of peritonitis in which the small intestine was very short, and the valvulæ were prolonged as far as the excum.

The President referred a good deal of these appearances to anatomical varieties; he had seen the small intestine vary from cleven to twenty-one feet; and in one case of peritonitis it only measured seven feet.

M. GARIEI, at the meeting of the 12th of March, read the history of the case of a young man who had fallen from a second floor, and died in a very short time after the accident. Amongst other injuries was found a rupture of the left auricle of the The pericardium contained from beart. five to eight ounces of fluid blood; and the base of the appendix of the left auriton upon which M. Cracelihier lays a good deel of stress is the end of the cutrance of the dental canal posterior of the stress of the

toid muscle, there was no trace of solution of continuity. This latter circumstance is the more worthy of notice, since Boyer has positively denied the possibility of incomplete fracture.

THE LANCET.

London, Saturday, October 3, 1835.

THE present Number of THE LANCET. although it will be dated October the 3rd. will be in the hands of the incdical students of this metropolis on October the 2nd. The 1st of October is generally the first day of the medical session, but it is seldom that the business of the session is actually commenced until the first Monday in October, and until that time arrives it rarely happens, we believe, that the students determine on the respective schools which they will attend; and their just and reasonable irresolution induces them, for a while at least, to withhold the payment of those fees which are so mercilessly extorted from them under the operation of the certificate system. This Number of THE LANCET, therefore, will be placed before them at a time when a few words of advice, relative to their immediate proceedings as students of medicine, may prove satisfactory to their minds, and valuable as to their future prospects.

The students will have already learned, from the regulations which have been issued by the incorporated medical bodies,-the self-dubbed "heads" of the profession,-that an immense number of lectures-NEARLY ONE THOUSAND-must be attended in a given time, and that the practice of some hospital or infirmary must be paid for, even if it be not seen. Now, as the law in its what is denominated "knowledge" when there can be no reason, as the money most of Sur

be laid out, why it should not be disposed of to some advantage. When a young gentleman departs from his native town, after having served an apprenticeship to an intelligent practitioner for the purpose of entering the medical schools of London, it is regarded by his relations and friends s one of the most striking events that can happen during his life; and by parents and guardians it is frequently considered, and with much justice, that the result of the trial which the youthful mind will then undergo, most determine the future conduct and character of the individual. If matters were differently ordained in our profession,- if the accursed monopolies were destroyed,-if the present obnoxious laws were repealed,-students would be left free to visit the metropolis for the purpose of being examined at once, under the scrutiny of a National Faculty of Medicine, or tif they thought proper) to bend to an inclination for acquiring such additional knowledge as our hospitals and schools could afford. The restrictions, however, which are now imposed on their conduct, with respect to the production of the certificates of " recognised" hospitals, schools, and teachers, require that a certain amount of money should be paid as the sign, virtually, that they have been compelled to submit to a double sacrifice,-a pecuniary one in the first instance, and the loss of time as a consequence. Oh! it is a frightful, a barbarous system,-a perfect mockery of the principles which should regulate the measures by which knowledge is to be acquired,-a mockery of the reward which should be afforded to scholastic zeal and industry .-- a fraud hitherto practised successfully on talent,-a bonus willingly presented to the negligent and the ignorant. Nothing but a present most odious state requires that feeling of the most paramount necessity medical students should expend money for could have induced us to urge upon medical students, in many of the proceding numthey visit this metropolis previous to their bers of this Journal the propriety of strictly examination at the College and the Hall, conforming to the college

Although the current of improvement in its maintenance to the monopolies in our medical affairs has been flowing on with considerable activity within the last few years, yet so uncertain are human events, that it has been impossible to predict with any degree of certainty when the Augean stable of medical abuses will be wholly cleansed. We again advise students, therefore, to comp'y with the regulations which have been issued by the different medical boards, because we are desirous that their introduction into the profession, as legallyagalified individuals, should not be retarded by the extortions which are practised on their pockets. A few days observation will convince them of the truth of all that has been stated in THE LANCET relative to the iniquity of the ticket and certificate system. Still, as the "tickets" must be purchased in order to obtain the "certificates," and as the " certificates" must be presented to the Examiners before the licenses and diplomas can be acquired, the student is called upon, by the obligations which he owes to his parents, and by other considerations, if not of a filial, at any rate of a prudential character, to make at least the attempt to acquire information at the schools and hospitals of which he may become a pupil. Some of our lecturers are men of industry and attainments. Moreover, many of them are stimulated by an earnest desire to exccute their self-imposed duties honourably and consistently. Of other teachers no such language can be held. Their industry often ends with the second week of October. How are the students to discriminate? This is a question most easily proposed, but not so easily answered, either by ourselves or by others; because we find in the reports which ware communicated to us by pupils, that a lecturer who may be energetic and instructive during the session of one year, is slugish and uncommunicative in the session of ther year, circumstances of conduct events, when it is & whole of the pr

chartered medical corpotations. The " certificates" must come from "recognised" schools, otherwise they are spurned by the Courts of Examiners. The student may have passed the whole of his life in the hospitals and dissecting-rooms of Paris, - he may present himself for examination with his mind well stored with a knowledge of all the principles and facts of medicine; but he would be scouted, he would be in danger of a kick from the sturdy beadles, at the doors of the colleges and halls, unless he had purchased "tickets" or "testimonisls" from men whom it is very probable that he would himself be capable of instructing.

As we have already stated, a student may have laboured with the greatest possible assiduity with a surgeon in a country town of England. Still he is subjected to precisely the same treatment when he visits the schools and colleges of the metropolis, as though he had not acquired an elementary knowledge of a single branch of the profession. Whatever, we again repeat, may be the attainments of any student in the science and practice of medicine when he reaches this metropolis, he will here find new sources open to him, which he may render available to the purposes of study. and improvement. Our hospitals are capacious; they contain an immense number of patients; and some of the schools are regulated by gifted and instructive teachers. In some of the hospitals, the medical officers attend with regularity. In others they attend most irregularly; and in some of them. all the medical officers actually attend at the same hour, in order, as it would appear, to prevent the students from having the opportunity of observing more than onethird of the practice. Having, however, resolved, a month since, not to allude specially to any one of the schools as an object of advantageous comparison with the mass which will not be regardles incompatible of those institutions, we take this opportuteled-that the nity of recommending the students to exthere arine, with the utmost care and attention as they can find time to estimate, and after ing on what conditions they pay the fees, public.

At our public hospitals no entrance fees ought to be paid. They are public institutions possessed of enormous wealth, and the public have a right to insist that all the instruction which a mere view of the cases can afford, should be presented to the students gratuitously, under proper restrictive regulations, devised in a spirit of liberality towards the medical public, and of anxiety for the welfare of the patients. Yet for witnessing the medical and surgical practice alone of the endowed hospitals, upwards of forty pounds are demanded from every pupil. And this is an imposition which the governors of our charities have every where allowed to be practised by the medical officers. Nav, in one of the old hospitals, during the last session, a sum was paid by medical students exceeding eight thousand pounds sterling. The students, however, have the full opportunity of know- saries 2545

seeing as many of the schools and hospitals for what purposes the fees are paid, and as they have leisure to inspect), the pro- what are the promises made in the hope of spectuses which have been issued from the obtaining those fees; and if they afterwards different establishments, when, on finding submit to be neglected and to be treated that the promises of the performers are with contempt,-if they allow the promises suited to their mental wants (to the wants of and pledges made to them on entering, to be the students), they have only to determine broken, and to remain unredeemed, without that those promises shall be fulfilled when insisting on the concession of their unthe fees are paid, and to take care to obtain doubted rights, why it will be allowed that for themselves at least the execution of the functionaries of our hospitals knew that those duties which the fee-takers pledge they were not treating with young men, but themselves so liberally to execute. If a with children, and that shadows instead of single class of students would but act with realities would satisfy the unreflecting spirit in this respect, it would operate with claimants for redress. Aided by the indesudden and prodigious effect in improving pendent portion of the medical press, it is the condition of the students throughout all, in the power of the pupils to remedy many the medical schools of the empire. Hitherto, of the minor abuses which still operate to the prospectuses appear to have served no the disadvantage of the latter, in the hospipurpose, after the first or second week of tals, dissecting-rooms, and class-rooms, of every medical session, beyond that of entice- ; this metropolis; and in conclusion we assure ment. But the lecturers act most unjustly them that, so far as this journal is concerned, towards the students if they make pledges the pages of THE LANCET will ever be open which cannot be redeemed, and have no to receive and promulgate their well-founded right to complain if, for their delinquency, complaints against parties who may either they are held up to the indignation of the designedly or ignorantly have attempted to interfere with the successful cultivation of their medical studies.

> THE extract in the next page is taken from the report which has been presented by the Poor-Law Commissioners to the Secretary of State for the Home Department. There will be found in this extract some curious matters for reflection. Several of the subjects briefly noticed therein, ought to engage the attention of the profession generally, and if we could be furnished with the results of their cogitations thereon, they might prove of use to us in the progress of labours.

Instances have services, under competition. Amongst the come to our knowledge where, in large inducements to accept these appointments, populous parishes, the profits of attendance are the credit of the appointment of medlupon paupers under such circumstances cal officers to a union by a Board of Guarhave been upwards of 300% per amount dians, the wider fields these appointments The inferior officers have been feed by the offer for the display of care and skill, and medical officers to search out and give him for obtaining reputation leading to more information of the cases of this description. Profitable practice inducements differing in As a further evil of this system, we may degree, but similar in kind to those upon mention that pappers with their families which men of the most eminent skill find it have been removed from their parishes at a to their interest to give their services to the great expense, when each head of a family chief medical institutions of the country. would otherwise have preferred remaining We may be sure that the medical practitioner and seeking employment in the parish where will, in fixing upon his terms, do nothing his sickness occurred. By countenancing which he considers will not on the whole be these practices, parishes were in the habit advantageous to himself; and next, that he of creating burdens for each other. As a will consider the interests and advantage of check to this system, and to the general expense of medical relief, we have generally cessary, as a security against undue charges required that medical services should be reeven under competition, to adopt as a rule
tained by contract and open tender, including as a condition, that the medical officers
lief within the new unions, shall not exceed
should attend at the same charge, all pathen aggregate of the former exponditure for
tients on the order at the overseer, whether | medical relief in the separate parishes now the patients were partitioners or non-pa- included in the unions. Instances have occurred where the local medical practitioners of medi- have combined to prevent a competition. have The course taken in these instances for the

protection of the rate-payers, and to secure the best treatment to the paupers, has been to suspend our sanction to the appointments, and to cause advertisements to be made to throw open the office to the competition of practitioners from a distance, or of the profession at large.

In some unions, as in the Wycombe union, it has been provided that the terms of the contract should be a remmeration, at a given sum per head, on the number who receive medical relief; but with the proviso, that the gross charge should not exceed a given amount. It is stated to us in evidence, that this mode of proceeding, though adopted reluctantly by the medical profession, has operated very beneficially. The surgeon of the Amersham union states, in

the course of an examination,

"I approve of the system; but the amount in the present contract is inadequate; I think I shall lose a guinea a week by it. In some of the parishes it is at present only one-third of what I have received in former years for the same time. But I approve of the system for these reasons: it is a selfacting check upon the relieving officer in giving improper orders, or withholding proper orders; upon the applicant for medical relief, in making him feel that in receiving it he is a pauper, and causing the parish a specific charge for him; and upon the medical man, by causing an inquiry into each case, so that none can escape attention; and by that means also secures proper attendance to the patient. Indeed, the mode of contract forms a complete system of check and security in cases of pauper medical relief, the want of which was so much felt under the old system.

"Has it tended to curtail the evil of sending all parties to the parish doctor for medical relief, which was so prevalent under the cases of contract in gross ?- Yes, it has; I have many cases now that I am attending as independent patients, who used always before to come to me as paupers. One case is that of a woman of Penn; her son is a master bricklayer, with whom she resides. the cottage and garden their own. She has a daughter about thirty, a sempstress, who gets a very good living. This woman was, with her daughter, always attended by the parish. On my telling this woman that the parish paid a specific sum for her, she refused to be attended, and now pays for herself. There are many cases which evidence ing manner. this effect of the system.

"Of course, the new independent patients

pay you?--Yes, they do; they pay us at the time they have the medicine.

"Now, although you do not receive so much from the parish contract, will not the amount by these new independent patients more than make up the difference?—No, I think not; but it will go towards it."

We anticipate that the introduction of a better system will be beneficial for the destitute sick, as well as beneficial to the labouring classes generally; and that it will be found conducive to all proper interests of the respectable portion of the medical profession.

It will, however, he observed, that the change in the system has not, in many instances, been so long in operation as to acvelop the whole of the effects which may be anticipated from it, in promoting voluntary and independent associations, to provide for the casualties of sickness and mortality.

But even now the reports made to us of the very satisfactory effects of the operation of the rule, are becoming daily apparent. We cite the following passage from a recent Report made to us by our Assistant-Commissioner, Mr. Hall, as illustrative of the tenor of other incidental communications on the subject:—

"The good effects of your arrangements as respect medical relief, are showing themselves in the shape of medical clubs among the labourers. One of the surgeons of the Wallingford union told me that several were in process of formation in his district; and I have heard that elsewhere the labouring class has evinced the same degree of foresight and providence, has given the same proof that, when thrown upon his own exertions, the independent labourer can and will adopt measures answering to the necessity of the case."

Mr. Gulson states, in a recent Report from Oxfordshire.

"Medical clubs are starting up in all directions. The proceedings of the Board, as regards the medical department, have already been productive of the hest results. Highly respectable medical men are undertaking to attend all cases for an annual subscription of 2s. for a single person; and for 4s. 4d. they engage to attend a whole family, however large, so that it does not include children above sixteen years of age. At Witney, Benson, and other places, the labourers are subscribing in considerable numbers to independent medical clubs."

Mr. Gilbert reports to us, that in several parts of Buckinghamshire similar effects, resulting directly from the change of medical relief, have been developed in a striking manner.

The increase of provident institutions, as arising from the general influence of the change of system, was confidently anticipated from the marked increase of deposite in the savings banks; espoits by labourers who had previously then patients, observed in several of the particle, which were the carliest districted. The santicipation has been saved.

of the prosperity of the existing provident is assumed to be the enemy of the pupils on institutions, and by the increase of new institutions coincidently with the change of the law. Mr. Tidd Pratt, the Barrister ap-pointed to certify the rules of Savings Banks and Benefit Societies, states to us-

"That the increase in the number of Friendly Societies since the passing of the Poor-Law Amendment Act, has been very considerable as compared with the year previous thereto. From the month of August 1833 to August 1834, the number certified by me was 360; but from August 1834 to the present time, I have certified nearly 750, being an increase of 390, or more than double the number certified in the previous year. Independently of which, I am happy to say, that these Societies appear to be founded on calculations more likely to enable them to fulfil their engagements with the members, than those which were here-. tofore in existence; and this I attribute, in a great measure, to the rules and tables against even the most improbable incidents which have been printed by order of the Lords of the Treasury, and gratuitously distributed.

"With respect to depositors in Savings! Banks, the increase during the last year has that the obstacles originate in design, to make been very considerable. The accounts are made up annually to the 20th of November; and although from November 1831 to No. the acts of secresy, the dates of their occurvember 1833 (being a period of two years). the number of depositors increased during that period 44,750, yet from November 1833 to November 1834, the increase in the number of depositors has been nearly 33,000, and in the money deposited, nearly a million; and in each of the following of the "Case Book" of a public functionary counties, viz., Bedfordshire, Berkshire, Bucks, in a public hospital. Cambridgeshire, Essex, Hertfordshire, Kent, Norfolk, Suffolk, and Sussex, a marked increase has taken place in the number of the be obtained, whether of clinical clerks or small depositors.")

SEVERAL students who are attending the practice of St. Bartholomew's Hospital, state to us that obstacles are thrown in the way of their examining the Case book which is kept in Matthew's and Mary's Wards in that establishment, whenever they attempt to inspect it for the purpose of deriving information relative to the patients in those parts of the Hospital. We refrain, however, from publishing any of the communications that have reached us, because they are couched in three of indignation which, at present, we have resent to hope, are not correctly applied. The

this occasion, but that gentleman cannot be desirous of rendering such an interposition a matter of public inquiry at this juncture. The case of a medical officer who would act as our correspondents allege, would prove a bad one for the defendant before a tribunal of public inquiry, from whose scrutiny there could be no escape, and whose members were not to be blinded by any holeand-corner physician in the metropolis. What reasons for enjoining secresy respecting his mode of treating the sick-poor in St. Bartholomew's Hospital can Dr. LATHAM

However, as it is as well to be provided of an untoward character arising out of events which affect us in life, we recommend those gentlemen who may be satisfied exact note of the circumstances attending rence, the names of, and all essential particulars respecting, those with whom they may originate, or who may act as agents of the principal, or in any way abet the hidings

The names and addresses in full should nurses, and information forwarded to us relative to the extent to which the restriction may be carried, -whether the book be whelly kept back from inspection, or opened to view only at such inconvenient times in the presence of such persons, and in such manner, as to prevent students from examining the book with comfort and advantage in the pursuit of their inquiries. All these things should be especially noted, in order that the measures adopted in defence of the pupils and the public may be complete, both as regards the remedy for the evil and its effectual exposure.

THE following recommendatory "testibalties expe- monials" have been forwarded to our office for insertion in the advertising columns of THE LANCET, but as we can find a far more | much light from their researches. H. Griproper and striking place for one of them, than even the very best part of our cover affords, and as it would be extremely unfair to Mr. GRIMSTONE to give a more conspicuous position to the advertisement of Mr. BATTLEY than to the advertisement of Mr. G .. - the two being so exactly similar in character and object, -moved by these considerations, we present them both to the profession in this place :-

ADVERTISEMENT .-- Copy of a Letter sent to Mr. G .- "Dear Sir, - I here beg to inform you, that my ears, thank God, continue very strong; and I have had no defect in my sight since my taking your car sunff, although I experienced so much pain in that delicate organ, the ear, for many years prior to my using your valuable invention. Sir, I send you this as a further testimony to my last, in January, 1834. I shall be glad to give my testimony to the unexpected relief I have received from your car snuff, having tried almost all the skill of the profession, and they failed in relieving me, or giving me that substantial relief from deafness your snuff has. Yours with much respect,

" H. PLUCKWELL.
"Tottenham, Middlesex, May 27, 1835."

WHO NEXT, WE WONDER?

Essai sur la Colique de Plomb .- These de M. A. GRISOLLE, Interne Hotel Dicu.

This essay is one of those productions which from time to time reflect so much credit on Paris as a school of medicine. It is not a simple thesis, written for the mere purpose of obtaining a diploma, but a profound investigation of a subject which has often occupied the serious attention of practitioners, without receiving too

solle is a pupil of the Louis school, and the thesis now before us is a proof of the immense superiority derived from a careful and accurate examination not only of the symptoms generally attributed to any particular disease, but of all the symptoms which the patient may present during the course of his maluly. Pursuing this method, M. Louis and his school have not only arrived at the discovery of several principles which had been overlooked, from time immemorial, from want of attention and corolleration, but they have also thrown an immense light on symptomatology and diagnosis. M. Grisolie's thesis consists in an analysis of fifty-eight cases of painter's colic observed by him with minute attention at the Hopital Bearing during the year 1834. We shall notice some of the most interesting facts which he has established.

M. Chomel is of opinion that painter's colic is much more frequent in summer than in winter, and attributes this difference to the greater activity of the works in lead during that season; but in a manufactory, where the same number of workings were employed the whole year round, the author found the average proportions as follows:for the warm months (May, June, July, and August; 103; for the taiddle season 93; for

The age seems to exercise a certain influence on the sasceptibility of contracting the from 30 to 40, 40 to 50, and 50 to 57; we find the following to be the mean residence for each in the workshops, before contraction of the disease, 65, 60, 58, and 37; hence the number of days necessary to gain the disease, evidently diminishes with the age.

Authors are generally of opinion that the red lead is more injurious than the white, but there are few or none who support this assertion by a comparison of numbers; in the absence of other facts we must accept the testimony of the author, who found that eleven workmen at Clichy could work at red lead during a period of seventy-three day before they fell ill, while the workmen on white lead at the same establishment fall ill before a language sixty-five days.

sistence of the brain was diminished throughout, but there was no trace of injection or of serous or sanguincous effusion in any part of the nervous centres.

The treatment of the colica pictonum has been various. That employed in the greater number of cases recorded by the author was the method so universally known as "the treatment of La Charite," and which consists in giving opium with purgatives, by the month or rectum. The purgatives, however, are what we in England would call laxatives; thus the lavement most commonly administered was-

R. Decoction of Senna [5i]; Sulphate of Soda, Mercurial Honey, na. 5ij; Water q. s.

These lavements were administered alone, or combined with opium, to sixteen of the patients, of whom seven were affected with the disease in a very intense form. During the course of the disease, which on an average lasted five days and a quarter, they took six lavements, and five grains of opium. The other nine patients were affected less intensely; they were cured in four days and a quarter each, and took about four lavements and three grains of opium. This latter remedy was never administered until the constipation had been overcome, and the nationt already more or less relieved. In six cases purgatives were given at the same time by the mouth and rectum; under the latter form they produced more abundant evacuations and most relief; these patients were cured in a period of seven days and a quarter. Three different kinds of purgatives were employed, viz. castor oil, mixed with one to three drops of croton oil, and the huile d'epurge, a lead remedy. En remné the patients thus treated by the evacuant method were cured in a period varying from five days and a quarter to eight days, the maximum of treatment.

Within the last few years M. Gendrin has energetically insisted on the value of sulphuric acid, both as a prophylactic against the colica pictonum, and as a remedy for the disease when fully established. However, the researches of M. Grisolle seem to throw more than doubt on the first of these properties. Thus at the manufactory of Clichy, the mean duration of the workmen before catching the disease, is seventy six, when they have not drunk the sulphuric tisan; ductions

the anfractuorities nearly effaced: the con- | while those submitted to the prophylactic treatment of M. Gendrin, do not remain more than fifty days free. As to the comparative value of the treatment called that of "La Charité," and the acid treatment, it requires a more extensive comparison of facts than we as yet possess, to enable us to judge between them.

> The Gums, with late Discoveries on their Structure, Growth, Connexious, Discases, and Sympathies. By GEORGE WAITE, M.R.C.S.L. Longman, 1835, pp. 160.

THE principle of the division of labour has been applied to medicine from a very early period; in Egypt, Greece, and Rome, when civilization had reached a considerable pitch of refinement, besides physicians, surgeons, acconcheurs, rhizotomists, and pharmacopolists, medici ocularii and medici dentarii were found exercising their respective vocations with distinction. In the precent day, the "world of man" has been mapped out into so many compartments, that it is, perhaps, time to inquire whither the division and dispernherment is tending; whether the great connexions of the whole are not broken up; whether the general laws which govern the inside, the outside, and every individual part of our frame, are not overlooked; and whether the influence exercised on organs by each other, and by external circumstances, is not forgotten; whether, in fine, the science of medicine is not sacrificed to a great many arts. One man pays particular attention to the stomach; another watches over the biliary secretion of the kidneys or the bladder; this takes the lungs under his especial protection; that counts the beatings of the heart, or regulates the workings of the mind; Mr. Alexander takes care of his Majesty's vision: Sir Charles Mansfield Clark waits upon the Queen; Mr. C. by some strange fortune humbugs the Royal car; and Mr. D. puts in. claims to perform the same kind of office to another section of the Royal Person, "et adhuc sub judice lis est."

Interesting as an extended inquiry into the effects of the division of labour applied to medicine would to, we have here only time to point it out as worthy the attention of several iserations gentlemen whose proionally fall under our notice. want a hero, so they often want a subject, the mind. at least "a new onc."

We pass over Mr. Waite's rather fantastical application of an old doctrine concerning the four ages of man, and the seasons of the year, to the teeth, which would thus bave their spring, snumer, antumn, and Winter; as well as his illustrative quotations from Sophocles and Pindar; and shall extract his "Synopsis of the Diseases and Morbid Alterations of the Gums."

Synopsis of the Diserses and Morbid Allerations of the Gums.

"Diseases produced by proximate causes. "Infantine and puerile diseases of the

larity. Foulness, languet. alough of the capillary vessels.

Morbid sensibility. Heart

and convince us that as poets sometimes induced, including the various passions of

Atrophy and atom of the sum.

Absorption of the socket and recession of the gum.

Languer, and the same morbid sensibility as results from the use of mercurials."

Mr. Waite's remarks on false teeth merit attention.

"Another condition in which we must consider the gums is that into which they are often brought by the unrelenting work of the tooth-maker. A tooth may early in life have been pivoted, and perhaps have gone on twenty years with tolerable comfort. This is often so when the root on which the tooth is pivoted is sound and good. The case, however, now alters: the root becomes either loose in the socket or worn by the pressure of the pivot, and it is necessary to fix it in another manner. This is effected by means of a plate of gold stamped exactly to the shape of the vacant gum and adjoining teeth, round which clasps are worked. The best contrivances of this nature which we meet with are those worked for many of the eminent tooth-makers of London by Mr. Claudius Ash of Broad-street. Those persons who profess peculiar methods of fixing false teeth, and pretend that inventions belong solely to themselves, are generally the adventurers of the town. The great secret of false teeth consists in employing scientific manufacturers."

Mr. Waite's work displays a better knowledge of general physiology than is possessed by ordinary dentists, whose ignorance is generally as prefound as their plunder is enormous.

Rust's Magazine, &c.

THE last No. (No. 2, Vol. 44) of this journal contains:-

- 1. Fragments from the note-book of a clinical lecturer. By Professor BENEDICT, Breslau.
- 2. Remarks on several of the Symptomatic Affections which coexist with increased sensibility of a portion of the Spinal Column. By Dr. Ess. (Continued from No. 1.)

3. Case of obstinate Retention of Urine, produced by Inflammation and Supporation of the Prostate By Dr. ANGERSTEIN.

4. Case of immense Lipomatous Tumour. By Dr. BKHB. (With a plate.)

Although an attempt has been made by Mr. Green, at St. Thomas's Hospital, to render some account of the medical statistics of that institution, and an announce-"5thly. Constitutional debuity, however ment of a similar attempt is made by Mr.

South, "of that lik," yet we are quite the operation, when the left kidney was certain that the creation will rarely be ful- found in a state of supportation, and the lowed, and that the stander of our public medical charities will not be made public, until the management of those establishments is in new hands, which, thank God, it soon must be. We have been frequently asked by some of the principal surgeons in Paris, to point out any work or journal in which they might seek for accurate accounts of the number of patients treated in the London hospitals, the comparative mortality of each, in short, any statistical survey of their population; but we have as often been compelled to answer, that our surgeens are in general too much occupied in making money to attend to anything not immediately connected with that absorbing object. For ourselves, being convinced of the great benefit which may be derived by amassing together these statistical details, so as at length to form the basis of general deductions, we shall not fail to gather, from time to time, the valuable fragments scattered through our foreign contemporaries, and thus in some measure supply a want which had much better have been satisfied by our own countrymen.

1. PROFESSOR BENEDICT'S FRAGMENTS.

The first article we have to notice in the present No. of Rust's Magazine, is a kind of review of the surgical clinique at the University of Breslan for the years 1528 to 1833 inclusive. The number of patients treated during that period was 5712, viz. 2812 surgical, and 2900 ophthalmological cases; however, the number of the former selected for clinical purposes did not exceed 700, to whom alone the following observations refer.

LITHOTOMY.

This operation was performed during the six years, thirteen times; once on a girl of twelve years; the rest on males, the oldest of whom had reached the age of fifty-three. All these patients were cured, with the exception of four, none of whom died immediately after the operation. Thus one of these four, a boy sixteen years of age, had been dismissed cured from the establishment, but died eleven weeks after of typhus fever. The second died fourteen days after

right one engorged. In the third case, death on the 11th day, evidenced suppuration of the left kidney, extending down to the pelvis. The fourth case was fatal on the fourth day from peritonitis. In reference to lithotomy, Professor Benedict relates a very curious case, which, on account of its termination, i.worthy of record. The patient, fifty-three years of age, who had long suffered from symptoms of stone, was received into the hospital in 1816, but left it without an operation having been performed. After a lause of twelve years the patient presented himself again, but during this time the calculus had acquired such a magnitude, that whenever the sound was passed between it and the bladder, it became locked. It was thought searcely possible to remove the stone by an operation; however, this was undertaken, and the incision being prolonged considerably towards the rectum which was not injured), the calculus was extracted after its outer shell had given way under the forceps. The stone weighed seven and a half omees, without counting several fragments that were lost. On the fifth day the patient was seized with low typins fever, without any signs of inflammation of the urinary or abdominal organs. The usual stimulants seemed of no avail, when the anthor accidentally learned, that his patient was a confirmed brandy drinker. All other means were at once laid aside, and the ratient given a lablespoonful of boundy every two hours. This treatment was followed by such happy results, that in four days the quantity of brandy could be diminished, and the patient was content with a glass at breakfast. The patient was discharged cured after some months.

LIGATURE OF UMBILICAL HERBIA.

This operation was practised twice, a.cording to Dessault's method, within the period above mentioned. Although both cases were successful, the author says he would neither recommend nor undertake it again. In these, as well as in all the other similar operations practised antecedently, symptoms of severe inflammation of the abdomen set in after the third day, and were combatted often with very great difficulty. The author has gequently removed funguid excrescences from the navel of young chil-

dren by the ligature (a disease frequently curred again. Of ninety-eight amputations met with at the Clinique), without giving of the breast, which author has perrise to any of the accidents before described. formed since the charge of the

patient died of gangeme.

AMPUIATIONS.

Amputation of the extremities was performed twenty-five times; of the upper arm; five, one death; one case of medullary fungas of the fore-arm, cared; of the thigh if teen, cures ten; of the leg four, two deaths. The amputation of the upper arm was performed in three cases after Alamon's method (the funnci-shaped stung); in the rest with a single flap; that of the fore-arm with a single flap; of the lower leg, the single flap; of the thigh, in three cases, with the double vertical flap; in one case with the single flap; in one by the circular method; and in the rest, according to Guarfe's modification of Alauson's method.

CANCER.

The operation for cancer (not including cancer of the lips was performed thirtyeven times. However, with the exception done or two cases treated by arsenic and parently cured, a radical cure was not obtained in a single case.

Extirpation of the breast was performed three times, and under circumstances apparently very favourable; in all the charase re-

clinique, two ended fatally from exhaustion during the healing of the wound; and in all Herniotomy was performed sixteen times the rest, with the exception of thirteen, the cases, an error of diagnosis was committed, In one case of inguinal hernia, the patient and breasts were removed that were merely

The above results are worthy of serious attention, and serve, unfortunately, to confirm the opinion advanced by many sur-In a case of femoral hernia in the female, geons, that in most cases cancer is a conthe epigastric artery, which ran transversely stitutional, not a local disease. After an over the sac, was divided. The wounded investigation of a great number of morbid vessel immediately gave a strong gush of specimens of this disease, the author problood, and revealed the accident; the strict poses to divide scirrlus into three kinds; ture was divided, as the author i in the habit; viz., the lardaceous, the hydatiform, and the of doing in all cases of hernia, from below knotty scirrhus. Passing by the two former upwards, and from without inwards. The as sufficiently known, the author gives some divided artery was immediately fied, but the remarks on the latter that are not without interest. This is a rare affection, and, on account of its march, is frequently confounded with a malignant and fatal form of scrofela. The patients are generally affected with small knots in one or both breasts, which do not e alesce during the progress of the disease. After these appear the ordinary tumours in the axillæ, and at the same time we perceive ranges of small knots along both sides of the neck, tumours in the inguinal region, on the shoulders, and in several other parts of the body. Each of the knots now mentioned remains isolated, but approaches the skin, and finally becomes attached to it. The integrament here assumes a hard, cartilaginous feel, is covered with varicose veins, and terms into a single small cancerous tumour. The patients now generally suffer under pectoral symptoms, with abdominal derangement, and in all the cases which occurred to the author, death took place in less than six months.

Cancer of the lip was removed in fiftyone cases, all successfully except one, where the patient was in a state of great weakness at the time of the operation. The author, however, regards it merely as a palitative operation, as it invariably returns in some other part of the body, or in the cicatrix itself. There are indeed a few cases in

which the turning did not reappear, but here ! the hernia was strangulated for three days ; it was evidently a local sease, produced by the face was now sunken; the body covered some external cause, and not perfectly identical with the cancerous disease. As far as the author's observations extend, this false cancer is generally situated in the red surface of the edge of the lip, and does not pass beyond it, is more flaccid, and is chronic in its march; the sympathetic swellings in the neck are wanting. According to the opinions of modern surgeous, we may hope for a successful result whenever there are no tumefied glands under the jaw or in the neck; but from the author's experience, the absence of these signs does not justify a favourable prognosis. Either small soft tumours of the glands already exist, as may be discovered by a minute and careful examination of the parts in the neighbourhood; or the lymphatic system is implicated, without any actual enlargement of the glands, which does not take place until some time after the healing of the wound.

Our analysis shall be concluded in an early number.

Hecker's Annalen, &c. Vol. I. No. 4.

The last part of this periodical contains -1st. Practical Remarks on Rabies in Dogs, Horses, Sheep, Pigs, &c. By Dr. WAGNER. 2nd. Practical Remarks on the Use of the Exhausting Pump (Langpumpe) in which the following is an abstract :-Strangulated Hernia. By Dr. Kouller.

3rd. On the Literature of the Venereal Disease. By Dr. HACKER.

2. REDUCTION OF STRANGULATED HERNIA BY THE EXHAUSTING PUMP.

The use of the air-pump, as an agent in the reduction of hernia, was first noticed, we believe, by Professor Hauff in the year 1818. Hufeland's Journal for July 1832 also contains some remarks by Dr. Busch on the same subject. Finally, the No. of Hecker's Journal now before us contains several cases, which, as they are probably new to our English readers, we shall notice briefly.

Case 1 .- In October, 1833, the author, years from scrotal hernia. After some days though seconded by venesection and of a fit of indigestion the patient began to According to the account of his attendants, however the removed after a short time.

with a cold sweat; the extremities cold; the pulse barely perceptible. No stool for the last three days. The author had immediate recourse to all the common remedies, venesection, cold applications, parcetics, enemata, baths, drastic purges, &c., without any effect; the danger was most pressing, and nothing seemed left but the operation; bowever, the exhausting pump was tried as a last resource. Immediately after the application of the apparatus, which was placed over the abdominal ring, the operator began to perceive some gargouillement in the hernia; this gave encouragement, and in a short time, to his great pleasure, the parts were restored to their natural position. Alvine discharges were obtained in a few hours, the vomiting ceased, and the patient was restored to health in a few days.

Case 2 .- In January 1834, a female, sixty years of age, was affected with ingoinal hernia on the right side, and sodden femoral bernia on the left side; it was impossible to return this latter; symptoms of strangulation soon set in, and the necessity of an operation was agreed on in a consultation of surgeons. The air pump was applied. After the first application a little gargonillement; after the second, partial return of the gut; after the third, complete reduction of the inernia.

Professor Janekowski has communicated a very remarkable case to the author, of

Case 3 .- The patient, a strong healthy woman, fifty years of age, perceived the first trace of an umbilical bernia about two years before. The tumour had acquired some size before she experienced any remarkable symptom; it was then partially reducible, and the pains in the abdomen and swelling were alleviated by opening medicines. After the lapse of about a year the tumour became suddenly the seat of intense pain; there was obstinate constination for six days, which only yielded to general blood-letting and purgative ene-mata. On the sixth day inflammation set in, and terminated in abscess of the integuments. At the end of August the patient was attacked a second time with inflammatory symptoms, which now assumed so severe a character as to threaten her life with Dr. Kohler, was called to a Jew, sixty years imminent danger. The hernia could not be of age, who had suffered for the last nine reduced by any of the ordinary means of a fit of indigestion the patient began to peated purgative glysters. On the stiffer from pain in the abdomen, and the day the tumour became excessively pair hernia could not be returned even by a sur-nernia could not be returned even by a sur-geon; the symptoms were now rapidly ag-and a fatal termination; seemed almost ingeon; the symptoms were now rapidly ag-gravated, and the author on his arrival found the patient in a state of great danger. but at first moduced a great deal of pain;

and the taxis was now practicable with the ed "An Association of Common Naturalists greatest facility. In a few hours copious and Physicians," which first assembled at evacuations were produced, the symptoms Leipsic, and changing annually the place of of strangulation subsided, and three days its meeting, visited Berlin, Vienna, Heidellater the patient was perfectly cured.

In addition to the cases which we have just quoted, the author details six others, where the air-pump was employed with equal advantage, and adds that in twenty- Bonn; and they had, undoubtedly, con-three cases, the greater part of which were duced greatly to the improvement of the fail to justify his confidence; he therefore were always found the most zealous proconcludes, by expressing a hope that a remedy of such power may meet the general consideration which it descrees.

3. LITERATURE OF SYPHILIS.

This is an analysis, completely in the lahorious German style, of all that has been written on the venereal disease during the years 1831 and 1832. The works of authors which are analyzed (alphabetically arranged) amount to no less a number than fifty-seven, and the series is not yet completed. Those who occupy the aselves specially on syphilitic diseases will here find a fund of curious, and no doubt useful, information, for not one has been neglected.

FORMATION OF AN

EASTERN PROVINCIAL MEDICAL ASSOCIATION.

On Friday, the 25th inst., a meeting was held at the Guildhall, in Bury St. Edmunds, for the purpose of forming a society under the above name. Upwards of seventy gen-tlemen of the profession, from Suffolk, and the adjoining counties of Cambridge, Norfolk, and Essex, were present.

Dr. PROBART, of Bury St. Edmunds, took the chair, and said that the meeting originated in the published letter of an influential individual now present. The call had been responded to in a most gratifying manner, and there could be but one opinion as to the general utility of such a Society. Resolutions had been prepared, and he those gentlemen to whom they were enisition.

berg, Frankfort, Hamburg, and some other towns of note. These annual scientific meetings had continued uninterruptedlythe last having been held in the present month, with undiminished gratification, at desperate, the means now alluded to did not natural sciences, of which medical men moters. Numerous learned men from this kingdom, including many eminent physi-cians and surgeons, had annually attended the meeting of the German Association, and, amongst the fruits of that intercourse, we might trace the origin of The British Asso. ciation for the Advancement of Science, -a society first instituted about four years ago at York, successively holding its annual meetings at Oxford, Cambridge, and Edinburgh, and terminating the brilliant work of its fifth meeting lately in Dublin. It would seem that this Society was destined to raise the character of our countrymen throughout Europe; it had increased in numbers, and still more in beneficial results, yearly; and had, indeed, spread a fresh ardour in the pursuit of science throughout the British dominions. The proceedings of its medical section at the recent meeting, so fully recorded in the last number of the " Dublin Journal," had brought much dormant talent into activity, whilst the funds of the society had been liberally voted to physiological researches, determining questionable points, and establishing facts that come home to every well-exercised practitioner, by bearing directly on the diagnosis of certain diseases. Out of the British Association another had arisen, which was exclusively medical, but embraced a less extent of district—the Provincial Medical Association, instituted at Worcester in 1832, through the efforts of Dr. Hastings, and a valuable volume of transactions had appeared yearly from it, the fourth being now in the press, forming the only series of transactions devoted to medical topics that had ever been published in England out of the metropolis. This Society enrolled 500 members, but having originated in the West, it had failed to culist many gentlemen in this eastern and remote district, although intended to apply to the whole kingdom. should be happy to hear the remarks of The proceedings, said Mr. C., of the meeting at Oxford have been so amply reported, that pated. He concluded by reading the re- every gentleman now present must be acquainted with them. Before I attended that Mr. Crosss, of Norwich, addressing the chair, said that he wanth individual who had been induced to deal motion the simple means for bringing them together.

(Applause.) Is was easier to the them to have a dozen years ago to the full that the mean in this county having already made a fruitless attempt. Yet there is a conviction

amongst us of the necessity of taking some jone guinea be contributed by each member, such step; few of us can so far desert our avocations as to meet the Provincial Association our Eastern Association. (Applause.) In the six adjoining counties there are about a million and a half of inhabitants; yet not more than a few cases in the course of each year are turned to advantage through the press in the whole district. In the counties referred to, only a few medical men, I feel assured, belong to any Medical Association, and, judging from the effect of the associations preceding us, one in this district must bring forward the hidden experience of many, and awaken into fresh action and energy a valuable body of lahourers in the calling we profess. The medical statistics of each county will furnish much matter. Medico-legal science may be promoted by close attention to inquests. The district contains many hospitals and dispensaries, and reports of the practice of such institu-tions will be for the first time produced. Every man of experience in practice meets with something that might prove profitable, if communicated to his brethren. During my twenty-five years' residence amongst you, I have known many enlightened, able, and zealous practitioners in the most retired situations. The association we are met to form may gather a storehouse of public knowledge. Moreover, assemblies of gentlemen of our profession generate kindly feelings, promote good understanding, and console us in our solitary hours. Thanking you for a patient hearing, I leave in the hands of other gentlemen the moving of the several resolutions. (Applause.)

Dr. PROBART said the meeting was greatly indebted to Mr. Crosse for his able address.

Dr. Evans said he would only remark that the formation of such a society must prove highly beneficial to the profession and the community. He, therefore, proposed, "That a Society, consisting of Physicians, Surgeons, or General Practitioners, residing in the counties of Cambridge, Essex, Huntingdon, Lincoln, Norfolk, and Suffolk, or in other parts of the kingdom, should be and now is established, to collect useful information in medicine and its collateral sciences for publication, to maintain the respectability of the profession, and to promote a friendly intercourse and communication between its members.

Mr. Abbott, of Cambridge, seconded the resolution. The Society, he said, would pe-

to be paid in advance.

Dr. Bainn commended the alacrity with at the large towns of England; but we are which the case made out by Mr. Crosse, social and scientific; therefore must we have who had so eloquently addressed them, had been responded to; it was high time that provincial medical gentlemen should strive to become more useful to the profession. Being, generally speaking, as it were, rari nantes in aproite rasto, they laboured und r the disadvantages of a want of co-operation; but he hoped that henceforth their medical character would be reducated in the eyes of the public. He begged to propose, the Society do publish, in the form of Transactions, all such essays, memoirs, cases, or reports of public institutions, sent to them, as may be thought worthy of publication."

Dr. FISHER, of Cambridge, seconded the resolution. Carried unanimously.

Mr. Borrett, of Yarmouth, proposed, "That a general meeting be held annually at one of the principal towns of the counties specified in the first resolution, and that the first take place at Ipswich on the first Monday in June, 1836.

Dr. ENGLAND, of Norwich, seconded it, and said he fully coincided in the principles of centralization; he thought that stremuous efforts should be made to improve medicine in the eastern provinces, or, as railroads were becoming so general, we might soon expect to see patients travel by steam to consult the physicians of other places.

Dr. Fisher thought the time specified would be inconvenient to residents at Camhridge.

Mr. Crosse said it had been selected with a view to accommodate the profession in general. He thought the general meeting ought to take place prior to that of the Provincial Association, at Worcester, because a deputation could then go from the branch to the parent institution. (Carried unanimously.)

Dr. WAYTE congratulated his brothren on the object of their meeting, and especially on the opportunity that would thus beafforded of defending their rights and mivileges. He was not a general practitioner now, but he had been, and therefore could enter into the feelings of those gentlemen on this subject: their calling was laborious and ardnous, and they were often compelled to sacrifice their own health and comfort for the good of others. That profession was not only now invaded by both itinerant and regular quacks, but more recently by acts of Parliament-the Commissioners under the new Poor-Law Act, aiding the overseers grind the medical man to powder. culiarly gratify him by bringing gentlemen planes. He thought the profession just into friendly intercourse with each other from different places. Carried unanimously.

Mr. Jean-Renson of Framingham problement and he had no doubt their posed, and Mr. Peck of Newmarket seconded, "That an annual subscription of Application of the control of the contro

3.00

stars in the Eastern as well as in the Western | ries as were necessary to promote a scienhemisphere? He anticipated great good from the Society, and concluded by moving, "That a Council, composed of not more than one-fourth of its members, do conduct the general business of the Society, and meet in Norwich quarterly, or more frequently, as the business of the Society may

require."
Mr. Balley, of Thetford, seconded the resolution. (Carried manimously.)

Mr. WAYLEN, of Colchester, proposed "That a president, two vice-presidents, a treasurer, and a secretary, he annually elected, and be members ex officio of the council and of all committees,"

Mr. CHEED, of Bury St. Edmunds, seconded the resolution. With reference to a recent act of Parliament invading the just rights of the profession, he thought there was nothing to fear from that quarter. Let the physician, the surgeon, and the general practitioner, adhere to each other, and they had

nothing to fear. (Applause.)

Mr. HEADLEY, of Cambridge, believed it was not the wish of the Poot-Law Commissioners to make degrading proposals to the profession. He knew one of them (Mr. Lefevre) and had had conversations with him on this subject, from which he was induced to believe that the fault rested rather with the overseers and guardians of the poor. (The resolution was carried.)

The appointment of officers for the next meeting at Ipswich was thus fixed :- Dr. | the resolution : - Dr. Haviland, of Cam-Buird to be president; Mr. Crowtoot, of Beccles, and Mr. Builen, of Ipswich, to be vice-presidents; Mr. Crosse to be secretary (and also treasurer pro tempore).

Dr. Lynn, of Woodbridge, proposed and Mr. HEADLEY seconded,-That the council do assemble at Norwich in January next, to receive the names of members, and to consider all papers &c. which may have been

communicated to the secretary.

Dr. BECK proposed, and Mr. Mines, of Diss, seconded,-" That a committee of five be appointed to draw up a code of laws and regulations for the Society, to be laid before the general meeting at Inswich, and to make out a list of the first members of the Council."-The following gentlemen were then appointed as a committee :-Dr. Bayne, of Bury; Dr. Beck, of Ipswich; Mr. Dalrymple, of Norwich; Dr. Wayte, of Lynn; and Mr. Bailey, of Thetford.

Mr. MACINTYRE proposed,-"That a committee of five be chosen to prepare a Rea for effecting a junction of the present so ety with the Provincial Medical Associainstituted at Worcester, and to submit the general meeting at lpswich." This embraced, he said, one cashe principal objects of their association. A district like this would not be able to furnish funds suffisenagely such transactions

tific interest in the Society. By joining with the Western Association, they might effect this object, and be put in possession of the "Transactions" of that Association.

Mr. LE NEVE, of Barrow, seconded it. He conceived many advantages would be derived by the Society from an amalgamation with that at Worcester.

Dr. FISHER wished to know whether, after such an " smalgamation," this Society

would exist as a separate society. Mr. WAYLEN considered it would be an

auxiliary of the parent institution."

Dr. Evans said he understood that the two societies would be fused into one. He was a member of the Worcester Association, and he thought that members of that association, ought not to be called upon to pay two subscriptions; though, for himself, he would cheerfully pay two or more if they pleased.

Mr. CROSSE said the two societies would, in the appropriation of funds, be in common; in annual meetings they would be separate, excepting when the Worcester Association came into their district, and the same would be the case when their Society went into the other district. For the publication of all transactions and other useful purposes, the junction would be principally effected.

The following gentlemen were then appointed as a committee, in accordance with bridge; Dr. Baddeley, of Chehnsford; Dr. Nuon, of Colchester; Dr. England, of Norwich; and Mr. C. Smith, of Bury St. Edmunds.

Mr. MURIEL, of Ely, proposed "That an advertisement of the acts of this Meeting be circulated in the Eastern Counties, accompanied by an address calling the attention of Practitioners towards the support of the Society." (Seconded by Mr. Bedingfield.)

Dr. BECK proposed that at the next annual meeting, the Society should consider the propriety of engrafting a Provident Society on the Association. (Seconded by Mr. Abbott.)

Mr. MACINTYRE said that he was impelled to meet it with a direct negative. The proposition was not compatible with the objects of this meeting; appeared to be wholly impracticable; must involve an increase of subscription not at present contemplated; and in his opinion was uncalled for. In counties which it was proposed their association should embrace, there were al-

The ninth resolution was well calculated to puzzle the meeting. It seems to have been forgotten that the affiliation of the " Eastern Society" is the act of the wrong institution. Suppose the "Western Society," on whose funds a demand is to be made, should refuse to patronise the infant ?- ED. L.

ready societies existing, and some of them the poor? I will tell you, gentleme..., what —he could speak for that of Suffolk—though not so well supported either as they deserved to be, dispensing great relief. He would recommend that instead of attempting to form a Benevolent Society, those gentlemen who had not joined the excellent societies in their respective districts, should take the interest opportunity of doing so.

Mr. Abnorr said that they had no such society in Cambridgeshire.

Mr. MACINTYRE was sure that Mr. Abbott might soon have one there.

Dr. Evans concurred in the objections of Mr. Macintyre, and the sense of the meeting being against the resolution, Dr. Beck withdrew it.

Mr. CROSSE said it would be desirable that papers or reports intended for publication, should be forwarded as early as possible to the Council to be held in January next. Votes of thanks to Dr. Probart and Mr. Crosse were then carried with acclamation.

THE DINNER.

Fifty-six of the gentlemen afterwards dined sumptuously at the Angel, when Dr. PROBART again presided, having for his vicepresidents Mr. C. Smith and Mr. Macintyre. Dr. Evans afterwards took the chair. rious toasts followed the loyal ones. Dr. Evans proposed, amongst others, the University of Cambridge. Dr. Fisher returned thanks, and passed some high compliments on the present Regius Professor of Medicine, Dr. Haviland, whose absence he much regretted. "The health of Mr. Crosse and thanks to him for his great exertions in forming this Association," was drunk with warm applause. Mr. Crosse acknowledged the compliment.

Mr. Macinture said that there was a gentleman present to whom the profession were under considerable obligations, and who had been instrumental in the formation of this society; he deserved their consideration, not merely as a talented member of the profession, but for the able stand which he had made against the grinding system of contract recommended under the New Poor-Law Bill; and he (Mr. M.) was happy to have that opportunity of putting them in possession of the information which Mr. Bedingfield had collected on the subject. "The health of Mr. Bedingfield, of Stowmarket."

Mr. Bedingfield, in returning thanks, infant as peaker; but he would, with permission, say a few words. All the time he could spare from professional engagements, rehabeen occupied in defending the profession from the unjust aggressions of the Poor-Law Commissioners. The question, asaid Mr. Bedingfield, has been put to me several times to-day, What should we do love relative to the contracts for attendance on the

we have done in our own Hundred. My colleagues, Mr. Spencer Freeman and Mr. Bree, joined me in an address to the Directors and Guardians, expressive of our wish to remain in the same situation as we at this time occupy; we requested that we might not be compelled to enter into en-gagements which it would be impossible for us conscientiously to perform, and that if any parishes were added to the Hundred of Stow, other surgeons might be appointed to them. My address to Lord Melbourne was followed up by some strong observations in the House of Commons by Mr. Wakley, to whom in my opinion the medical profession is most deeply indebted. Mr. Wakley, in powerful and cloquent language, set forth not only the inconveniences to which medical men are subjected by the arrangements made under the new Poor-Law Bill, but also the miseries which would be inflicted upon the poor themselves, by that oppressive measure. Lord John Russell is reported to have stated in reply "that he had been assured by the new Poor-Law Commissioners, that they had provided the poor with ample medical attendance." One fact in my own immediate neighbourhood, shall serve to illustrate the tender mercies of these commissioners towards the poor. The Hundreds of Bosmere and Claydon consisted of thirty-five parishes; to these parishes four surgeons were attached; the Poor-Law Commissioners have added five parishes to this hundred, but they have only provided the poor with three surgeons! and so exquisitely indicious are their arrangements, that the poor of the populous Hamlet of Needham will have to go to Coddenham for their attendance, and one of the surgeons will have to rule from Needham to Debenham, a distance of ten or eleven miles, to visit his patients; all further comment upon this subject is unnecessary. I have been asked what we shall gain by opposing the com-missioners. If I am correctly informed, we have already gained one important advantage. The power of appointing and determining upon the number of the surgeons, and the amount of their salaries, is taken out of the hands of these commissioners, and is vested exclusively in the local guardians. A very interesting communication was made to me a few days ago by Dr. Rumsey, of Chesham, in Buckinghamshire, informing me that a society had been formed in Buckinghamshire, of which Dr. Rumse was President, for protecting the professi .. Here, gentlemen, is an organized comme ee ready to receive any facts that may to elucidate the oppressive nature of the ... aw Poor-Law Bill and the arrange these facts, and to submit them when thus arranged, to the consideration of the proper authorities.
Our interpretation of the proper authorities. tant business.

carnestly recommend you, gentlemen, to ating with the reporter of the Birmingham forward all the facts you can procure upon this subject, without loss of time, to Dr. Rumsey. I have put my hand to the plough, and I will not look back; but heedless of intimidation and slanders, I will still advocate the rights, honour, and interests, of my professional brethren. (Applause.)

Mr. CROSSE read an extract from a letter he had received from one of the principal Commissioners, which stated that they (the Commissioners) had no desire to interfere with, or direct the contracts between, the parish anthorities and their medical attendants

The company were afterwards addressed by Dr. England (who warmly culogized the efforts in Parliament of Mr. Warburton), and other gentlemen, and the party broke up about ten o'clock, highly gratified with the prospect of accomplishing the object which i had brought them together.

SUICIDE BY THE ADDER.

To the Editor. - SIR, -An adder was captured by me and confined very loosely in the folds of a thin lawn handkerchief, so that I might observe its efforts to escape. The handkerchief was laid with the adder on a grass plot, and after several energetic but ineffectual attempts to free itself from bondage, the animal deliberately inflicted a bite on its own body, and quickly died. Such an act of suicide has been asserted of the scorpion, but I have never heard of the like circumstance in an adder, excepting on this occasion. The circumstance cannot be attributed to instinct, a principle which might assist it in its efforts to escape, but could never prompt so unnatural an act as that which produced death. Let this fact (witnessed by two others as well as myself) be added to the number of extraordinary events which foil the philosopher in his efforts to deny the existence of intellect, unquestionably bestowed in various modifications on the lower animals of the creation. I am, Sir, yours truly,

WILLIAM H. THOMAS. Bristol, Sept. 16, 1835.

BIRMINGHAM SCHOOL OF MEDICINE.

LETTER FROM DR. CONOLLY.

w the Editor of THE LANCET.

-In your remarks on the Anniver-Sary Meeting and Dinney of the Birmingwere mentioned in the following letter, but,
ham School of Medicine, in The Lancet
work mentioned in the following letter, but,

Gazette, would be quite immaterial, but for the manner of its introduction in support of some not undeserved censure. I trust, however, you will permit me to say that I proposed no such toast. I was requested to acknowledge the honour done to myself and the other examiners; and having done so, it was my duty to name and propose the healths of the gentlemen to whom medals bad that day been awarded. The only other toast which I proposed was the health of Mr. Cox, senior, the father of Mr. Sands Cox, to whose exertions the Birmingham School of Medicine is so greatly indebted.

Although it may add a little to the length of this communication, I cannot refrain from giving, on this occasion, my sincere testimony to the proficiency, as far as I had an opportunity of judging of it, of the students of the Birmingham School. I have occasionally thought that the apprehensions expressed by some of my seniors in the profession, that the education in provincial medical schools would be found superficial, were not unreasonable. But I am convinced that they are unfounded. The utmost care seems to be taken to make the students well informed in every branch of their profession. The two students who presented themselves as candidates for the medal in Dr. Eccles's class, that of medicine, were subjected to a viva voce examination, about an hour and a half being devoted to each; and their answers were so satisfactory as to make it impossible for me to doubt that they had been well taught both in the lecture-room and in the hospital. A student's proficiency is, of course, only to be looked upon as an earnest of future diligence and usefulness; but, seeing the number of provincial schools now established, it is gratifying to believe that they will tend to increase the number of well-informed practitioners. My opportunities of forming an opinion, when in London, of the knowledge possessed by students from the schools of Manchester and Bristol, had previously inclined me to take this favourable view of the provincial institutions; and whoever looks at the rising provincial museums, must see that every year adds to their effi-ciency as places of instruction. I am, Sir, your very obedient servant,

J. CONOLLY. Warwick, Sept. 25, 1835.

LITERARY INTELLIGENCE.

MEDICAL REFORM IN IRKLAND.

of Sept. 12, it is stated that I present as a preliminary step to its introduction to the Theory and Practice design the profession, we do not know that we can furnish a better announcement than

that which the letter of Mr. Phelan be- have offered. I trust it will obtain the comes by its insertion in our columns. The favourable consideration of the medical v letter was not, we believe, designed for publication, but a very useful purpose may probably be served by letting the able and industrious author speak for himself in this stage of the affair.

To the Editor of THE LANCET.

SIR, - Hodges and Smith, of Dublin, who have lately published a work for me on the medical charities of Ireland, with suggestions for a medical poor law for their better regulation, are about to send some copies of it to London, and I have directed one to be sent to you, as a mark of my respect for the many services you have rendered the medical profession as well in Parliament as out of it.

Should you have leisure to glance over this "Statistical Inquiry," I am not without hopes that you will see in the effort an anxiety to be useful; and that the number of facts and returns which I have collected, and put on record, will strike you as tending to give a more rational view of the state of our institutions.

You will observe that all the information is that obtained by a private individual,--often got from persons most unwilling to would afford. give it, and, in some cases, after having left ing on being at home, in search of it.

But still I have endeavoured to expose errors and abuses, whilst retaining what-ever is valuable in our charities,—and by Clonmel, Sept. 22, 1835. such exposure, feeble and imperfect as it is, some good may and, I hope, will be done; power of giving effect to such opinions as I few days.

viewers in London, and, amongst them, whose influence as a journalist is so extern sive as is yours.

You have no idea of the difficulty of reforming the medical profession, or the medical institutions, of Ireland, -so great is the influence of the Dublin Colleges, and so deeply induced with the spirit of toryism are the governors of the hospitals &c., in numerous places. Nothing but the enactment of a well-digested and most searching law can have any effect in rendering our charities what they ought to be, a blessing to the poor, and a benefit, indirectly, to the rich and to the medical profession.

I would particularly request attention to the sixth and tenth chapters, and shall be most anxions to learn if the plan on which I have proposed that a combined hospital and dispensary system should be conducted, meets your approval. I also beg to draw attention to the appointment of inspectors, and to the proposal to publish a statistic medical report annually, or occasionally. In this land of jobbing the exposure from inspectors is particularly necessary, independent of the other advantages which they

THE LANCET.

LONDON, SATURDAY, OCTOBER 10, 1835. Vot. 1.)

[1835-36.

LECTURE

INTRODUCTORY TO A COURSE

ON SURGERY

DELIVERED AT THE ALDERSCATE SCHOOL OF MEDICINE, OCT. 4, 1834.

By Mn. SKEY.

GENTLEMEN,-It will be my duty in the ensuing course of lectures, to point out to you the means which we employ, in either curing or alleviating those diseases which custom has allotted to the care of the surgeon.

alightly differ. The practice by manipula-

those principles, known under the term of practice or treatment; and on these two subjects I beg to engage your attention for a few minutes. By principles, we understand general rules, which, although modified by circumstances, are applicable to all similar examples of disease. The principles which govern practice are based on a knowledge of the great functions of life, both physical and moral; namely, physiology; but surgery demands the knowledge of the muntomist, by which alone we can detect deviations from healthy structure; and without which we cannot advance one step towards their removal. In speaking then on the subject of the principles of surgical practice, I return to those of anatomy and physiology. The first tells us the situation, form, relation, and structure, of every part I presume I need hardly tell you, that these subject to disease. Physiology expounds diseases are for the most part external; yet their healthy functions, and their mutual dethey follow that general rule not unexceptionably, or, rather, there exists a sort of neurice on each other: we must be contionably, or, rather, there exists a sort of neurice or each other: we must be contionably, or, rather, there exists a sort of neurice or each other: we must be continued in the continued of them, how can the man who is ignorant of the surgeon is met by the purely medical the healthy appearance of the human eye, treatment of the physician. I will not di-determine its diseased condition? How will late on this topic, because it necessarily fol- he distinguish the extent to which that lows from the present system of practice, delicate membrane the iris deviates from that the large majority of my auditors combealth, who is ignorant of its healthy or prises the future practitioners of all classes normal appearance and character? Look jeasousy, no rivarry or unrerence of opinion, form, and connexion of that body? Look as regards the extent or boundaries of our at the numerous forms of accidents attendarespective duty. One thing is certain, viz., ing joints, and say if it is possible that the that the ground-work is the same, that how iman who is ignorant of their natural form, ever apparently various or distinct may be, and the connexion of their parts, can dethe structure, the proximate cause of disease, termine on the one hand, or attempt to with some modification, is the same; and remedy on the other, the accidental injury the principles of treatment can therefore but they have sustained.

There are, however, doubtless many surtion is, however, the exclusive province of gical diseases, the treatment of which may be surgeon, and this includes the extensive be effected, without any immediate reference highly important department of opera- to the science of anatomy; but is there any surgery, which, if any, presents the that does not hear, more or less, immediately eminent characteristic of surgical praction that of pathology? Certainly none. Take A course of lectures a surgical science ulcer. By what means is its progress arrested? We know that in the condition of the first comprises the print to which health, the arterial circulation of a part should remain steady and unexcited; its

temperature cool and uniform. We find destruction, a new pillar is in process of it hot, red, painful, and the vessels are erection by which the diseased fabric is for-unnaturally distended with blood; they tified, and the limb restored to health and relieve themselves by pouring out matter; action! Observe the structure of artificial the skin bursts; the unhealthy condition joints, or those from which the cartilage is of the vessels remains; the surface fails absorbed; here we see the respective ends to heal, and an ulcer follows, for there of the bone or bones, carefully rounded off is a variety of ways in which such a and polished, to simulate as much as possimalady may arise. How shall we determine the treatment? We observe the chaincrease of large aneurysmal sacs; their to. reacter, whether inflammatory or otherwise; porary protection from rupture by the dense we reduce the undue action of the vessels by layer of coagulum by which they are lined; such remedical and, having accomplished! for contraction and subsequent obliteration; this, we proceed to another stage of the —the contraction of the divided ends of large treatment, which consists in urging nature; arteries;—the formation of accidental bursar, to heal the wound. In the attempt to avert for the protection of the subjacent bone, or cure disease, the importance of this whenever the skin is subjected to continued branch of physiology is inestimable; I pressure or friction;—the almost dental would say it is the ground-work of all medi-hardness of the gum, consequent on the loss cine,-in its most comprehensive sense, a of teeth, and the approximation of the teeth knowledge of the principles of life.

both animal and vegetable, with a principle wounded intestine, by which its injured sur-which cherishes growth and which presides face becomes agglutinated to the parietes over every action of which its organization of the abdomen, or to another portion of is susceptible. The same spirit, jealous of intestine, thus closing the otherwise fatal defect, controls disease, repairs injury, and aperture;—the really astonishing co-operaby its continued influence tends to maintain tion of this healing, this protecting influence, the outward physical form, as well as to re- with the hands of surgeon, in transmitting pair the inward defect of function to which the contents of the intestine, along a devious the frame is liable. It has been called the track, in artificial anus, from the upper to vis medicatrix natura. In the language of the lower opening, and the subsequent earthe Latin poet,-

" Spiritus intus alit, totamque infasa per artus Blens agital molem et magnore corpore miscet."

advance towards the surface, but for the purpose of discharging its contents without injury to the body? The liver would appear to possess discrimination in evacuating the contents of a similar disease through the abdominal parietes, in preference to the cavities of the abdomen and chest, to which it would have nearer access. In tubercular abscess, the large vessels of the lungs are as it were, incrusted with lymph, lest their rupture should be fatal to life; and this effort is especially beautiful, inasmuch as the disease itself is necessarily fatal in its termination. For here we see the contention most vividly between an irremediable disease and the unremitting effort of this "spirit of health."

In the disease of bones, how beautiful, how varied are the exertions of this protecting principle, in which a bone is destroyed by a wasting disease, arresting all chance or power of reparation,-during the process of vege

Thus it is that minds naturally imaginative, whose flight of thought equal in celerity the movements of the playful Puck, " who could put a girdle round about the carth in forty minutes, and whose speculations cost them neither time nor labour, see through the mysteries of diseased action, trace the movements of the master mind that wills it, "and give a local habitation and a name" to the selfcreated authorities of their ill-guided imagination. It is not from men so gifted that our profession will derive much advantage or instruction. Pray you avoid them.

There is another class of men, the objec-

tion to whom is so closely associated with the preceding, that I cannot forbear alluding to them, -they are mathematical surgeons. A man's mind that has been long accustomed to direct and palpable evidence, and whose conclusions are inevitable, though the very reverse of the imaginative, endeavour to reduce the question of principle to the level of direct reasoning, who will believe nothing that he cannot explain upon the same irrefragable principles of reasoning, as lead to the positive deductions of mathematical science. The tone of mind which this study engenders, appears to me not the most desirable for a practitioner of our art, notwithstanding the immense advantages which it affords in invigorating the reasoning powers. I should be sorry to be supposed desirons of withholding my tribute of admiration for highly cultivated intellect or reasoning power; but I assert, that so long as the data are but imperfectly known or understood, and until the principles of life and the nature of their operation are brought within the grasp of our comprehension, that that man's practice must be (to use the mildest term) most imperfect, who would postpone for one hour the application of a remedy, because he could not explain the rationale or the principles of its action; and there are too many practitioners of this class.

With the action of how few of the innumerable remedies of our Pharmacopæia are we thoroughly acquainted! This may be deemed a species of empiricism, but within a certaint restraint it is essential to every practical department of our profession. You must not expect, then, that you are entering on a study, the principles of which can be reduced to a course of reasoning as certain and as conclusive as that of mathematical science. Empiricism means practice. It experience has taught us the value of, but dies

There is a natural afid well-grounded pre- | which we have obtained through anyomeans judice against what are called theorists. but those of reason. Take, for example, the The tendency of a man's mind to theorize treatment of some forms of disease of the is, ceteris paribus, just proportionate to the testicle. We find them essentially benefited activity of his imagination, and as nature by the use of emeties. What is the rationale of this? Does the disease depend on a morhid condition of the stomach? If so, a form of aperient that would relieve it of its contents in common with the whole of the intestinal canal, ought to accomplish the same end, but it does not. Local depletives, aperients, diaphoretics, are equally inefficient, and an emetic finally removes the evil. Now the stomach and the testicle have neither vessels nor nerves in common. It is referred to sympathy. Is this satisfactory? To me I confess it is not, and in the state of our knowledge I should largely prefer acknowledging my entire ignorance of the modus operandi of the rentedy, than I would mask the real difficulty by a pretended explanation, that would never be borne out by close physiological investigation. The conviction of our ignorance is the first step towards the improvement of our knowledge.

But, in the mean time, shall we withhold the emetic till we can explain the phenomena of its use? Certainly not; therefore the practice by empiricism is a necessary part of our duty. The late Dr. Gooch, the most able and most amusing lecturer of his day, was in the habit of recommending to his class some forms of medicine, which comprised a combination of a large variety of medicines in a single dose. In commenting on this " mess," as he was accustomed to denominate it, he used to say, "I combine these medicines together, because I find them answer the object I have in view; I do not attempt to explain the theory of their application; but I find them useful, therefore I employ them." With regard to this subject let me observe, that the chief object of my reference is, that I am desirous that you should not commit yourselves to an explanation of the modus operands of a remedy, unless you see its operation clearly and distinctly. Its consideration will conduce to a most important end,-that of leading you to reflect and reason, -to establish, as your groundwork, clear comprehensive premises, on which your treatment is hased; to eschew the jargon of words with which the really ignorant man involves in a mystery of technicalities the statement of his opinions. and to endeavour to trace the workings of disease by simple and concatenated steps to their ultimate termination. I attach the highest value to that instruction which teaches simple principles, -which pla before the eye of the student the first cesses of disease. I should be conterned ther, were he should to abandon in action, to place him in the path of improvement, having adopted simple and distinct, consists in the application of remedies which but intelligible views of the early stages of than I would ende

interest or his attention by vivid descriptions | whether local or general, I conceive that of extensive and uncontrollable disease. I should prefer to study nature in a case of common ulceration, in which my assistance might be valuable, to pursuing the endless ravages of a malignant growth, of the nature and source of which I may be totally ignorant, and in which the only advantage I could confer, would be sympathy for the sufferer. And here let me advert to a comnon error among students, which owes its existence to a defect in their education. - that of misnaming cases of disease by the application of the epithet " good." You hear that Mr. So-and-so has a "good case" in such a ward, or "a good case of accident has just come in; they are gone for the surgeon to cut his leg off." Gentlemen, these are not good, but "bad" cases,-bad in every application of the word, - bad as regards the patient, for his body is mutilated by the knife,-bad as regards the art, for they justly expose it to obloquy, - and bad as regards yourselves, for they afford you no knowledge beyond that derived from beholding a extensive the malady, the greater the "goodness,"-a case in which the art of the surgeon triumphs over disease, efficiently cooperating with nature in its cradication,not one in which the surgeon takes the case into his own exclusive charge, and effectually extirpates it by the amputation of the limb of which it formed a part.

Now, Gentlemen, if for the purpose of warning you against imphilosophical and unreasoning views, of exposing to you the real level of our knowledge, and of preparing you for the necessity of availing yourselves of the aid of remedies, the action of which in the present state of our knowledge admits of no satisfactory solution, I have for one moment become the advocate of empiricism, I trust that the principles of education I have subsequently advocated, will guarantee to you my conviction of its atter incompetency to advance professional knowledge. Empiricism may be employed as the refuge, without being the cloak, of our ignorance. It may prove a valuable resource, It may temporarily represent, it can never supersede, the practice of reason. We may employ it as the homage due to the unexplained mysteries of nature; but it must ever be deemed a detracting blot on the real dignity and intellectual rank of our gofession.

Having considered the principles of prac-which are so immediately founded on a ledge of the principles of life, I come to the production of almost every description to the subject of the production of disease. We cannot except from this tion of remedies. We without dilating on law even the diseases of the circulation o their various classes, whether medical or itself, which owe their origin to a defective manipulative, whether direct or indirect, | state of the nervous system. How far we

next to the knowledge of their mode of application, the most important rule I can insist on, with certain limitations, is the necessity of their being restricted to a degree of activity inferior to that of the disease they are intended to control. This I believe to be an important principle of treatment, which I can best illustrate by example. A man rises in a morning after healthy sleep, his intellect clear and vigorous, with the circulation in his brain light and free, because during sleep his brain has been subject to a fuller access of blood, by which his mental facultics have been temporarily superseded.

The return of the circulation to a part of the body that has been exposed to excessive cold, is succeeded by a degree of heat above the surrounding temperature, and productive of a tingling pain. On the same principle we are told that a warm-bath is the best protection against the intensity of summer heat. These I may call phenomena of health. The same holds with regard to discase. Headache and throbbing are frequent painful operation, which you may possibly consequences on fainting, in which the brain witness for the first and last time in your sustains a temporary loss of its circulation. lives. I conceive a good case to be suscep- and this, whether from loss of blood, or from tible of relief or cure, and then the more a shock to the nervous system, producing the same result.

If you arrest any unhealthy secretion by a too powerful stimulant, the secretion returns in quantity proportionate to the activity of the means employed.

The means usually resorted to in the acute stage of gonorrhoa to suspend the discharge, most frequently increase the disease.

If you employ moderate pressure on the surface of healthy granulations, you increase their energy and promote their growth; small doses of aperient medicines, taken at certain intervals, will tend to constipate the bowels. In like manner stimulants, whether medical or moral, are succeeded by depression proportionate to the activity of the means employed.

All this is explained on the principles of reaction,-a principle so important and so universal as to influence our treatment of almost every disease.

For the purpose of maintaining growth, and of affording nutrition to every part of the body, of invigorating it by adding new materials to its structure, and of removing those which are superfluous or old, and consequently useless, nature has established the circulation of the blood. But for the purpose of controlling its irregularities, she has placed it under the superintendence of what is termed the nervous system, connected immediately with the brain or spinal marrow. These two agents, then, concur in

may give to the nervous system an inde- | pend their natural and healthy functions by pendent authority in the production of what the period in the production of what stop to inquire; there is a difference of opinion on this subject; but we must consider these two phenomena as intimately, and almost indissolubly, connected in the performance of the various functions of life; if the circulating system be in immediate dependence on the nervous, in accomplishing the design of its creation, in no less a degree is the nervous tributary to that of the foverwhelms the drunkard, is not solely refercirculation, for its force and energy.

The term "irritation" expresses a local disturbance of the nervous system, which is generally followed by a corresponding derangement in the circulating system, and inflammation is the result. If the irritation subside, the vessels resume their natural condition. Now I may define reaction to be the rebound of the nervous system after the application of any means that have tended to excite or depress it.

Let us imagine that nature has provided this system with great dormant power, beyond the necessities of the daily functions of life, which is only called into action on great emergencies, and we shall see why this rebound exceeds considerably in degree the condition in which it was first found.

What is the explanation then of the various phenomena I have alluded to? Exposure to the cold produces contraction of the vessels, by depressing their nervous system; the cause being removed, the vessels do not return to their former condition of healthy action, but are stimulated by the unhealthy rebound of the nervous system to undue action, in which the nerves themselves participate.

The warm-bath, by promoting the cuta-neous exhalation, and raising the temperature of the surface, excites the circulation, which by the same rebound maintains a lower temperature throughout the day.

Fainting produces headache, by the reaction of the vessels of the brain, consequent on inanition. The application of a powerful stimulus to a secreting surface, excites the vessels to contraction, through the medium of their nervous system; this condition remains until they recover from the shock, when they pour forth their contents, with a violence far surpassing their degree of former condition; here I am, of course, supposing the stimulus to be considerable.

The application of slight pressure to healthy granulations, promotes their growth by simple excitement, that of a foreign body. The pressure tends to diminish them, and their increased growth is the necessary consequence: if the excitement be too great, the granulation is absorbed; and this object, where the granulations are of an unhealthy character, is often most desirable. Small doses of aperient medicines exciting in too remedies, they are either internal or exter-slight a degree action of the intestines, sus-nal, the letter being local or seneral ... We

the same principle of reaction, and if renewed at comparatively short intervals, will suspend the action of the bowels entirely. The nervous system, in its moral sense, is subject to the same laws and is productive of the same consequences, whether in its normal or morbid condition. Excessive joy is invariably attended by painful depression and distress of mind, be the stimulus moral physical. The mental anguish which able to the stings of conscience; while the furious and intractable ballucinations of the maniae, gradually sinking into exhaustion, exhibit him melancholy in spirit and powerless as a child. To uphold the physical and moral frame, and to maintain it in the condition of the fulness of health, the circulating and nervous systems must possess a uniformity of action, and an identity of power-They rise and fall together; they are indissolubly nuited. If you reduce the circulation by the abstraction of blood, to the same extent you lower the tone of the nervons system. How strikingly is the infinate and mutual dependence of the two systems manifested by the experience of every day! How entirely does the energy of character sink under the wasting energies of the bodily frame. Observe the labouring man! with limbs of giant mould, and the vigour of whose constitution and his emburance of pain appear to set at defiance the invasion of discase; subject him to the consequences of repeated abstraction of blood, or lay him up for six weeks, contending against continued irritation from a compound fracture, and his energy of character is gone, his intolerance of bodily pain is converted into sensibility the most acute; he becomes puerile, fretful, and suspicious. And will not in like manner the momentary blash of shame, or the rapid and irregular pulsation of the heart under the influence of fear, with equal force denote the dependence of the circulating on the nervous system? This intimate dependence must ever be kept in view by the practitioner. It may serve to teach us, that however extensive may be that class of infiammatory disease which warrants the abstraction of blood from the circulation. we cannot exceed the quantity which the most judicious observation would point out, without committing a double wrong.

In proportion to the excess of force in the remedy employed, will be the consequent reaction : may I not therefore with reason;" insist on the importance of that law, which edies, and restricts the activity of our which renders them efficient only whose employed with degree of force interior to-that of the disease they are destined to move?

With regard to the immediate subject of

may divide the internal remedies into those you an example: during my residence in which give vigour or frequency to the circulation, and those which diminish its force. Now in the medical treatment of disease, doubtless the latter largely predominate : of from di there, the most efficient is that of blood-letting; a remedy calculated to accomplish the greatest good, and susceptible of the great-

always at hand; certainly it is employ with great effect, and often with great ad Within a few weeks of her death, a second vantage, but that its agency is largely abused I have not the smallest doubt. There is no part of the treatment of disease which demands clearer perception and nicer discrimination, than the distinction between that condition of the circulating system, which either foretels or is actually attendant on inflammation, and that which denotes the excitement of the same system from weakness. Of all parts of the body, there is none which possesses so strong a claim on the circulation of the blood as the brain. On the abstraction of any considerable quantity, the brain appears to yield to the general amount of loss, a less proportion than any other organ or part. If you bleed an unimal to death, the vessels of the brain are found distended with blood; as though that organ presided over the body as the primum mobile of its action. Throbbing of the vessels of the brain, however violent, is naire frequently an exhibition of irritation or weakness, than of inflammation, indicating that the balance of the circulation is suspended, and that the brain is asserting its claim to a too large proportion of the residue to be compatible with its just and healthy distribution. The abstraction of a large quantity of blood cannot be justified at the hands of the surgeon, excepting for the purpose of contending against positive inflammation. I have no idea of taking blood for the purpose of reducing a patient's pulse to a certain standard. I have no idea of taking blood to avert a possible, nay, even a probable attack of inflammation; nor is that practice in any degree more warrantable, that would extensively reduce the circulating fluid, to the end of diminishing the force of muscular contraction. Unless the nervous system be cagnizant of disease, you cannot take blood with impunity; and the same quantity of blood that might be advantageously drawn, under real and positwo inflammation, might be fatally drawn without it. Nor is this principle exhibited only in reference to the abstraction of blood, but it appearains, with the same force, to y operation for the removal of a disease, ous system is not cognized. These ob-ations will, I appetchend, be found most plied.

Theseed an ope tion by Baron young woman, not of one observe, but because its position was such with regard to its neighbour, as to impair the symmetry of her foot. She suffered severely during the operation; inflammation did not succeed to an extensive Infortunately, perhaps, it is a remedy degree, but she died, apparently from the shock her nervous system had sustained. case occurred precisely similar in all its important particulars ; after being at the verge of the grave for many days, this girl subsequently but slowly recovered.

I remember to have witnessed an operation for the removal of an ignocent tumour from the shoulder of a young and susceptible woman, who, like the preceding, suffered greatly during its performance. There was something about her constitution that assured me there was danger attendant upon it. She died within three weeks of the operation, without the occurrence of any considerable degree of inflammation to

which to refer it.

I remember another patient, a female, who died after the slight operation of removing a diseased bursa from the surface of the patella. Now in none of these cases was there any pain, and little inconvenience. All these persons were in rude health, and the rude health destroyed them, because their nervous system sustained a shock for which it was totally unprepared. I might dilate on this part of my subject with advantage, but you possess the opportunity of hearing these principles enforced by his authority, to whom the profession owes much of the merit of their promulgation.

Another observation on the general subiect of remedies, is that of their peculiar action on different constitutions. Mr. Abercine is an experiment; what agrees with one man may not agree with another." We are all acquainted with the existence of certain idiosyncrasics as they are called. Some persons are severely salivated by a single grain of mercury, others are overwhelmed by small quantities of laudanum; and the repugnance to ipecacnanha is quite remarkable in some constitutions. I am myself acquainted with the wife of a medical man, who experiences a most distressing sensation whenever the stopper is removed from the bottle of that drug, oven in another room. All this tends to enforce the importance of the maxim I have endeawhich, as I have before agreesed it, the voured to insist on—namely, the importance of restricting the quantity of the remedy ap-

especially to apply to patients of shat are called an excitable nervous system, and to of applying to treatment, or the use of constant of partiageable life. Levill give remedies, internal or external, and for the

second division of this subject which yet demands our consideration, and that is the manipulative. This comprises the reduction of dislocations-the setting of fractures-the determining by the touch, or local examination, the presence of fluidindeed it includes the whole circle of operative surgery. In some form or other it must come within the experience of all of you, and though many may never possess the opportunity of acquiring the experience of operators of the highest class, yet it is impossible that you can avoid some intimacy with this important branch. Now there appertains to the public an opinion of our profession (than which none can be more erroneous), that to perform with the highest efficiency the duties of operative surgery, a surgeon should pursue his path indifferent to the wants or feeings of those whom either disease or accident has consigned to his charge. But they form this opinion, from the apprehension of an extreme of opposite evil-that of failure, during an operation, of the fortitude of the operator. Is there no medium? Is harshness or indifference the sole alternative to that unstable condition of the nervous system, which would endanger the life, or enhance the misery of our patient by failure in decision? Of the two I should deem the former the greater evil, for it pervades the whole conduct of the man. It extends to the deprivation of mental relief in no less a degree than it exhibits an indifference to his physical pain. I consider the sufferings of a patient as likely under many circumstances to obtain more probable mitigation from the sympathy of his surgeon than from his judgment. Doubtless the constant access to the exhibition of serious injuries may tend to render, in some degree, callous, the natural impulses of a sympathizing mind; but to the same end that delicacy of touch is essential to the detection of some forms of disease, so in delicacy of perception and susceptibility of feelings can the mind exhibit those endless resources which real and disinterested sympathy alone could invent and apply to the relief of the sufferer. It may be truly affirmed that the touch of the surgeon exhibits the character of his heart, and it is remarkable how striking is its exhibition.

Many diseases may be detected by delicacy of manipulation, which may really pass unobserved under a coarse and violent effort made to expose them. How often do we see men seize on a fractured leg and shake it with positive violence for the purpose of enabling the bystanders to hear the cropitus caused by the friction of the fractured ends of the bone; or, in cases of compound fracture, in which the finger is coarsely thrust into the external wound with a view to determine the direction of the fracture (a piece

most part medical. There is, however, a jof most unimportant information probably), or of scraping away with the nail any comminuted portions of bone which must escape by a later and more salutary process! Some men can never see a wound without ramming in a probe, or a director; and all these persons pursue their wanton career, equally regardless of the sufferings of their patient and of the principles of their profession. But the cultivation of this delicacy of touch is no less a matter of duty, than of policy. Its presence is, in the majority of cases, the most direct path to the confidence and to the approhation of our patient, who relinquishes his case unreservedly into our hands, persuaded that the amount of pain he may sustain no art could have dimi-nished. But it is not only as regards manipulation, but in the exercise of those numerous and highly appreciated personal attentions, the surgeon may rely with confidence that his services are esteemed, and will he liberally rewarded.

Gentlemen, at the bed-side of your patients you will learn the practice of surgery. It is not only with your finger on the radial artery that you will fully comprehend the characteristics of a full, a hard, a frequent, or an intermittent pulse,-for they are all relative terms,-or that you will discriminate the various degrees and stages of fever dependent on local injury. The practice of your profession cannot be learnt from lectures, the chief object of which is principle. What do you imagine to be the comparative advantage derived from one glance at that form of inflammatory tumour which we term a carbuncle, and that obtained from the most claborate description by the lecturer; why, in the one case the disease would be immediately recognised; in the other, the student would doubt its identity until he had referred to some more competent authority.

I remember an example of an industrious and intelligent student whose attention I directed to a case of ranula. He thought himself familiar with the disease, but with the case before him he was compelled to acknowledge his ignorance, declaring that it had little resemblance to the malady his imagination had n'c ured. The eye is the most perfect of all the senses, and least liable to imposition. It will embrace and transmit more knowledge in a single minute, than a lecturer could dictate in an hour. whizzing sound of an aneurysm, or the peculiar and indescribable sounds of a diseased heart, can only be appreciated by the ear. The condition of an abscess, the thick, ness of an aneurysmal sac, the temperatuof the skin in fever, or the peculiarities of t various and uncertain diseases of the ticle and its membranes can only be de. r-mined by touch; and what description, precise and admirable though it be, can

mig the position of a fractured leg, or the and to lay up an immense collection of iminfinitevarieties in the aspect or expression of countenance in a patient passing through the changes from discase to health. At the Lame time I do not wish to impress on your minds the belief that lectures are useless. Considering them as the only source of medical instruction, I think them useless; but they must be viewed as forming a part of truction, and a part only. Unless the knowledge there acquired be confirmed by its application, it will form but a useless compound of undigested material which could merely qualify its possessor for commencing the study of practical surgery.

I cannot conclude this introductory lecture without directing your attention (not for the first time, however, I believe) to the necessity of cultivating some qualities, without the possession of which you cannot hope, whatever success may attend your path, to possess your own self-esteem, or that of your professional brothren. It is most wonderful, how little reliance can be placed on the simple statements of professional men. They appear to see everything with a jaundiced, or at least a prejudiced eye. If he relate a successful case, its peculiarities are almost instinctively magnified, for the purpose of exciting admiration, or obtaining approbation at the success of his treatment.

All speculative men have some theory to support, or some views to maintain, to which the symptoms and circumstances of the case are made to bend. They enter not on the consideration of their subject with minds simply animated by a love of truth; or, rather, the love of truth is overwhelmed by that of some more paramount thing; but men appear desirous to obtain a fictitious importance, by identifying themselves with something wonderful, - something uncommon and beyond the reach of others; this is not honest The fact is, that the line which circonscribes the boundary of truth is perfectly defined, though easily transgressed; and so prone are we to deviate beyond it, that its barrier ceases to become an obstacle in our path, and is trampled, unheeded, underfoot, becoming more and more indistinct, until it is a positive effort to detect it. Thus truth is confounded with fiction, and the narrator can only obtain the credit of his auditors to the extent of truth, by a compound increase in his deviation from it. There is, there can be, but one course which a perfectly honourable mind will pursue, and that is neither to amplify or embellish, but to adhere to the atrict letter of truth.

This was the course adopted by one among remarkably few exceptions to the general I mean Mr. Hey of Leeds, whose single unsophisticated mind, eminently disshed for its love of truth, combined with remarkable talent for observation, afforded him the means of an unreserved stion with the progress willingsse,

portant facts in reference to their treatment. I consider his works as one of the best models of surgical literature; not elegant, perhaps, but they possess an air of truth that should be doubly cherished, because, unfortunately, they stand pre-eminent in this particular. For requisites such as there, the graces of style, and the sacrifice of truth to a well-turned period, form but an indifferent substitute.

In conclusion, gentlemen, let me recommend a systematic pursuit of study, and perseverance in its acquirement. A few cases, say three or four, are amply sufficient to engage the attention of the early student, of which notes should be taken. These notes should be made in the most condensed manner possible, but should be at the same time comprehensive, because they should embrace all the important facts which really bear upon the case, and these ouly. Practice in this part of your duty can alone enable you to give effect to this most desirable system, by perseverance in which you will possess a text-book for your future practice. Let me assure you, in the words of Lord CLARRYDON, "that there is no art or science that is too difficult for industry to attain. It defends us against all strokes and assaults of fortune. It is that only which conducts us through any noble enterprise to a noble end. What we obtain without it is by chance-what we obtain with it is by virtue."

CASE OF

ACUTE PHLEGMASIA DOLENS.

To the Editor of THE LANCET.

SIR,-The following interesting case occurred in my practice, and I beg to forward it to you for publication in your useful periodical. I have the honour to be, Sir, your obedient servant,

JOSEPH HODGSON, M.R.C.S. Spitalfieds, Sept. 22, 1835.

April 4, I was engaged to attend Mrs. Horner, of B. G., in her first confinement, which she expected would happen at about the end of June. Age 39; tall in stature; fair complexion; very irritable in temper. Says, to use her own language, that she has had so many attacks of inflammation, that scarcely an organ in her body has escaped. Desired her to pay great attention to the bowels, which were inclined to be constipated, and to keep her mind as quiet as possible.

11. Has a severe attack of pneumonia, which required three bleedings from the nauseating doses of Ast. Tart. and Ipecac., ing. Pain about the calf of the leg. Applibefore it was subdued. Blisters and expectorants restored her to health by the 28th. She went on very quietly until the

6th of July, when I was called to her at half past seven a.m., and before nine o'clock she was delivered of a full-grown girl.

7, 8, and 9. Symptoms favourable.

10. Complains of sharp pain in the uterus; lochia suppressed; pulse 120, and hard; tongue clean; bowels open. The nurse says that these symptoms came on yesterday evening, immediately after she had shown a good deal of temper about a very trifling matter. Apply Hirud. xij to the part in poultices. Hyd. Sub. gr. j; Pulv. Dover. gr. v, sextis horis sum. Encma commun. cras mane, si opus sit .- Evening. V.S. ad 3xx.

11. Rather easier; pulse softer; tongue clean; howels open; blood of yesterday cupped and buffy. Contin, medicament.— Evening. Pain returned. Apply Hirad. xx

to the hypogastric region.

12. Pain gone except on pressure; skin perspirable; tongue clean; pulse 115, and soft; bowels relieved by the enema. Apply Hirud, xij, and continue the medicine.

13. Passed a comfortable night; lochia returning; other symptoms as favourable as yesterday. Tinct. Hyoseyam. 11 xxx; Tinet. Digitalis mx; Liq. Ammon. Acet. 5ij; Mist. Camph. 5x. M. f. haust. ter in die sumend. Ol. Ricini 3ss, cras mane.

14 and 15. Going on well, which she continued to do, except being annoyed by what she called "rheamatic pains in her hips," for which some anodyne limiment was ordered. I was making my visits rather far between, with the intention of leaving her, when I received a hasty summons on the 28th. Right leg and thigh twice the size of the left; tense, and exquisitely painful in the course of the femoral vein. Says that "she felt the pain and swelling gradually proceed from the womb into the thigh and down the leg." Pulse 115, and very incompressible; tongue remarkably clean; bowels confined. V.S. ad 3xx; apply hirudines xxx along the course of the veins, to be succeeded by not fomentations and poultices. Hand. Cathart. c. Pil. Cal. gr. v statim sum.; Pulr. Dorer. gr. v; Hyd. Sub. gr. j; Extract. Hyosey. gr. v; Ant. Tart. gr. 1. M. f. pil. if, 4tis horis sum. - Evening. Blood sizy; pain diminished.

29. Pain returned; says "it is exeruciating, particularly about the calf of the leg;" pulse 120, and very firm; howels freely opened. Venesectio ad deliquium, which produced immediate relief. Contin. med. ut heri .- Evening. Pain returning: applicatur hirndines xxx. The thirty ounces of blood taken this morning were very much cupped, and very buffy.

arm, lecches freely applied to the chest, and | has slept four hours without waking .-- Evencatur hirudines xx. Med. &c. ut heri.

31. Progressing .- Evening. Slight pain in the calf of the leg. Applicatur hiru-dines xii; med. &c. ut heri.

August 1. Passed a good night; leg and thigh quite easy; swelling subsiding; May. Sulphat. 5; Infus. Rosæ 5xj; Tinet. Hyos-cyam. 111x. M. ft. Haust. ter in die sumend.

2. Leg and thigh rapidly decreasing; appetite good; allowed a generous diet. Med.

and poultices to be continued.

3. Doing extremely well; pulse about 96; tongue, as it always has been, very clean. Quininæ gr. iij; Infus. Rosæ 3iss. pain, to be succeeded by fomentations and M.f. Haust ter in die sum. Pil. Phonmer. gr. v omni nocte. Ol. Ricini pro re nata. Has nursed the whole of the time, and I am much astonished that she does not show the discipline she has undergone.

15. Patient gone on improving since the 3rd; appetite exceedingly good; bowels regulated; both legs of the same size; complains of weakness and pains in both legs; bandages to be well applied to the thighs and logs; recumbent posture for some time;

and sent into the country.

Sept. 14. I hear that she is doing remarkably well; but, as she cannot walk much, she is very irritable. I think I may say that I never had a patient with whom I had more influence.

ULCERATION OF THE LARYNX.

To the Editor of THE LANCET.

Sir,-I beg to transmit to you the following case and observations for publication in your excellent journal.

January 6, 1834. Thomas W., residing near Middleton, was affected for a considerable period with soreness of the fauces, attended with difficulty of deglutition and hoarseness, and followed by pain on pressure over the cartilages of the laryux, or when that organ was forced from side to side. During these symptoms he was tensed with a short dry cough. In this state he continued during several weeks, when the former symptoms became more aggravated, the cough being very troublesome, and attended by a fetid odour and purnlent expectoration. He had been treated by several surgeons in the surrounding neighbourhood for consumption, but without benefit. When I saw him, he was much reduced in healt1 and strength, and complaining of pain,

the larvax from pressure or motion, part larly in attempting to swallow. Degintifindeed, was very difficult, and quite in lossible if the food was solid. The cough frequently expelled fluids through the nares or 30. Limb casy; skin moist; bowels open; attemption to swallow them.

constant and profuse expectoration of fetid nisco-parulent matter, sometimes streaked with blood. The voice was nearly destroyed. the respiration hurried and difficult, and the rale sibilant sometimes produced a whistling sound. Pulse 110, small and quick; skin dry; countenance anxious; tongue loaded and furred; thirst distressing. He has some desire for food. The bowels are natural. He rarely enjoys sound sleep. On looking into the pharynx and depressing the tongue, the epiglottis can be seen ulcerated at its apex, and the surrounding tissue is highly vascular. Previous to the disease in the larynx, he had enjoyed good health, excepting on contracting syphilis a few years since, not followed, however, by secondary symp-

I directed the ulcer to be touched with nuriate of antimony, and ordered him to have sarsaparilla, broth, diet, and oneeighth of a grain of deuto-chloride of merenry daily.

Jan. 19. He thinks there is less pain in the larynx. He dozes constautly. Ordered him a pint of porter daily.

26. He this morning conglued up a portion of hone, in form resembling the right arytenoid cautilage. His respiration is rather easier; in other respects he is the same.

27. He spent a bad night; occasionally raved; cold perspiration; pulse 120, and irregularly intermittent. Since the last report he has sunk very much. The pulse is scarcely perceptible; expectoration very difficult; he frequently mutters, and lies in a state resembling an imperfect coma. At cleven o'clock this evening he complained of weight and fulness about the heart, and in two hours after, expired without a struggle.

In the translation of Lacunce's work by Dr. Forbes, Lacanec remarks, that ulcers of the broughia and larvnx are in general found in subjects whose lungs are entirely sound; but in a note appended by Dr. Forbes, the opinion of Louis is given in opposition to that of Laennec, and Louis states, that ulceration of the larynx, and more particularly of the traches and epiglottis, is peculiar to phthisis. From the cases which have occurred in my own practice, I decidedly hold the opinion of Lacance, and am opposed to that of Louis. I am in attendance at the present time on a lady residing at Blackley, near this town, who is labouring under alceration of the larynx, in whom the sounds elicited by the stethoscope indicate a healthy state of the viscera of the chest, and such was the case in the subject above-mentioned. am, Sir, your obedient servant,

EDMUND TAYLOR.
Eddleton, near Manchester,
Oct. 2, 1835.

CARBURETTED HYDROGEN.

[We received last week from Dr. Clanny a letter dated Sept. 20, in reply to the letter of Mr. Roberts which appeared in our columns. To allow this controversy to extend in The LANGET one line beyond what strict justice demands to either party, is not our intention. We are not alone influenced in this determination by the fact that the cause of dispute is not clearly known to our readers. It must suffice then, on the present occasion, for us to insert the following abridgment of the statements contained in the first part of Dr. Clanny's letter of the 26th. The remainder of that communication is published entire.]

To the Editor.—Sir,—I request that you will be pleased to insert in your valuable journal the following letter from Mr. Newman, the celebrated philosophical instrument maker, in reply to a query addressed to him by me. The statement of Mr. N. goes to prove incontestably the correctness of ail I have had occasion to write respecting the changing of the wire in my sufety-lamp.

"122, Regentstreet, London, 24th Sept., 1835.
"Dear Sir.—In reply to yours I beg to say that when your safety lamps left my house, the metal ephants which surround the wire-pante were hold in by pieces of line bears wire possing across the reliances. Part of a cell form in your lower my which was turned and the line in the research which was turned and the line in the research product of the control of the metal form the control of a could sufficient to line it, which cannot be explicitly colored were asymptoted by its rotall, enclosing the wire-game.—I am, sir, respectfully, your chedient servant. John Nawman.
"To D. Clamy, Sanderland."

As Dr. Birkbeck was not present in the room adjoining to the lecture room when J. Roberts placed the infusible piece of wire across the cylinder of my safety-lamp, he cannot with propriety assert that "it was an meckent," and that "nothing unfair took place."

I beg to mention a few words upon what I called the sanction of the honourable Chairman for my withdrawal of my safetylamps. The moment I saw Mr. Pereira drive the coal gas jet through the wire-gauze, I said (when I walked up to that part of the table on which the lamp stood), "I am satisfied that something wrong must have taken place, as such an accident as this never occurred before nor ever can again." I then deliberately used my glasses, and found that a piece of thick wire had been substituted; and upon removing my safety-lamps, I heard Mr. Upton, the partner of J. Roberts, very forwardly appeal to the hon. Chairman "whether I should not be compelled to submit my safety-lamps to Mr. Pereira's experiments." On removing my lamps, the

Chairman, Mr. Pease, M.P., put the fol- my friends, containing some "new re lowing question to me, I give it as nearly as searches upon flame;" and since mysreture tny memory permits. " Dr. Clanny, do you consider your safety-lamp as not having been tried, as it was not properly trimmed? The impressive manner in which this question was put, called me from my scat to the table, when I firmly replied, "I do so consider it." No wonder, knowing what I knew and seeing what I saw, that, to use the words of Dr. Birkbeck, "I intemperately adhered to my decision, and refused further examination of my lamp." I have a letter from Mr. Pease, dated House of Commons. Sept. 4th, at the end of which that gentleman says, "Upton and Roberts asked me whether I had any objection to state my opinion that the mismanagement of the lamp was accidental. I had no hesitation to go so far, but I stated to them that your lamp had not been tried, because it was not trimmed as directed."

As to the "Medical Gazette," I shall not henceforth read one word in that periodical, even if it ever be edited by a gentleman.

Before I lay down my pen, I beg to make an observation on the subject of experimenting upon carburetted hydrogen, or, as it is now called, "bi-hydruet of carbon," which may be of service to those who may be inclined to follow up such experiments, and which I intended to have appended to my communication, inserted in THE LAN-CET of the 19th of this month. The graduated glass-tube, containing bi-hydruct of carbon and of chlorine in noted proportions, is to be placed upon the shelf of the pneumatic trough containing water, and the whole of the tube must be covered with a cap of pasteboard, or some such substance, so as to keep out the light effectnally; but if the experiments be performed in artificial light, no such precaution will be needed. The mixture of gases must be left in a tranquil state for ten minutes, which will be a sufficient time for all the chloride of hydrocarbon, or oil-like fluid, to be formed. When we perform these experiments in open day-light, it (viz. the light) will accomplish the condensation of the olefiant gas, with the formation of carbonic acid gas and hydrochloric acid gas. This experiment appears to be an easy one, but it presents difficulties in the execution which require particular exactness. Thus it is, that if the experiment be performed over pure unmixed water, a certain portion of chlorine gas will be absorbed, which will detract from the quantity of the chloride of hydrocarbon; and if we employ water saturated with chlorine gas, the olefiant gas, in its passage, will produce a quantity of chloride of hydrocarbon, which ought not to be the case.

Last spring I printed a few copies of a small tract for private circulation amongst thought accessary, in a disease

from London I have most diligently prosecuted the subject, and find that in respect to yellow or light-giving flame ! was correct, but in other respects, having since had time to correct one or two passages, I now find no difficulty in making public my discoveries thereon. I hope in a few days to have the pleasure of transpitting to you an account of those original experiments; and am, Sir, your obedient humble servant,

W. REID CLANNY.

Sunderland, Sept. 26, 1835.

MALIGNANT CHOLERA.

To the Editor of THE LANCET.

Sin,-In the summer of 1832, when the cholera was devastating the Canadas, a tattered old man appeared in Moutreal, whom the Catholic populace were induced speedily to canonize for his successful treatment of this disease, which was at that time almost as mysterious to the population as the stranger himself. To this madern saint vast numbers of the infected were brought, who were restored to health from the most violent attacks of the inflammatory stage, as well as the worst possible collapse, even after the duly authorized medical practitioner had exhausted and relaxed his efforts The remedy consisted of a due admixture of maple-sugar, charcoal, and lard, which melange was given to his patients in large quantities after every ejection. The results were astonishing, and could be indicated in the speedy alteration of the countenances of the sufferers, and the early subsidence of voniting and purging.

We must not cry down this remedy as empirical, inasmuch as its merits appear to be effectually borne out by the employment of these agents, homely and chean as they

It is obviously improper to permit a patient to continue retching when his stomach is in a state of violent inflammation, as in cholera, without a fluid or unctuous substance being interposed between the sides of the villous coat, to prevent attrition, and afford matter for expulsion upon which the antiperistaltic action of the stomach shall expend itself rather than upon its own substance. Unfortunate in the extreme was it for the patients of those who permitted not the use of any liquid but that spirituous noi! son which added fuel to the flame. Thus lard was combined in this remedy, not cause it was the best, but the most cont lubricating agent.

Mortification and gangrage are the consecutives of inflammation; hence it was

a substance which should afford the best and most common antiseptic capable of being administered in bulk without the influence of any other qualities. This was

supplied by charcoal.

Sugar, in common with lard and charcoal, possesses powerful antiseptic qualities, combined with a stimulating property; and in the addition of this constituent the necessity of a stimulus was acknowledged by the old man, in common with the medical profession at large, who have almost uni versally admitted that principle; but unfortunately the mass of the profession (at least in North America) could not admit the axiom without taking leave of their judgment, and administering spirituous liquors to excess, and, in consequence, many hun- obtain the highest security for the miner dreds, to my knowledge, died in the same that could be obtained in a lamp. condition as they had lived, -namely, drunk. I must remark, in passing, that I consider the brandy and laudanum treatment, the one could be found that would bear the test unnatural combination of a narcotic and an of hydrogen and atmospheric air? inflammatory stimulant, to have been a stain on the intelligence of the profession, is the following: - " Had Sir H. Davy, in the disease if not of the agents themselves. Imable gases of coal-mines, found any gases The main feature of cholera is inflammation stronger than the fire-damp or light carof the stomach, for instance. I have seen buretted hydrogen, he would have no doubt no case in which congestion and inflamma- so modified his wire-gauze (without using tion of that organ have not existed. What, the objectional medium of glass), that even then, are the most proper applications to be jet: of coal-gas could not by any chance be made to it? for the stomach is in nearly the driven through it." * * * " All these exsame circumstances as those of a limb suf- periments of Mr. Pereira (therefore) go for fering from phlegmonous inflammation, nothing, as our pitman can testify." Administer substances which shall serve the with respect to this modification of the offices of fomentations, poultices, and oint-wire-ganzein the Davy-lamp, or in any lamp ments. This may be decried as quackery, on its construction, any pitman will readily but we are bound in this disease to try every testify, and with good reason, that this expedient which bears the remotest leature modification of the wire-gauze has been of a rational principle, or is founded upon carried to the full extent in all such lamus, any recognizable maxim.

I am bound also to state that at the instant of attack, a liberal bleeding, hat fumentations, Davy's own pamphlet on flame, &c., page and the administration of inecacuanha and 15, it will be found that Sir H. Davy was antimony, have been successful with my own patients. I have, ever since I lost my first case (that of a companion and friend, by the abuse of laudanum and brandy), invariably used the hot fomentation, and no circumstance has occurred to stagger my faith in its officacy. I am, Sir,

Your obedient servant, W. II. THOMAS.

Bristol, Sept. 16, 1835.

SAFETY-LAMPS AND FIRE-DAMP.

To the Editor of THE LANCET. As some parts of Dr. Clanny's letters, which are not altogether personal, repower of sufery-

quickly displayed these phenomena, to apply | prevent the ignition of that gas, I trust you will allow me, through the pages of your scientific and much-read publication, to point out some dangerous errors into which, I conceive, he has fallen. The subject is one of great interest to all well-disposed persons, and of immense importance to those who are engaged in coal miningmuch valuable property having been destroyed, and hundreds of lives lost, even within the last two years, in all probability by the prevalence of erroneous notions on the subject. I certainly do not think that the tests to which the safety-lamps in the late trial were put were too severe. No test ought to be considered too severe that could be met by any lamp then produced. One of the objects of the Committee was to they then to take lamps that were not even safe to the test of common coal-gas, when

Amongst other observations of Dr. Clanny - a practice conceived in gross ignorance of his admirable experiments on the inflamwhich will leave them in any degree useful as a means of affording light. And in Sir II. not so ill informed on this subject us has been represented. Sir H. Davy there says, " Some phenomena that I observed in the combustion of a blower, induced me to believe that small quantities of olefiant gas might sometimes be evolved in coal-mines with the carburetted hydrogen; I therefore resolved to make all lamps safe to the test of gas produced by the distillation of coal." Sir H. Davy even goes further on this most important point. At page 144 of the same pamphlet, Sir II. Davy says, " If pure hydrogen should be disengaged in any mines, the improbability of which is, however, very great, wire of a finer texture must be employed." Dr. C. says that while in town he made a promise to Mr. Pease and to Mr. which are not altogether personal, reto his own oplains of the explosive not only "an experienced," but as an "acto the fire-damp of coal-mines, and complished viewer," to analyse some of the to most explosive fire-damp of coal-mines in

has donc. Now with reference to his analy-sis of fire-damp, I beg to remark that away. No man therefore can be expected from his statement, it might be inferred, that to be attended to who recommends that this gas is naturally less inflammable than coal-gas. That it generally appears so when analyzed is true, but to believe that it is always so, is an error, which has no doubt cient, is generally attended with destruction. been productive of many of those lamentable accidents that have of late been so frequent and so severely felt in some of the mining districts; and which error therefore cannot be too speedily corrected. Fire-damp in its pure state is called "light carburctted hydrogen," from its having less carbon to its bulk of hydrogen than the common coal-gas. Consequently when in its pure state, mixed with a proper proportion of atmospheric air, personally offensive, and remain, Sir, your it approaches, in inflammability, perhaps obedient servant, nearly to hydrogen itself and atmospheric air. Happily for the miner, it is very seldoin found in this pure state, and never perhaps can be so, unless saddenly evolved in large quantities. Sir II. Davy states, pp. 30, 31.-"I mixed azote and carbonic acid in different quantities with explosive mixtures of fire-damp, and I found that, even in very small proportions, they diminished the velocity of its inflammability. Azote in the proportion of one to six of an explosive mixture containing twelve of air and one of fire-damp, deprived it of its power of exploding; and one part of carbonic acid to seven of an explosive mixture, also deprived it of the power of exploding; so that its effects are more remarkable than those of azote." Several other eminent men have shown that it is scarcely possible to get two specimens of fire-damp of the same quality. The variations of the quantities of its admixtures, which must always depend materially on local circumstances, it appears sometimes extend to at least 50 per cent. The experimentalist on a small scale is therefore frequently deceived, for he can scarcely ever come a second time to the same conclusion. Indeed he seldom gets it tolerably pure, as it is generally taken within the natural reach of the person carployed, where it cannot be otherwise than greatly contaminated with carbonic acid and nitrogen. I can, from my own experience, speak of a great difference in the inflammability of two specimens of this gas. The firedamp which was taken at a height of about twenty-five feet from a sumpt, was so highly inflammable, that its flame readily passed through a Davy lamp; while some taken near the floor of the same mine, at the base of this sumpt, had no material power on the lamp, and perhaps would not have been dangerous with a naked light. These facts show how carefully experiments, or opinions on the subject should be scrutinized. The fire-damp may come in any coal-mine, as it did so lately at the Wallsend Colliery, in a state no doubt far more explosive than it

district, which it appears the Doctor had been there for the preceding ewelve any extent of security which can be obtained, should be dispensed with where the smallest want of that which is quite suffi-

I shall close my letter, which I now do, that I may not overreach too far, if I have not done so already, on your valuable space, without taking notice of the allusion made by Dr. Clanny to the parties "concerned in uprearing a well-puffed safety-lamp;" nor to his intended insulting reference to "a pitman," "a lamp manufacturer," or other insimuations which may be considered as

GEORGE UPTON.

61, Queen-street, Cheapside. 22ad Sept., 1835.

[We have taken the liberty of suppressing from this letter every paragraph which would lead to useless and valueless controversy.-ED. L.]

THE LANCET.

.....

London, Saturday, October 10, 1835.

Tue very persons who possess less than the least influence in the election of medical officers in our public charities, are of all persons the most likely to be injured by a bad choice of hospital functionaries, and the most certain to be benefited by a good one. Those persons are the patients. The position which they occupy as claimants for the bounty of the charity prevents their admittance to the suffrage, excepting by a mode which must be described on another occasion. Every man, however, of a liberal and benevolent mind,-all those. in fact, who would place elections to public medical offices on a foundation which will ensure to the sick poor, efficient remedial aid, admit in theory the propriety of granting an influential voice in the choice of medical attendants to the immates of the national hospitals, for in the hands of those attendants are often placed the awful desti-

ze to the hospital patient is not in practice sible, the duty falls on those who hold reins of government in our medical crities, to substitute for the corrective ce of the most deeply interested parties, ue system of appointment which fully ognises in the object of the election the press benefit of the afflicted inmates, and ids to render subscribent to that end ery other consideration.

Unquestionably the form of appointnt should be such as will test the talents I scientific acquirements of the various ididates, and admit of a fair comparison ween the degrees of merit displayed, d provide the means for competent arbi-'s to pronounce a just decision as the reit of that comparison.

The truth of affirmative positions often ist be established by the evidence of gatives, which, unhappily, are too often thin the reach of those who would abolish uses in government, and erect in their ice sound principles of legislation. Inssantly does it happen, for instance, in edical arrangements, that the advantages a sound code of laws must be enforced exhibiting the deformities of one which imperfect and corrupt. On such a precament are we thrown in the pursuit of e object which at present occupies our tention. We shall first hypothesize a se, and then prove its reality.

Suppose that the election of a surgeon to i Infirmary is about to take place in one our county towns, and that a large body persons has assembled before the tribuil of judgment to witness the proceedings id to assure themselves that the duty hich the governors of the institution owe the poor and sick amongst their brethren the community, whom they invite to ater its walls, is strictly, conscientiously, rectly fulfilled.

et speaker rises to take his share the proceedings, and makes known to his

But since the direct concession of the suf- arena of competition. "All men would expect that the grounds of these claims should alone occupy his mind; because the right of admission as a candidate at all, requires first to be established; for a lawyer should not compete for the vacant office, nor should a soldier, nor a merchant, nor an artisan, nor, in order to prevent a waste of time, without impeding the principle of proceeding, should a known tyro in surgery. Amazement, however, surely would affect the assembly, on finding that the very proofs of the right to compete were converted at once into "reasons" for forthwith electing one particular man to the office, in preference to every other candidate. Great, surely, would seem the dereliction from a just principle, of that functionary in the election who should forthwith fill his exhortation to the electors with "reasons" based on unprofessional experience in affairs' of medical science, and immediately pronounce a decision in favour of a yet untested candidate. Say that for decency the speaker prefaces his observations by an admission of the high importance of the duties to be executed,-of the great "responsibility" which will attach to the chosen officer, and of the necessity that, for the welfare and "comfort of the unfortunate patients," none but "professional grounds" should influence the decision of the meeting. Then thus imagine him to proceed, plunging at once in mædias res :- " Friends and electors! I re-" commend to your choice Mr. Surgeon " DICKIN. First; because he has written a " very modest, delicate, and humble letter of " solicitation to the trustees. Therefore you " ought to elect him to cure the patients in " this hospital. " Secondly : because private " inquiries into his education and character " convince me that he possesses very high " natural abilities, that he has received the " very best education in the first schools of " Europe, bringing his education and abi-" lities to bear on his professional pursuits "in such a manner as eminently to fit fine the pareller grounds on Which the "him to cure the patients in this hospital." claim admission to a Thirdly: His teacher and perfeer in medi-

" cal practice, recommends in the strongest | " Gentlemen, these facts are overwhelming! a manner that he should be elected surgeon " influential with me, and I feel honoured in " to the institution; therefore you ought to " proposing Mr. Dickin to you as a surgeon "elect him. Fourthly, because six sum- "to the patients in this infirmary." " mers back he ceased to be a student, and " comes before us therefore now with years lent judge of the professional claims of a " of venerable experience on his head "Fifthly: because, since he received a li- Who would not laugh at this proceeding "cense to practise, he has possessed the very as at a scene in a farce,-or start at it as a " best opportunities of daily witnessing the mockery of the claims of the patients, " newest discoveries (numerous as drops of and a grossly unjust attempt to influence " hail in winter) in surgical treatment; while the electoral judges against the claims of "the other candidates have been kept in able and experienced men who had not "ignorance of these discoveries, by con-"stant employment in their libraries at to the "trustees," though possessed of " home, and in the sick rooms of patients in "long-established practices in this country the first European schools, - who possessed " town. Sixthly, my friends, and above all,-"weightier in the scale of his professional " qualifications even than the recommenda-" tion of his partner,-is the fact that he has " passed many years (as a pupil) in this " very infirmary, seeing daily its practice, "and getting intimately acquainted with " the habits and peculiarities of its USUAL " INMATES. Seventhly and lastly: The medi-" cal officers of the establishment, though " none of them personally interested in the " election of their juvenile half-colleague, " have declared that he ought to be elected. " It matters not that the inmates, whose " habits and peculiarities he has studied, " were patients in the infirmary several " years since. Habits and peculiarities run " in the breed of Salopian hospital inmates, " and will be the same in those of 1836 as "they were in the inmates of 1829. Mr. "DICKIN therefore you should elect. " Moreover, none of the other candidates " have obtained the recommendation of the " medical officers of the infirmary. On the " contrary, it is a very general custom for " the physicians and surgeons in country " hospitals and infirmaries, to prevent their " brother practitioners from possessing the " opportunity of witnessing the practice of " those institutions; and of course they "could not recommend gentlemen whom "they purposely avoid in the hospital.

Probably a ciergyman, an equally excelrgeon, seconds the nomination.

written "delicate" and "humble" letters " high natural abilities," and educated in no certificates from "partners," nor the privilege of admittance to the practice of an hospital where the oracular authority of the "newest discoveries in surgical treatment" was a youth of five or six and twenty,-and who had only been employed daily for twelve or twenty years in treating disease amongst individuals whose "habits and peculiarities" were not characteristic of a particular set of sick patients?

Yet from the life have we made this sketch, and such another could we draw from the life in every number of our journal throughout the year.

Let the reader judge how faithful is the illustration, and reflect on the facts which it exhibits, by perusing the following extract from the Shrewsbury Chronicle of the 25th ultimo. Well may the sounds of " cheering" and " continued cheering" which attended the exordium of Mr. Gork, have been arrested at the point of their actual cessation. Most appropriate were those demonstrations as indicated by the reporter, but for the assembly presently to withhold them, became a duty which was well observed. The sentences are transferred verbatim to our columns :--

on of a St Infin distees of this in of unwards of 300. mary, on Priday la

in the room of Mr. Humphreys, resigned. received within its wills, but of every medi-There were as candidates, Messrs. Higgins, cal officer upon the steakinth of the Clarke, Dickin, and W. J. Clement; but unanimously ignests recommending him as the first-named gentleman resigned, and the well attended to the situation. Such recomsecond did not proceed to a poll; the con-imagdation is of the highest value in enabling

" W. O. Gorr. Esq., M.P., rose and spoke, -It has fallen to my lot, my Lords Gentlemen, to nominate Mr. Dickin us geon to this very useful institution; but before doing so, I will briefly state the reasons that have induced me. Some time ago Mr. Dickin applied to me for my support at the election, and that I should propose him. I declined; because, although I knew his connexions to be highly respectable, still I knew not enough of Mr. Dickin professionally to support his pretensions to occupy a situation of such responsibility; for I think that this election is to be decided on professional grounds alone, and not on any per-sonal, far less political ground (great cheering), but solely with an eye to the character of the institution, and the comfort of its unfortunate inmates. (Continued cheering.) When, however, I read the very modest letter which he addressed to the trustees, in which he claimed nothing, but stated his pretensions with equal delicacy, modesty, and humility, I could not resist making further inquiries into his education and character; and these inquiries satisfied me that Mr. Dickin was a gentleman possessing rery high natural abilities, having received the very best education in the first schools in Europe, and brought that education and those abilities to bear on his professional pursuits in such a manner as to gain him the approbation of all around him, and emineutly to fit him for the situation to which he now aspires. From his tutor, and partner, Mr. Humphreys, I received a letter, recommending Mr. Dickin in the strongest mauner; and as no man could possess better opportunities of knowing him, I could no longer hesitate in affording him my humble support. The testimonials which Mr. Dickin has this day laid before you, are such as few young men ever produced. Few men of his standing have seen so much hospital practice, a species of knowledge so valuable in this institution. In 1829 he received his diploma, and since that period he has been studying in Edinburgh, where he has had the very best opportunities of daily wilness. by the newest discoveries in surgical treatment; whilst the other candidates have been precluded from this advantage, by their other rofessional labours. But above all, he has used many years in this sary house, secin the practice and getting intimately focus and with its practice, and getting intimately loquested with its about and getting for the personn his addoors duties here—so diligent ad attentive — he—that he getted the person his properties of every patient things.

test, therefore, lay between Messrs. Clement you to come to a satisfactory decision. None and Dickin. of the other candidates comes before you so recommended; and no such names as Darwin, Du Gard, or Johnson, would be attached to a document, were these honourable men not aware that the person they recommended was worthy of the praise they bestowed. I therefore feel henoured in proposing Mr. Dickin to be elected as surgeon to the Infirmary.

"The Rev. Mr. Corron seconded the

nomination."

We have thrown the burden of exposing these absurd grounds of recommendation on the fictitious oration of one of the judges in this concours of friends, and, as we hear, political partisans. But the speech in which the claims of the second candidate were. urged, may obtain from us a more pointed exposure of the errors into which the system of election upon simple nomination is calculated to lead the self-appointed guardians of the public health. When Mr. GORE had concluded,

"Archdeacon Butler rose and said,-My Lords and Gentlemen, I come forward in behalf of one who was for some time my pupil; who then conducted himself much to my satisfaction, and gave the promise of those talents which his after life has so amply redeemed. But he has a stronger claim to my services than this, arising from the many and great obligations which I feel myself under to his father and himself, for the skill and attention which they have shown for many years in their professional capacity, while attending two-thirds of my family. I have seen the medical skill of the latter exercised with a happy combination of promptitude and judgment, on more than one critical occasion,-where the result has been eminently successful,-where delay would have been minous, and where but for such decision the issue must have been fatal. (Cheers.) Mr. Clement's testimonials are before you, and when among the host of first-rate practitioners you find the names of that great anatomist and surgeon Sir Charles Bell in the surgical, and of Dr. Southey, physician to his Majesty, in the medical department, and consider the terms in which they have spoken of him, I may call them not merely respectable or unexceptionable, but of the highest order; and I am sure you will acknowledge that I am not using too strong a term to describe them. But he has something still stronger than

these to produce. I mean the direct evidence of his own taken, his own experience—his own coperative skill—all of which are not only before the eyes of his professional raries in this town and neighbourhood, he of whom, in so unusually kind a manner have come forward to attest them, but of the whole medical world. Mr. Clement has given proofs of this in his Prize Essay, for which he obtained the Fothergillian gold medal in a competition open, I believe, to all Europe; and in the volume which he has published, which has been translated into other languages, and of which, though I am not competent to speak professionally, I can trust the opinions of those who are, many of which you will find annexed to his printed testimonials. From these you may learn the ardour with which he embraces his profession, and the skill with which he conducts it; the fair reward of which, I trust, he is about to reap this day at your hands. And with this hope, my Lords and Gentlemen, I shall beg leave to propose Mr. William Clement, as a fit and able candidate to fill the office of surgeon to this Infirmary. (Cheers.)"

That of these two candidates Mr. CLE-MENT was, on the ground of experience, the fittest man to fill the vacant office, we have no doubt. That either of the candidates was not an accomplished surgeon, we have no reason for believing; certainly, however, the probability of efficiency was in favour of Mr. CLEMENT. Yet Mr. CLE-MENT did not obtain the appointment, and two other gentlemen were expressly driven from the field of competition by the mode of election,-by the institution of the false basis on which the points of merit were made to rest. But how could Mr. CLEMENT, or any candidate, expect to be elected, who suffered his claims to consist of the following grounds of recommendation? First, the voucher of his schoolmaster, that he was a clever boy. Secondly, the declaration of a private patient that he was under great obligations to the father of the candidate and ble, by the addition of the claim set up by the candidate himself, for the exercise of their professional skill and attention. Where is the patient in private life, who would tenths of the professional world probably not say the same of the medical attendant never thought twice existences of his choice? Lord Ingestrie and Sir said to be open to the state of all FRANCIS BURDETT bore a precisely similar rope." The climax of testimony to the skill and attention of John time

Long, and everybody laughed at them as a couple of dupes. Why, the first exhminer of medical talent in the world could not. with all his fitness for the office, have pronounced a higher eulogium on the medical " skill " and " judgment" of a candidate for office, than fell from the lips of the archdeacon. Thirdly, Dr. BUTLER urged Che " unexceptionable" weight of the written " testimonials" of Mr. CLEMENT. Testimonials! Why, the very name stinks in the profession. The testimonials of teachers and private friends! Hardly a name of reproach is there that can be attached to scriptorial impositions, which has not been publicly given to them by this very class of testifiers themselves (when hard pressed), as every reader of the evidence taken before the Parliamentary Medical Committee well knows. Fourthly, the electors are referred to the fact that Mr. CLEMENT is occupied in a most extensive private practice, his skill in which is notorious to his professional brethren. To say nothing of the singularity of urging the election of a gentleman who is already well occupied in a " most extensive" practice, to an office in a large county infirmary, let us observe that the skill and science of a private practitioner can be but indifferently observed by his professional brethren, and are liable to present too many deceptions to justify reliance upon them from hearsay or general belief. Morcover, the "professional contemporaries" who were declared by Mr. Gone to be the best judges of the skill and judgment of a Salopian surgeon, actually gave their decision in favour of another candidate. But the error of trusting to written and verbal grounds of recommendation in medical elections is made more palpable, if possi-Dr. BUTLER, relative to the competition of his pupil for a medal, which, although nine.

Truly, puzzled are we to say. Most probably no salary sweetens the labours of the office in the Infirmary, and the just execution of its duties must actually deprive Mr. CLEMENT of part of the very income which he derives from a highly remunerative circle of private patients. A reward, then, for what, and what kind of reward would the possession of this appointment he to Mr. CLE-MENT? Archdeacon Butlen begs the trustees to double the labours of a gentleman, as a recompense for that portion of them for which he has actually already been paid! What a very finny mode of proceeding! How odd a system of reward! Had the trustees liberally attached a salary of three or four hundred nounds a-year to the office of chief resident surgeon, and then opened the post to public concours, the word "reward" might not sound so very foreign to the occasion. It might with a good grace attend the annual presentation of a check for the salary; but as matters at present stand, we certainly do not comprehend the term. We know what is meant by the "benefit" of the patients. We wish that that was better understood. Alas! it is the very weakest spring of action in English hospital elections. Yet, professedly, it is the be-all and the end-all of public medical charities. A third speech was made at the Salopian Infirmary, and in that speech was large talk of the nativats. No feelings more considerate, indeed, could have influenced the orator than were expressed in the introductory passages.

"I rise," said Mr. Bather, " to second the nomination of Mr. Clement. Mr. Gore has told you that neither favour nor effection, neither political partiality nor personal predilection, should hias our votes on this occasion; and I, on behalf of Mr. Clement, most cordially subscribe to the doctrine. (Cheers.) Most heartily do I trust that the advice thus gives will be acted upon thoroughly in our query actions of these and provided in the control of the c

that the appointment may be given as a ments and our desired, and lead us to forget "reward" for,—ah, a reward for what? Truly, puzzled are we to say. Most probably no salary sweetens the labours of the Letter. And when that gratitude is call forth by sufferings alleviated,—or before in the Infirmary, and the just execution of its duties must actually deprive Mr. CLEMENT of part of the very income which get our duty, and to remember only our gratitude! (Cheers.)"

This is cloquent and true, but how was the well-cheered theory observed in practice? Let the recommendations urged by Mr. Gore and Dr. Bather furnish answers to the questions. To these Mr. Bather added another claim, but such another as every practitioner in Britain could supply for himself by the dozen. He said,

"In this case, with all the strongest ties of gratitude wound close around us, we are freed from any terror of being misled hy such feelings, in the perfect knowledge that the skill which averted our sufferings is, if you will permit it, to be employed in alleviating the affliction of the humblest of our fellow creatures; -that the decision which averted from us the pangs of death, is proffered openly to all; and that not by the wealthy alone, are zeal, and promptitude, and skill, and talent, to be obtained, but by the poorest and most destitute those qualities may be commanded, if you will this day permit them to be accepted. (Cheers.) Dr. Butler has told you that to Mr. Clement and his father is entrusted the health of two thirds of a family, not exceeded in number or respectability, you will allow, by any in the kingdom-certainly not exceeded in any case in the care which is bestowed upon them by that gentleman's family. My reverend friend has also told you that in the humanity, promptitude, and decision of Mr. Clement he had the utmost confidence, and to those qualities he attributed much of the healthful enjoyment of his pupils: he has further drawn such a picture of what might have arisen from the want of those qualities, from less care, less promptitude, less zeal, or less decision, as must deeply have impressed your minds with their value. Gentlemen, if Dr. Butler so feelingly speaks of Mr. Clement's abilities as regards his pupils, with what depth of feeling must I speak of him, when to the successful exertion of those qualities, under God, I owe the life of my own, son; for to that zeal, promptitude, and skill I owe his preservation! (Much cheering.) Surely, then, if gratitude forces me to what my cool judgment would otherwise lead me, I cannot be far astray in following their dictates. (Cheers.)"

It was sad to see the gashes which Mr.

under the imperfect system, kept inflicting have highly lauded. The French and Geron his own throat. He could see the mate monies be borne than the united praises of in Mr. Dickin's eye; the beam in Ma the three greatest nations in Europe? I con-CLEMENT'S, obstructed his vision.

"This," said Mr. BATHER, "is essentially a case to be decided by your opinion of the comparative superiority of one candidate over another. You are bound to select the best, or you betray your trust. We can speak well of each candidate. But look at the evidence. The first class consists of proofs of those steps which enable the candidates to offer themselves as qualified to fill the situation. But we cannot permit Mr. Gore to hold forth that as a recommendation which is only a certificate. We cannot allow him to say that Dr. Darwin has recommended him in preference to the other candidates, when he has only certified that he properly attended his duties in his situation; and which certificate could equalty be obtained by any young man who properly conducted himself. (Hear, hear.) Mr. Dickin's testimonials are all to a similar effect. Great hope have the writers that he will prove in time a useful surgeon. (Laughter.) We show you the eminence Mr. Clement has already attained. Can you hesitate which you should select, if you mean honestly to benefit the patients in this infirmary? The abilities of the candidates are to guide you in that decision. (Cheers.) Yet Mr. Humphrey's recommendation must be taken with all due allowance. Mr. Dickin has been his pupil; he has now become his partner, and to him therefore the partialities of its chief will naturally incline. For see how these matters are conducted. Mr. Sandford was the original founder of the firm; he in course of time retired, and handed over the business to Mr. Humphreys, with the surgeoncy to this institution attached; and now that Mr. Humphreys is about to retire, Mr. Dickin is to succeed him, and the surgeoncy follows as a matter of course, being handed over from partner to partner, like the scalpel and the gallipot. (Cheers and laughter.) Poverty and disease are surely sufficient afflictions; let us not add to them other evils of a vet more horrid sort; let us not promise them relief, and give them disappointment. (Cheers.) If you were to throw overboard all Mr. Dickin's testimonials, the same number abstracted from Mr. Clement's would not be missed: for his experience and repute would remain; and on what other grounds can you choose an operating surgeon? What say his fellow surgeons of him? Has he not produced a list of the most eminent surgeons in the county, strongly recommending him to your choice, throwing aside all professional jealousy, and they are but a jealous and waspish generation. Mr. Clement has given to the world his "Observations in Surgery," With that tenfold honour

BATHER, as the advocate of Mr. CLEMENT | which all persons qualified to give an opinion mans have translated it. Can higher testijure you to reflect on the condition of those for whom you are acting. I ask you, not for Mr. Clement's sake, but for the sake of the Infirmary, to appoint the man whose experience and abilities best qualify him for the place."

> " Not for the sake of Mr. Clement ?"-Why, what said Dr. BUTLER, the coadjutor of Mr. BATHER? Dr. BUTLER expressly demanded the appointment for the sake of Mr. CLEMENT,-for his " reward,"-as the Doctor phrased it. And these incongruous sentiments fall from the lips of two of the most prominent and influential conductors of the election! Is there in gentleman within the sound of Shrewsbury clock who will take the trouble to explain to these worthy and most respectable gentlemen,and such they are in every sense of the words,-the conduct, object, efficiency, and security of the concours? Conviction on those points might do some good at the next vacancy.

> The meeting was evidently in favour of Mr. CLEMENT, but part of the judges were non-residents, or at any rate non-presents, for-

> "Immediately on the conclusion of Mr. Bather's speech, a show of hands was called for, which was considerably in favour of Mr. Clement. A ballot was then demandel, in order to introduce the proxice, when the numbers were announced-

> > For Mr. Dickin 221 For Mr. Clement 168

" A vote of thanks was then moved to the Chairman by Mr. Bather, seconded by Mr. Sheppard; and the meeting dispersed."

We shall pursue the matter only a step farther at present. We cannot before leavit refrain from asking how it happened that Mr. CLEMENT, a gentleman who had, probably, no need to fear the contest, said not one word throughout the period of canvage about the election by concours? that form of appointment how w weak and unworthy have your to the wall!

have been to the trustees and the public the propriety of remunerating the great skill and talent which circumstances had rendered prominent! We do not for a moment believe that Mr. Dickin would have avoided this test of his qualifications; and what an example would be have set, what fame might he have acquired, by insisting that it should be instituted! That he, at least, could have carried the point, who can doubt? If 221 friends would vote for his appointment under an absolutely worthless system of "trial," how much more readily, confidence,-would the majority of the trustees have made an arrangement for a public and an honourable concours between him and Mr. CLEMENT! He has missed a point which he may never retrieve. We hope the patients in the Infirmary will have no cause to regret the want of courage in the candidates (if that were the want) which led the trustees into the gross error they committed in tolerating another election under the old, inadequate, and corrupt system of election.

WE this week afford our readers three or four specimens of the kind of matter which occupied the attention of the medical students in the metropolis this session at the introductory lectures. Jam satis. The system is by this hour of the month in full swing. It will die at not one point of advance beyond its merits at the day of its birth.

We observe that Sir C. Bell ascribes the rise of the Middlesex Hospital School to a desire to reobtain the pupils who have been drawn from that hospital to the hospital of the London University. What a mistake remedyl revernors should have hly americ of lattruction, and then no pu-

ful competitor have entered on the duties, see that it is the North-London Hospital of the office! How manifest then would which attracts students to the University lectures? How wayward in their principles of legislation are the old folks in the hospitals!

Sir CHARLES BRILL referred in his address to his Parliamentary Evidence. He is one of the few men of his class who can afford to do so. His opinions on medical legislation, for the most part do his courage and his discrimination credit. Let those medical students who have not yet perused them, learn what a man who has deservedly risen to the highest pinnacle of professional fame in this country, solely by the aid of his own --urged by his demands, and fortified by his industry, thinks of the present system of medical education and practice in England. They will find his evidence recorded in THE LANCET of the 25th of July last, No. 621. And while referring to it, we may take the opportunity of adding, by way of postscript to our recent remarks on the study of anatomy, and on the fraudulent system of lecturing students into a knowledge of medicine, the following remarks of Sir CHARLES on those subjects :-

> "When a young man retires from his studies, and is solely dependent on himself in practice, the knowledge which he feels the greatest difficulty in supplying, is that of anatomy. In speaking on the subject of education, I wish to distinguish between lectures which require demonstration, and those which are mere discourses. Anatomy and chemistry require demonstration. These, therefore, are the most essential to be taught by lecture. The practice of medicine and surgery requires to be taught by the bed-side. Elementary courses on these subjects may be supplied by diligent reading. To crowd a curriculum of medical study with a variety of courses, would be little conducive to a good end. There is a disposition to diminish the importance of anatomy. Yet anatomy is the groundwork of all. From that science, not only the elements but the great rules of the profession are to be drawn. I do not think that there has been any advantage derived from multhe Middleess Hospital dividing professorships, and dividing and sub-dividing the subjects of lectures (into so many courses). I fear it has often been done for left its walls. Do they not the purpose of providing for individuals.

EMMENAGOGUE PROPERTIES OF ACONITUM.

In a paper by M. West of Strasbourg, in the August Number of the Archives Generales de Med., M. WEST states that aconitum is one of those remedies which after having been praised beyond all measure, like many other new remedies, is now completely neglected in France. In Germany a few physicians still employ it in some cases, particularly in phthisis and rheumatismal affections. The author, while attending the clinique of the School of Medicine at Vienna, has seen a great number of experiments with this remedy. In phthisis its action never appeared very advantageous, but always inferior to that of the other narcotic substances. Its utility in cases of rheumatism seems more doubtful. However, amongst other patients at the school of Vienna, the author observed two females on whom the action of aconitum was very remarkable. One was a stout female, 27 years of age, affected with articular rheumatism of the left arm: her menses had been suppressed for three months in consequence of exposure to cold. Aconitum joined to antimony was administered for the rheumatic affection. The latter persisted without any change, but the menstrual discharge was quickly restored.

The second case was that of a female, 32 years of age, equally affected with rheumatism, whose catamenia had not appeared for five months: she took aconitum; the pains diminished slightly, and the menstruction These cases roused the was restored. author's attention, and induced him to make further experiments. He details three examples of successful application of the remedy to amenorrhora. In the first, the disease had been established for twenty-two months: the patient was bled, and took the watery extract of aconitum for eight days previous to the supposed menstrual period. On the 5th day the pupils appeared dilated, with other slight indisposition: on the 8th day the menses reappeared, and have continued regular since that period.

In the second case, that of a weakly girl, the menses had been suppressed four and a half years, and replaced by a leucorrhocal discharge, more abundant at each period. The patient took thirty grains of the extract

in twelve days, for suppression of the leucorrhora, accompanied by pain and weight in the summit of the vagina: on the 10th day the pain had much diminished, and the

> In the third case, the girl, 19 years of age, began to menstruate at the age of 16; the lapse of a year the discharge was saddenly arrested in consequence of exposure to cold. After five months the patient experienced severe pain in the head and abdomen. These soon changed into true hysteria, the access of which came on at each menstrual period, and was excited by any moral emotion. The patient was seen a year after the suppression of her catamenia, and then exhibited the symptoms of chlorosis in the highest degree. She was ordered general and local baths, with thirty pills of the extract, to be taken eight days before the expected period. After the use of twenty grains the catamonia appeared, and were succeeded by a very fetid white discharge; from this moment the access of hysteria disappeared, and the patient gradually recovered her health.

> From these facts and several others noticed by the German writers, the author thinks the efficacy of aconitum in cases of amenorthese cannot be doubted; as to its made of action, the author thinks it may determine the reappearance of the menses, not by any specific property (for there does not exist any absolute emmenagogue), but by calming an irritation of the uterus, by which the vessels furnishing the menstrual flux are prevented from performing their ordinary function.

RE-VACCINATIONS IN THE ARMY OF THE WURTEMBURGIAN STATES IN 1833.

Professor Heim states in the Wurtemb. Mediz. Correspondl., Nos. 10 and 11, that 1683 individuals were re-vaccinated with the following results:—34 in each 100 with success; 22 with modified results; 44 without any result. The patients were from twenty to thirty years of age. Of 577 who were revaccinated with perfectly successful results, 293 showed good cicatrices, 116 imperfect and 168 presented no cicatrices at all. Of 366 re-vaccinated with prefect results, 193 had good mark. The parfect result, 382 showed good, 222 impat, and 196 no cleatrices.

THE ARTERIES IN INFLAMMATION.

To the Editor of THE LANCET.

SIR,-In the last number of the Medica Chirurgical Review there is a notice of Professor Alison's paper on the vital properties of arteries, &c. I was glad to find, on parusal, evidence, as I thought, that journal had changed its opinion regarding the state of the vessels in an inflamed part, and of those leading to the part. On rereading the article, however, I was surprised to find that there was no change in opinion, but that the doctrine advocated by the Professor had always been considered by that journal as the true doctrine. In my own mind, from what I had gleaned from the pages of the Medico Chirurgical Review, I had settled that it was opposed to the doctrine of debility of the vessels in inflamed parts; and I was sorry for it, because from its high repute and great circulation it became a powerful means of extending an mischief. Afraid that I had all along laboared under a misconception of the sentiments of the journal, I have referred to forwill briefly transcribe from its pages some blood circulating slowly is less florid than of the remarks on which rested my opinion blood circulating rapidly. In phlegmonous of its creed.

At page 498 (Med. Chir. Review) you will find the following passage:-" Every one knew that vessels leading to inflamed parts were dilated; and it is nearly half a century ago that numerous experiments were made in Edinburgh (Lubbock, Allan, Wilson), to prove that the capillaries were weakened and dilated in inflammation, and consequently that the circulation was actually slower in inflamed than in sound parts. We have always considered this as the true doctrine of inflammation, and we are glad to sec so able an advocate of the same in the person of Professor Alison."

Compare with the above the following, which you will find at page 411, Med. Chir. Review, October 1832: - "The prevailing opinion at present appears to be that the capillary vessels are weakened and dilated, (condensed from the Bury Herald). In Mr. because by reason of that weakness, they are unable to resist the ordinary force of the heart and large vessels. This has always appeared to us a fallacious theory, although we are willing to allow that it is a specious one."

Of course the journal could not but admit of a dilated state of the vessels, but I am not aware that it ever until now admitted, that transls in acute inflammation were in a oc. of the decident of the dec ry, is i says, "should teach us

that inflammation in not always the same, that acute inflammation is remedied by what empties and relaxes the large vessels and the small, that certain forms of chronic ingives tone to them. Who does not know that phlegmonous inflammation is best treated by depletion, local or general, or both; and by the application of warmth and moisture, agents especially calculated to relax? We think this instance sufficient to upset the doctrine which makes inflammation consist in debility of vessels."-Med. Chir. Rev., October 1832, p. 414.

Is there not a change of opinion also as respects the velocity of the circulation in the inflamed part? We now learn from the the inflamed part? journal that it has always considered this as the true doctrine of inflammation, viz., weakened and dilated capillaries, consequently circulation actually slower in inflamed than in sound parts. Witness how the reviewer expresses himself in October 1832, p. 412. "An inflamed part, if formerly white, becomes more or less red, and, error which has occasioned immeasurable if previously red, it is rendered redder. This arises, of course, from the greater quantity of blood which is in it. But we must not stop here, venous blood and arterial differ in mer expressions of these sentiments, and colour, and, for precisely the same reason, inflammation the colour is vivid, not only because there is much arterial blood in the part, but also because that arterial blood is frequently renewed; in other words, because it is circulated with rapidity." I remain, Sir, authenticating my communication privately, your obedient servant,

Oct. 7th, 183

EASTERN MEDICAL ASSOCIATION.

To the Editor of THE LANCET.

Sir,-May I request that you will do me the favour to insert in your next LANCET & correction of an erroncous reference to myself in the report of the " Formation of an Eastern Provincial Medical Association" Bedingfield's speech I am called Dr. Rum. sey, and am said to be president of the Bucks Medical Association. I disclaim, however, both these honours, being only a general practitioner, and holding no office in the Bucks Medical Association, of which, nevertheless. I am a member and a sincere well-wisher.

The mistake doubtless arose from my having mentioned to Mr. Bedingfield that I am secretary to a committee appointed by the Provincial Medical and Surgical Association, held at Oxford in July last, for inays, "ahould teach us quivy into the present state of parochial research to the parochial attendance, &c. &c. In this capa-

city I shall be happy to receive all the in- the previous injury to have been the cause formation which my medical brothren in the country can afford me; and I take this opportunity of gladly thanking you for the zeal with which you have, both in your editorial and parliamentary capacity, advocated the cause of the country practitioners, in their opposition to the disgraceful proceed-ings of the Poor-Law Commissioners. I have the honour to be, Sir, your obedient servant.

H. W. RUMSEY.

Chesham, Bucks, Oct. 5, 1835.

WITHOUT EVIDENCE.

To the Editor of THE LANCE !.

ticulars of a coroner's inquest which lately took place in this neighbourhood, and to which I was summoned as the medical witness. I do so for the purpose of enabling you to decide whether my conduct was legal or not in refusing to open the body without possession of a written order from the coroner. If I had opened the body without such order, could I have successfully supported a ing been opened: "Died of inflammation of demand for remuneration in a court of law; and against whom? You would greatly oblige me by answering these questions, as I have to make my appearance at the Old Bailey on the trial of the husband of the deceased. The subject of remuneration to medical men at inquests, being now of peculiar interest to the profession, you are at liberty to insert the following in the next number of your valuable Journal.

A woman named Sarah Goodlad game of the Western General Dispensary on the little with an injury which she said she are received from falling on a pail. I examinate side (the part affected, and believed to the contract of t there was a fracture of one or two ribs. treated her accordingly. Juflammation of the lungs came on in two or three days afterwards, and in spite of the most active treatment she died on the 19th ult. An inquest was held on the body, as it had been reported that her husband had beaten her (indeed she stated to a neighbour that her husband had been the cause of the injury). This came out in evidence before the jury, and it was stated that he had thrown a loaf of bread at her. It seemed to me from this that there was sufficient evidence of injury inflicted by the husband to account for the fracture, but most of the jury did not think so. They had heard evidence respecting some slight accident which happened about a month before I saw her, and it would seem from their verdict, that they partly believed without remuneration. En

of the fracture. Three of the jurymen, however, were not quite convinced on this point, and I was asked if a post-mortem examination would make the matter any clearer. I said most undoubtedly it would. The coroner (Mr. Stirling) therefore asked me to open the body, which I told him I would immediately do if he would give me a written order by means of which I should obtain remuneration for the trouble. This he refused to do, saying that he never had done such a thing. His clerk (who really was the chief man on this occasion) then told the jury that there would be no difficulty about the matter, though I had refused REFUSAL TO OPEN A BODY AT AN INQUEST, to open the body, for he would write to a WITHOUT REMUNERATION. - VERDICT VESTIVINAN of the parish who would send one of the house-surgeons from the parish infirmary to do it.

The inquest was accordingly adjourned to the rext day at three o'clock, when the Sin,-I beg to transmit to you some par- jury met, and waited for some time for the evidence of the medical man who was to have opened the body; but it appeared on inquiry that the body had not even then been opened; neither did either of the infirmary medical officers attend the inquest. The patience of the jury being now exhausted, they made up their minds to deliver the following singular verdict, the body not harthe lungs, brought on by fractured ribs, but by what means the fracture was accasioned there is not sufficient eridence to prove!"

Now, Sir, if the public will allow verdicts to be passed in such a manner as this, they deserve to suffer from the consequences. It certainly was not a just request to require a professional man, whose time and knowledge were his property, and whose reputation as a witness was at stake, to make a post-mortem chamination, without the least renuncration, and perhaps with insult. My motive for refusing on this occasion to open the body, grose chiefly from the feeling, that by complying with the direction of the coroner, I should be doing injury to the profession through an injury done to myself. Besides, I object to be even a partial means of continuing the present unjust system. Whether I acted according to law I beg to be informed, and remain, Sir, your most obedient,

WILLIAM ROBINS, House Surg.

1.0

Western General Dispensary, New Road, October 1, 1835.

. The only question of Mr. Robins to which we need reply may be thus answercd:-He was not liable to the institu any proceeding at the any penalty, for refusion

THE SYSTEM OF LECTURING.

To the Editor of THE LANCET.

SIB.—The truth of the remarks in the leader of a recent number of your invaluable publication, on the impositions of the legture system, must be acknowledged by every one who has been compelled to doze over the wearisome and uninstructive discourses called lectures, which are paid for on compulsion, at such an exorbitant price. What intellect can master and retain the matter of six or eight of these lectures delivered in one day? Thanks, however, to the untiring exertions of The Lancer, the system is tottering.

For my own part I have often considered that the lectures which a student hears, obstruct, instead of assisting the student, in obtaining a knowledge of the mode of perberming operations, for instance; the directions for conducting them are generally conveyed in the most vague manner, or the student is intimidated and prevented from attempting them, by alarming statements of the difficulties to be encountered. I am not the advocate of rash attempts, but I dispute the propriety of frightening students from attempting operations of any kind that near hereafter fall into their hands, instead of fully instructing them in their performance. I fear that the alarmists bear in mind on these occasions the effect of fully informing embryo practitioners on those points which hospital teachers and operators take especially under their own care as "pure" surgeons. Let the lecturers say what they like in favour of the lecturing system, I am sure that the pupil, especially when he is out of the pale of their influence, and with calm and dispessionate mind looks back on the system, will feel and acknowledge the entire truth of the remarks which The Lancer has lately made on the subject. With an expression of matisfaction that you have drawn yet further attention to this system, and fully assured that when the system has been thoroughly purged, its insufficiency and unworthiness will be admitted by every one, I remain, Sir, your obedient servant,

Medicus.

Worcester, Sept. 29th, 1835.

MIDDLESEX HOSPITAL SCHOOL.

c. C. Bell, in his introductory address comming of this school, remarked that it before the first the firs

informed of the fact, han they enthusiastically came forward and supplied the funds necessary to institute a medical school in connexion with the hospital. Sir Charles spoke of his connexion with the London University, and stated that the Council had refused to allow him to lecture on particular parts of the subject, alleging that it would not be just to other lecturers that he should have the privilege of lecturing on a "higher" branch of the science. He had contended, however, and still contended, that there was no such thing as a "higher" branch of anatomy, all parts of it being equally high and important. He considered that it was a bad plan for the University to have a professor and a demonstrator of anatomy, and this he told the Council at the beginning. The pupils, he said, would be more intimate with the demonstrator than the professor, and would regard the latter as too great a personage to be troubled with questions on anatomical points. Consequently the professor would be of hardly any use to the pupils; he would be a mere form, a name. Anatomy was not to be learned without the constant presence of the teacher in the dissecting room, and he thought that the proper plan was for the teacher himself, the "professor" or the "demonstrator," whichever name they chose to give to the teacher, should put on the sleeves and apron, and demonstrate in the dissecting-room, as he (Sir Charles Bell) had done. Sir Charles spoke of the little influence he had possessed in the Council of the University, and said that everything he had proposed was rejected. Amongst other errors of the Council he placed the circumstance that the Council had wished to purchase a German museum of anatomy &c., at the price of 30,000/., a measure which he opposed,-the Council, after the proposal had postponed for a short time, finding that they had been about to bargain without Receive the money to pay for it. Sir Charles then spoke of his evidence before the Par-Baurentary Committee, and repeated his helief that knowledge was more rapidly acquired under disadvantages, and the mind more fully strengthened by having difficulties to overcome, than where the student had abundance of money to pay under the certificate system, and plenty of apparent facilities for acquiring knowledge. He cautioned pupils against expecting, under the existing system of medical government, to be rewarded according to their merits and industry. The greatest men, he said, had died poor, and some were even persecuted for their real eminence as scientific men, who having prosecuted their inquiries faither than the drones of the profession, had met with injuries instead of reward.

BLENHEIM-STREET SCHOOL.

THE lectures commenced at this establishment on the 1st of October, with an introductory address from Mr. King, the teacher of surgery. After examining the nature and intent of medical knowledge, and asserting its claim to be ranked as a science, Mr. King alluded to the importance of practical observation and strictly logical deduc-" If medical science," he observed, is founded so essentially on observation, docs it not tollow that the great requisite in the medical student, is a mind capable of careful, minute, and patient inquiry, and of sufficient logical power to draw correct inferences from the facts observed? The habit and, I may add, woral physiology and parthology, must be unable to detect the cause, and apply the remedies, of a very extensive variety of human suffering." Mr. King referred to the influence of public opinion upon the medical profession, and the change gradually made to render examinations for a diploma more complete. "In requiring the healing art. The legislature should also clastic in some parts and firmer in others; in the protection and encouragement they two inches in breadth; the general extend to those who devote themselves to of the tumour is hard give berless instances of meritorious men, disheartened by the little reward they find for with the acception of their ardnous and sometimes perilous exer- which is supposed to be

tions. Many a man has been heard to say, - Why should I toil; why labour through the long and dangerous researches of my avocation, to win the knowledge that does not allow me to live? Why penetrate the foulest adyta, why hang with idolatrous fascination over some mass of decomposision? Why make disease and all its loathsome characters the food of my soul, the friend and companion of my life, ave, the poetry and witchery of my most ardent enthusiasm, to pine neglected, unnoticed, and forgotten, while some ignorant charlatan is the object of popular favour and support?" Mr. King concluded by exhorting the pupils to be zealous and industrious. "It," said he, " we make ourselves well acquainted with medical science, we shall stand in the same relation to other classes of society, that and capacity of right and rapid reasoning is And can there be a higher science than that so necessary in the application of the rules which confers the power of preserving life of treatment to individual cases, that I and freeing it from disease? Can there be a would particularly insist on the necessity of nobler avocation than that of protecting cultivating logic and mental philosophy, and rescuing from pain and deterioration Without these no man can be a good practour follow men? I know of no greater intitimer. It is the misuse of evidence at the men? I know of no greater intitiner. It is the misuse of evidence at the bod-side as well as in the hall of justice, that is a fruitful cause of suffering. A medical man should be skilled in detecting the first passage as well as full full and advancement of that interest, fallacious reasoning as well as false facts, is second to none of his species. He stands Patients are apt to deceive both themselves upon the prondest eminence upon which a and their doctor. Errors are constantly man can stand; and commensurate with arising from the confounding of cause and his usefulness ought to be the respect paid effect, from confounding the symptoms, to his character. It is an eminence obtained which are effects, with the disease which is only by much labour, by long perseverance, the cause of them, and from attending to and through some danger; and proportionthe cause of them, and through some many only, instead of regarding the late to these should and shall be the reward having been sufficiently trained to admit of having been sufficiently trained to admit of the designing it. ST. GEORGE'S HOSPITAL.

INGUINAL HERNIA.

THOMAS WILLMAN, aged 25, was admitguarantees for the security of the public by ted into the hospital March 3rd, at 4 p.m., examinations which will test high qualities under the care of Mr. Walker. There is of mind, a thorough practical knowledge a tumour in the groin in the usual situa-should be indispensable for the exercise of tion of inguinal hernia, of an eval shape; imitate the governments of other countries about three and a half inches in length and conti of it if ofter,

scrotum. The pain of the tumour is not in the morning. He feels easier. very severe, even when roughly handled. He states that he has always had a small tumour in the groin, and which he supposed was the testis. About three months since, whilst riding on horseback, he was thrown with some degree of force against low; pulse soft; less tenderness; no pain; the pommel of the saddle; this was followed by the appearance of a tumour in the groin (of nearly the same size that it is at present), which, however, subsided upon his lving down in the horizontal position, and this tumour did not return until about four days since, when, after using some free from pain, except when firm pressure undue exertion, it suddenly reappeared, and he has not been able to remove or reduce it since. He has taken several doses of aperient medicine, which have rather tended to aggravate the pain than otherwise. The swelling has not diminished, and he was bled (without effect) to two pints

before his admission. There has been constant sickness since yesterday morning, and no alvine evacuation for the last three days; pain and tenderness over the whole abdominal region, and a dragging sensation about the unbilicus. Pulse 100, small and weak; skiu hot; tongue furred. On his admission he was put into the warm-bath, which produced syncope, and attempts were made by the taxis to reduce the swelling, but without effect. Ether was applied over the tumour, ! but no benefit resulted; the sickness and hiccup increased, the pulse rose, and the abdominal tenderness greatly increased.

Under these circumstances Mr. WALKER determined upon operating immediately. On laying open the sac a mass of dark thickened omentum, with a narrow nock. was exposed; beneath this was a small knuckle of strangulated intestine, and to the outside of all, the testes and spidldymis were seen. Some little difficulty was experienced in dividing the stricture, from the chord lying in the way; this, however, was removed, the stricture was divided, and the intestine returned easily. A ligature was placed around the neck of the mass of omentum, which was then cut off, a pledget of lint was introduced into the wound, and sutures, strapping, and compresses, were applied.

10 p.m. He has had no sickness since the operation; pain in the abdomen less; but considerable tenderness remains; pulse 108.

Sedative Solution of Opium 111 xx; Spirits of Nitric Ether 3ij; Soluof Acetate of Ammonia 338; when Misture 31; to be taken tor-Oil injection to advery six hours els tre epen.

which he says has never descended into the times during the night, and he slept a little The abdomen somewhat full, but less tenderness present; pulse 110, sharp and compressible; skin cool. Mutton broth for diet.

8 p.m. The howels have been relieved several times during the day; spirits rather tongue less coated.

R Aromatic Confection gr. xv; Tineture of Henbane Mxv; Camphor Mature 3iss; every six hours.

5. He has passed a very good night, and is is made upon the abdomen. The tongue is cleaner and moister. The skin cool, pulse 80, and soft. The bowels have not acted since yesterday afternoon.

Towards the evening he complained of some pain on the left side of the abdomen, which was increased by pressure. The skin is hotter; tongue whiter; pulse 80, and sharp. The abdomen is distended, and the bowels have not acted for twenty-four hours. Twelve leeches to be applied to the abdomen.

- R. Carbonate of Potash 10 grs.; Sulphate of Magnesia 1 drachin; Sirup of Poppies 1 drachm; Distilled Water 10 drachms. The draught to be taken every six hours.
- 6. He did not sleep much until this morning; there is less pain and abdominal tenderness, but some little irritation about the wound. The tougue is cleaner; pulse softer, 84, and jerking.
- 7. He is quite free from pain; skin cool; tongue moist; pulse 80, and soft. dressings were removed for the first time since the operation; the upper half of the wound was found to be united by the first intention, and there was a little pus in the lower part of it.

 B. He continues quite free from pain, and

is doing very well in every respect.

10. He is doing very well. The wound has nearly healed, except at the lower part, where the ligature comes through, which is attached to the omentum. Mr. WALKER endeavoured to remove it, but failed. bowels have generally acted twice in the twenty-four hours. Repeat the draught every six hours.

16. He has continued steadily improving since the last report; the wound has been dressed every day, but the ligature had not separated in the least until to-day, when it came away very easily in the dressings. The only part of the wound now open is that through which the ligature came.

21. The wound is quite healed.

26. A truss with a circular pad in the centre to admit the testis was applied, and keeps up the hernia extremely well. He have been relieved seven was then discharged quite well.

SCLERBTITIS.

James Slight, zetat. 41, was admitted on the 28th of March, under the care of Mr. WALKER. From the facts which could be gathered in connexion with the previous history of the case, it appeared that on the 10th of the month, whilst employed in cutting wood, a chip flew into the right eye: severe pain ensued, which lasted for two days, at the end of which time he went to a surgeon, who ordered him a lotion for the eye. This did not abate the pain and suffering. On the 24th there were great rest lessness and great heat of the skin, with increased pain in the eye, and a copious watery discharge.

On his admission into the hospital, the sclerotic coat was highly vascular, and its minute vessels were extensively injected; the cornea was less transparent than natural, and a minute ulcer could be perceived in the onter and middle part of it, into which, in consequence of its convexity, the iris appeared to protrude slightly. Around this alcer could be seen a thin nebulous line of about one line and a half in breadth. There was great intolerance of light, with pain over the right rance of light, with pain over the right temporal region. His general health has always been good, and is not disturbed at present. Tongue clean; howels not open; bulse 64, full and soft; skin cool; sight of WALKER, under whose care he was always to the soft of the soft

March 29. Eye very painful during the night. A saturnine lotion to be applied to the eye.

30. Twelve leeches to be applied to the

April 1. To be cupped on the nape of the neck to twelve onnces. A 3ij Senna draught to be taken directly, and repeated in two hours, if necessary.

3. Continue the medicines.

4. There is still much remaining inflammation of the sclerotic, and much intolerance of light. The cornea is not more nebulous than before. The pupil is not quite circular, the external edge being depressed, as though the iris had become slightly detached from the ciliary ligament. At the inferior edge of the pupil there is seen a prominent opake surface resembling lymph, which extends nearly to the inner surface of the cornes. Pulse is natural; skin hot; thirst and headache. Continue THOMSON. An L the medicines; omit the lotion.

the man can see very well; the sclerotic to which act she

and conjunctival coats are much less injected than at the last report. The iris appears in its natural state. The pupil is small but regular in its outline. The cornea isquite clear, and at the inferior border of the pupil in the anterior chamber there is seen an opake body, which is the capsule of the lens. There is no pain in the head; he sleens well, and the appetite is good. Continue the medicines.

16. The capsule of the lens is now seen to be adherent to the inner surface of the cornea, occupying a small portion of its central and inferior surface, and the inferior portion of the iris is, in consequence, drawn forwards. The lens appears rather opake. There is not so much sight in the eye as before. There is still a circular zone of the bloodvessels to be seen around the lower edge of the cornea. He complains of no headache or intolerance of light. The general health is improving. The appetite is

Phonmer's Pill gr. v every night at hedtime. Half a pint of the Alkoline Infusion of Sarsaparilla to be taken daily. Ordinary diet.

- mitted, passed a needle behind the iris into the posterior chamber of the eye, with the intention of depressing the capsule of the lens, which had become dissolved morning; eight leeches to be ap- in the aqueous humour by the rupture of plied behind the right temple; a the capsule at the time of the accident, and it was by this means removed as much as possible out of the immediate sphere of vision.
 - R. Saline Draught 3iss; Solution of Tartarized Antimony mxv; Sulphate of Magnesia 3i; every six hours. Twelve lecches to the right temple.

May 13. He is very much improved, and can see distinctly with the eye; there is neither pain nor intolerance of light; the pupil is still small, and is slightly opake; general health good. Continue the medi-cines. Ordinary diet.

18. Discharged cured.

ST. BARTHOLOMEW'S HOSPITAL.

MR. STANLEY'S INTRODUCTORY LECTURE.

Ma. STANLEY delivered an introductory lecture to his sessional course of anatomical used to assemble in the theatre of this hosconstituents of the human body, in order, as he said, to secure the attention of his audimedicine. With much novelty he adverted to the skeleton as the basis upon which the soft parts were constructed; the cranium, by its arched and conical configuration, affording a beautiful protection to the delicate brain; the ribs forming an important sustaining the weight of the body, and holdthe foot, by its arches, admirably did the duty of a foot—the whole skietchin january trations of every valuable discovery that WOUND OF THE INTESTINES FROM EXTERof a foot-the whole skeleton yielding illus-He referred to a section of the femur, to show the difference between external and necrosis of the long bones. Nitrate of silver afforded another confirmation of this fact. The subject of feetal gradation was handled with no less ability and originality. The fortus, it was observed, in its progressive gradations, bore a close analogy to the gradation upwards of various lectures, on the first of October, to an species of animals. As to the variations audience not quite so large as that which from natural appearances which occasionally arise, these with singular ingenuity pital. He commenced with a sketch of the were said to arise from an interruption in development, as in the hare-lip. Mr. STAN-LEY concluded by enforcing the absolute tors, and in consequence of the intimate necessity of studying surgery thoroughly, connexion of the subject with the study of in order to understand it thoroughly, the utmost diligence and enthusiasm of students being necessary under the existing system of instruction, which Mr. STANLEY said nothing to depreciate. No hiatus in fact, he added, should exist in his (the lectu-rer's) assiduity to impart information, and enclosure for the thoracic organs; the pelvis he doubted not that his efforts would be successfully repaid by the unremitting ating structures of vast consequence; while tention of such a class as he might have the honour of obtaining.

NAL INTERS.

JOSEPH SHAW, at. 17, was admitted into internal osseous structure. The powers Harley's ward, St. Bartholomew's Hospital, thatacted on the bones, namely the muscles. were, he observed, exceedingly interesting EARLE, with an injury in a situation mid-to the student. Their force was actually way between the crists of the illian and the astounding Dr. Young computed muscular false ribs on the right side, inflicted by the power to be equivalent to five hundred shaft of a cart thrusting him in contact pounds on each square inch of its acting with the wall. He complained on admissubstance. The celerity of motion of the sion of severe vomiting and faintness; the muscles was no less remarkable. Haller urine exhibited a bloody tinge; there was asserted that he could articulate fitteen hundred letters in a minute. Immensely im- cality of the mischief, with a central depres-portant also was the nervous system, so in- sion. Mr. EARLE considered, from the seat timately concerned as it was with the reaof the brighty, that the kidney or color might
soning faculties. The senses were really all have been involved, but he was more independent on the nervous system. Yes, clined to ascribe it to the former, on account

The human eye differed plied, and he was cupped on the loins. The from that of the brute by indicating intel-central depression having become more evilectual feeling, whereas in the latter its dent, Mr. Earne was led to form an oninion expression merely denoted a desire to that the abdominal muscles in that situation gratify appetite. Physiologists have ob- had undergone rapture, and that a portion served that in proportion as one sense is of intestine had thereby become protruded; impaired, the remaining senses increase in the latter part of his prognosis was further acuteness. A blind man, for instance, has confirmed by a gurgling sensation commuascertained his proximity to objects by nicated on the application of the hand, and the reverberation of the air on his ear. The by the swelling receding under pressure; vascular and absorbent systems were next from this view of the case he entertained an reviewed, in an equally new and striking idea of employing a truss, but was exceed-manner, as means of reparation, especially ingly surprised, after a lapse of two or three in the osseous reproductions that succeed days, to hear that an abscess had formed, iss

salvation was purely dependent on the in-jury not implicating the cavity of the abdo-interesting, incommend it exhibits a provimen, commonly so called; the ruptured in- dent effort on the parts of nature to repair testine being uncovered by the serous inrestment, precluded the extravasation of feces into the peritoneal sac, which (had it occarred) must inevitably have been at-tended by fatal results. Mr. EARLE observed that there were many exceedingly interesting details to be found in the Memore of the French Academy, where sharp instruments, such as swords, had perforated the intestine, and nothing unfavourable had resulted. This Mr. EARLE considered very probable, especially when the intestine was in an unloaded state, and where no effusion had supervened; but the case differed widely in which the intestine had been actually ruptured from severe injury. The course of treatment that had here been adopted was to dilate the openings to permit of a freer egress of purulent and feculent matter; this procedure it was thought there would be a necessity to repeat; the lower bowel was daily relieved of its contents by means of a clyster, with a view, as it were, to invite the feces to their natural outlet; this plan had been so far successful that although some excrement passed through the aperture, yet a considerable quantity had already resumed an ordinary route. The ensemble of the patient seems to augur favourably.

ANEURYSM OF THE SUBCLAVIAN ARTERY.

A case presents itself in Darker's ward which is well worthy the attention of medical practitioners and students. The subject is a man whose name is Joseph Webb, at. 42, who was admitted into the hospital on fact, the bones were literally denuded of the 24th of August with a large aneurysmal tumour projecting from beneath the right clavicle, and extending outwards; its mag-uitude approximated to that of a child's head, and it was adjudged by Mr. LLOYD, under whose care he was admitted, to be an anenrysm of the subclavian artery. At some little period from his admission a day was appointed for performing an operation (that of tying the subclavian artery); but its postpon-ment was announced at the expletory measures have been resorted to with favourable results. Digitalis has been used has been employed, and its employment repeated; the strictest quietude has been enjoined; and under this pallistive mode of treatment the patient has manifested proprovement; his aspect has be-

organic lesions, when aided by the employ-ment of remedial treatment. The foregoing report was taken on the 27th Sept. 1835.

AMPUTATION BELOW THE KNEE .- Thomas Trott, æt. 58, a waterman at a coachstand, was admitted on the 21th of June with a severe injury of the right leg, consequent on ejection from a cab, the wheel having passed over the inferior portion of the limb, on the internal surface of which there appeared a slight ulceration, to which succeeded crysipelas of the entire member. Leeches, and saline medicines, with tartar cinctic, and other means calculated for the preservation of the limb, were employed in vain, and amputation was decined absolutely necessary, the operation being performed on Tuesday the 25th of August. Previous to the operation some doubts were entertained as to whether fracture really existed in the vicinity of the ankle joint. Mr. Earle commenced the flap amputation six inches below the knee-joint; the flap was then completed, and the catling was used to divide the muscles and interesseous ligaments, the sharp upper ridge of the tibia being sawed off previous to the divi-sion of the bones. The rest of the operation was conducted in the ordinary manner. An claborate dissection of the diseased joint was afterwards made, but not the slightest evidence of fracture was discovered. All the cartilages covering the tarsal bones had undergone absorption; in cartilage, a circumstance which, in the opinion of the surgeons present, resulted from inflammation consequent on the injury, the constitution of the patient being a bad one.

HYDROCELE.-Mr. STANLEY performed the operation for hydrocele on a man who had suffered under the affection for three months. The quantity of fluid evacuated was considerable. The injection used was a in consequence of circumstances occurring mixture of port-wine and water, but Mr. connected with the patient's general health, STANLEY observed that he had known instances where the re-injection of the evacupected period of performance. General de- ated fluid, or even the introduction of pure water, had been attended with eminent suc-cess. The most unexceptionable and defibut for a very limited period; venesection nite form of injection, however, consisted in a solution of the sulphate of zinc, a drachm to a pint. The nature and quantity of the fluid injected were immaterial considerations; but it was of paramount importance that the injection should be brought serful; the size of the tumour into innuediate contact with the morbidly ble diminution, and secreting surface, the time of its retention evenience, except | varying with the peculiarity of the case, the production of a certain amount of irritation of a certain amount of irritation that no farther idea of openindicated by a certain amount of pain. In

the present case secould be judicious to the right lung allows the entrance of less with a view to the per somewhat sibilus. Better; but slight permeation through first, to avoid puncturing the testis; and, the right lung. secondly, to select carefully the part for the introduction of the trocar instrument, obviate the liability of wounding one of the large veins traversing the scrotum, as in ingression. the event of such an accident the blood would become effused into the scrotum, and what was at first a hydrocele would then be converted into a hæmatocele.

Acute BRONCHITIS .- Patrick Thornton, ætat. 30, was admitted into Matthew's ward, on Tuesday the 21st of July. On the day of admission the following were the symptoms :- Countenance dusky ; lips parched ; the temperature of the surface augmented; no cuticular transndation; pulse 124, and compressible; tongue covered with a thick tion, and lies on his back; the alvine excretions are daily induced by medicine; anorexia and much nausea; the urine high-coloured and scanty; no cephalic pain; perfect absence from abdominal tenderness; sleep considerably perturbed. A small quantity of blood was this morning ejected from the mouth; the expectoration has a frothy and a streaky aspect. He had enjoyed tolerably good health previous to last Friday, when, after dinner, he was suddenly seized with a pain in the chest, accompanied by difficult respiration; his skin then became hot and his bowels constricted. He applied to the parish surgeon, who prescribed some purgatives, and a sinapism to the chest. Auscultation ascertains more air to enter the left lung than the right; crepitation mingled with sibilus and ronchus is evident in both lungs, anteriorly and posteriorly, but more especially in the left lung, as this admits of more permeation than the right. Ordered twenty leeches and an emetic; and calomel with James's powder every second hour.

22. Four ounces of buffy blood were taken from the aim by venesection, half an hour after which the ingress of air into the right lung was more free, the pulse quickened, and the respiration was easier. Cupping to four ounces beneath the right scapula; a blister;

a grain of calomel every hour.

23. Thoracic pain entirely gone, and the patient in all respects better. Some sibilus still audible. The medicines to be discon- introductory remarks

tinued.

24. Lips more livid; ronchus and sibilus has given on a second the left lung admits less air than yesterday; them the authority of a national second livid lung admits less air than yesterday;

permit the patient to the patient to the ward air in front than the left, in which often with a view to the occurrence of the crepitation is mixed with rouchus and

the right lung.

27. No pain on effecting a deep inspira-tion pulse computes 120. Little air caters in left lung; the right permits of a liberal

28. An increased quantity of air permeates the left lung, accompanied by ronchus. Ordered the Hydraryyrum cum Creta.

A free passage of air 29. Mending. through both lungs, together with ronchus. Administer the Effervescent Draught.

August 3rd. Sibilus is still to be discerned in both lungs, especially at the inferior pos-terior portion. Patient says he feels quite

well.

10. Crenitation is audible over the whole posterior division of the left hug during inspiration, and likewise beneath the clavicle; white fur and rather dry. He complains of in which last situation he complains of pain a short cough attended by great pain, ex- on a deep inspiration, coughing, or lying on tending from the third to the sixth rib of the his side. THE

RESPIRATORY APPARATUS IN OLD PERSONS.

THE Archives Generales for August contains an article entitled "Clinical Researches into the Diseases of Old People, conducted at the Hospital of Salpetricre, Paris; by M.M. HOWMANN and M. DECAMBRE, internes."

THE diseases peculiar to persons advanced in life have hitherto been sketched in a very slight manner by a few authors, rather than examined with that degree of care which they really demand. It would seem as if physicians thought the lamp of life at this period was too feeble to require any fostering attention, and that all that was necessary to be done was to allow it to burn out quietly without any attempt being made to prolong an existence, which, in the order of things, must very soon arrive at its termination. We do not want for treatises on the diseases of the infant state, or childhood: the maladies of adults have given rise to works without number, but we possess little clear knowledge, either on the modifications impressed by age on the texture of our organs, or on the functions connected with them.

The object of the authors of the memoir new before us is to supply this deficiency, and they commence with diseases of the respiratory organs, which, though frequently the constant of the co

triere, whose ages vary from 60 up to 90, or beyond 90 years.

Let us first notice a few anatomical circumstances peculiar to the respiratory apparatus of old women.

Thorax.—The thorax in aged females presents two states, very different from one another, which deserve to be examined.

The first is a case of exception, and found in aged females who conserve a considerable share of the freshness of youth; the mammæ are voluminous and still consistent; the whole thorax is covered with a layer of fat; the muscles are well-coloured, and the costal cartilizes retain their suppleness. However, the ensemble of the thorax has undergone a peculiar change belonging to old age; the superior part is flattened laterally in such a way that the antero-posterior diameter is considerably increased at the expense of the transverse one. This change is commonly accompanied by a gradual enlargement of the thorax towards the inferior part, which then represents a pyramid with a large base, whose apex has been somewhat shortened.

The second type is much more frequent. Here the cavity of the thorax is remarkably modified, and the lateral flattening above noticed may be carried to an extreme degree; in some cases it produces an angular form of the thorax, exactly like that seen in rachitic persons. This disposition of the chest is important to study, for it brings with it several changes in the relation and conformation of the subjacent viscera, which have not as yet been noticed by writers. Thus the liver is considerably pushed down from its natural position, and frequently bears the marks of pressure exercised on it by a narrowing of the inferior portion of the thorax, in females who have worn stays. In these cases also, the right lung is clongated, and follows the displacement of the liver into the abdominal cavity. The sternum is, as we mentioned, always carried forwards, but

H

the xyphoid cartilage of pushed backwards, some cases even constitutes the posterior and even sometimes completely concealed behind the cartilages of the last true ribs. The Hence a pneumony of the summit may longitudinal diameter of the thorax also undergoes a remarkable change in old persons. This circumstance has been noticed by all writers. Sometimes the intervertebral cartilages disappear completely. Fischer* re-lates one case of a man aged 100, in whom nine vertebræ were reduced to one solid piece, and Boerhaave + mct a similar alter-

ation affecting the whole spine.

The vertebral column however is not only shortened, but becomes flexed forwards, and that often in a permanent manner. In consequence of the weakness of the dorsal muscles, the pressure is most felt anteriorly, and here the bodies of the vertebræ are most intimately united. This inflexion usually occupies the last cervical and first dorsal vertebræ, and is often carried to an extreme degree; in some of the old women at Salpetriere it is so marked, that the posterior surface of the scapula becomes superior, and the cervical region makes nearly a right angle with the dorsal. The changes just pointed out in the external form of the thorax, must necessarily occasion correwithin its cavity, or connected with it. The diaphragm is thrown into folds, which in some cases leave their mark on the liver, and this viscus is pushed down into the cavity of the abdomen several inches below its natural level; the tissue of the ribs thomselves is much rarefied, but (contrary to the asser-tion of authors) in a very few cases only do we find an osseous incrustation of the cartilage of the ribs. The costo-vertebral cartilages generally conserve their mobility to the most advanced period of life.

Lungs. - Before we pass to the pathological examination of an organ, we should possess; corect notions of its structure at the period to which our examination is limited, for the former cannot fail to receive special characimportance to study the structure and peculiarities of the pulmonary tissue in old per-With respect to their external configuration and appearance, the lungs of old persons may be ranged under three classes.

In the first, the lungs preserve nearly their normal aspect, and differ very little from those of the adult; however, in all cases where the chest presented a lateral flattenng to any considerable degree, the authors vascular apparatus is less numerous; the found a peculiar disposition of the interlobulur fissure. This becomes vertical, in such a way that the two lobes of the left lung are opposed to each other, one directly forwards, the other backwards; while in the right lung, the middle lobe, directed downwards, is surmounted by the inferior lobe, which in

sently have occasion to see.

in the second class, the peculiarity consists in the smallness of the lungs. organ is light, and little susceptible of being infasted by the greatest force. They are constantly bathed in the cavity of the chest by a limpid serosity; when compressed, their crepitation is more diffuse than in the lung of the adult.

In the third class the lungs present a mass unequally thrown up into eminences, and are bathed in a much greater quantity of finid; they are flaccid, livid, and have altogether lost their conical form. The division of the lobes is not less remarkable; the latter are merely united by a flat, thin pedicle, which leaves them as it were floating in the thorax; they are extremely light, and give a most peculiar sensation to the touch; the heart is smaller, and often in a state of complete anemia; the thorax is excessively emaciated.

Intimate Structure .- M. Magendie, who has made some interesting researches on the structure of the lungs in old people, lays it sponding alterations in the viscora contained down as a fundamental rule, that the air-cells are increased in magnitude, giving rise to a considerable diminution of their specific gravity. However, the exaggeration of the cellular structure is only perfectly seen in those persons who present the traces of old age in a very high degree. The lungs of aged persons were examined by our authors nearly in the same manner as by M. Magendie, but they had not recourse to insuffla-tion. They arrange the lungs, considered as to structure, under the three classes above enumerated, viz.

1st. Case. "Lungs voluminous, filling a thorax well developed, and whose soft parts are still free from emaciation, or even fat." A thin cut of this lung dried gives a number of holes perfectly round, crowded together ters from the latter. Hence it is of great like the meshes of lace, and presenting a diameter of about a quarter of a line. (Fig. 3.) The cells are here perfectly regular, and everywhere independent.

2nd Class. "Lungs of regular form, but small, bathed in scrosity; thorax contracted; soft parts emaciated." A thin cut of this lung dried, shows a texture somewhat similar, but differing in many respects. The cells are no longer round but elliptical, and the cells, however, are still limited by a regular circumference, and are independent. (Fig.4.)

3rd Class. " Irregular form of lung, which is withered-looking, and applied to tebral column ; the thorax is con reduced to an extreme Here the pulmons any distinct form verted into # sort of s croscope distinguishes a

occupy the inferior lobe, as we shall pre-

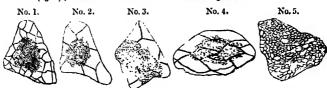

Tractatus de Senjo ejusque Gralibus et Morbis † Prælect, tom, ili. p. 725,

ches, and there is no trace of the lobular subdivision. This latter condition of the lung, which is always found in persons presenting the characters of old age in a well-marked form, is a species of natural emphysisms, which is well worthy of attention, but his necessary not to confound it with marbid lesions, properly so called.

If we compare the relative size of the pursonary cellules in the infant, the adult, persons; in a second and the aged person, we shall find a remark-able progression as we approach senility. This has been proved by the author, in frequent experiments. Thus the dried cells of the infant lung are only a twelfth of a line in diameter (fig. 1); those of the adult about and interesting facts.

one-eighth or one-sath (fig. 2); finally, the dimeter of the air-cell fin the aged (fig. 3), presents a diameter of one-fourth of a line. Hence the law first pointed out by M. Magendle, that the pulmonary tissue becomes rarefied directly in proportion to age.

Such is a brief anatomical history of the structure of the thorax and lungs in aged persons; in a second memoir the authors propose to take up the physiological part, and treat "on respiration in old patients." We shall not fail to follow their observations, which promise to bring to light several new and interesting facts.

Explanation of the Engravings.—The aircells may be supposed to occupy the entire surface of each layer.

No. 1. Layer of the lung of a child four years of age.

No. 2. Layer of the lung of an adult female.

No. 3. Layer of the lung of an old female and fusion of the cells.

(first type). Commencement of rarefaction in the lungs; cells round, but quite independent.

No. 4. Layer of the lung of an old female (second type). Second degree of rarefaction; cells elliptical, but still independent.

No. 5. Layer of the lung (third type). Extreme degree of rarefaction. Irregularity and fusion of the cells.

REFLECTIONS ON

INFANTILE REMITTENT FEVER.

By JOHN ALEXANDER, M.D., Manchester.

(Continued from page 411.)

Case 2. May 21st, 1832 .- Thomas Wood, ætat. 4, from Queen-street, admitted a homepatient of the General Dispensary for Children, presents the following symptoms:-Extreme emaciation with a rough dry skin; tickling cough, with little or no expectoration; tumid abdomen, with bowels irregular, though generally constipated; total loss of appetite; much thirst; great irritability; constantly picking at his lips, nostrils, or other parts of his face ; cervical glands enlarged; tongue reddish and dry; pulse 120. The boys spinal column presents a double the scapular and dorsal rehim to have been have taken worm in an sening, with carional delirium during

I have directed a domestic enema immediately; four grains of Dover's powder, with three of calomel at bed-time; and the tincture of iodine in camphor mixture during the day.

23. The enema was followed by one dejection, tolerably copious, of clayish-coloured scybala; but the bowels have not since been moved. The boy has had two very restless nights and an increase of delirium; his ancices are to-day observed to be swollen; pulse 140, and very weak. He refuses his mixture and all food, is unwilling to answer any question, and is obviously sinking. Recommended an occasional repetition of the enema, and the application of a blister to the nape of the neck.

25. Child died last night; permission to inspect obtained.

Sectio Cadaveris.—Body most strikingly emaciated, with the exception of the tamid abdomen. Skin of a dry, shrivelled, yellowish appearance.

Chest.—About an ounce of serous fluid between the pleurs, with slight adhesions, apparently recent, on the left side. The lungs here and there studded with groups of phaseles some in a softened, but most of them in a hard the root of a child, and reputed insensibility (com-of one of the left pulsarity lobest a small paratively speaking) of the liver, are perhaps vomica containing scarcely half an orange of best accounted for by reference to the spepurulent fluid.

Abdomen .- Great distention ; liver siderably enlarged, of a darkish hat,

usual. quent to find in those who have died from the slightest exertion." infantile remittent fever, clusters of tuli-ra very natural opinion amongst pathologists, that a strumous diathesis is the most frequent remote cause of infantile remittent fever, as it assuredly is of tubercular

phthisis. It will also be remarked, that the liver was found enlarged, of a darker colour than usual, and exceedingly lacerable. Reflecting on the general symptoms of the disease under consideration, it would by "a priori reasoning be natural to expect, that more or less affection of that important viscus would present itself on autopsy. And, this is the case; for in the majority of fatal cases of this malady, when an inspection was not declined, alterations in size, colour, or structure, have almost invariably been observed by the present writer; and, on that observation, he has naturally been led to found his high opinion of the remedial influence of mercury in the complaint.

It is scarcely two months ago since I inspected (with the assistance of Mr. Walker, a scientific surgeon of this town) a boy about nine years of age, who had gradually sunk under infantile remittent fever in its most chronic form. After observing the ordinary appearances consequent upon the complaint, we were somewhat surprised to find the whole distal portion of the right lobe of the liver converted into a rac containing several ounces of purulent matter, and the parenchyme of that viscus quite lacerable: two evidences of advanced hepatic disease, which, considering the simple habits cific strumous virus above alluded to.

CASE 3 .- June 13th, 1835. Master Aunusually lacerable. The mescuteric glands atamine, residing at Astley, near Leigh, are more than double their usual size; some broughs to Manchester this day by Mr. of them contain a cheesy sort of fluid, whilst Newton, an intelligent practitioner of the others appear to be filled with pus. There former place, who states as follows:—The is no evidence apparently of recent inflam- boy has been delicate from infancy, but mation in them; intestines much filled with more particularly of late has been losing air, not offensive on evolution; and contain- flesh in a marked manner. ... has been, ing, in the colon particularly, a considerable on one or two occasions, treated for worms, quantity of the same scybalous whitish feees but has never been known to part with any, ejected during life. In the ileum, on its or to benefit by verminative remedies. His mucous lining, are observed several small nights are very indifferent; he has great ulcerative patches about the size of a six- thirst, little appetite, no action of the pence. The other abdominal viscera appear bowels without medicine. On examination tolerably healthy; the peritoneal envelope I find the boy extremely emaciated; his considered thicker and more opake than countenance pallid, with dark areola around the ever; tongue whitish, with red clon-Remarks .- From the appearances noted gated papilla, numerously prominent; abwithin the thorax, this boy had evidently domen hard and tunid; pulse 118. Mr. laboured, previous to my seeing him, under Newton adds "that there is a febrile exaceramore or less severe attack of pleuritis, bation each evening with succeeding mornconjoined with some tubercular inflamma- ing chilliness, and has been for some weeks, tion. It is, however, anything but infre- and that the boy is indisposed to any, even

We have directed him to have a warmcles under various conditions in the pul- bath on reaching home; ferrum tartarizamonary parenchyma; and hence has arisen, turn with soda at bed-time, and easter oil each morning; his diet a milk one.

19. Mr. Newton writes, "I regret to inform you our little patient is much worse. the symptoms being considerably aggravated. On visiting him this evening I observed as follows :-- Pulse quick and weak; tongue rather red at the tip and edges, and coated at the centre and back part with a white for; bowels still irregular, and feees scybalous; urine high-coloared, but in fair quantity; thirst still great, and no appetite; skin moist; he refuses his medicine; is much reduced." The child's father adds, "that, in consequence of a pain suddenly arising in the boy's howels yesterday, four leeches had been applied, and a domestic enema used."

20. Visited Master A. this day, in consultation with Mr. Newton of Astley, and Mr. Pendlebury of Leigh. The abdominal pain has been mitigated by the leeches, but is still complained of, aggravated on pressure; the hoy's general appearance very unfavourable, from sallowness of complexion and great emaciation; pulse 112, weak; urine scanty and high-coloured; appetite none; thirst very great; tongue coated but moist; the bowels very much relieved by copious dejections of clay-colours after the enema of yesterda previous :-

Applic. Respect. Repet. Enema domestic Habt, gr. x. Hyd. c. C. 26. "The abdominal uneasiness," writes Mr. Newton, "was much relieved by the blister, and little or no pain is now complained of on pressure. The bowels cos tinue very inactive, and the character of the evacuations unchanged. The tongue how ever is cleaner and moist. I attempte addition of a little ipecacuanha to the witen. ing powder, as we had agreed upon, but its nameous taste prevented the hoy's taking it. His pulse is somewhat reduced in frequency." Desired to continue the treat-

July 10. The child improving. Bowels still torpid, but the motions tinged with bile. A little appetite, less thirst, and able to sit up in bed. Recommended an addition of a 69, Fenchurch-street, single grain of calomel to the evening powder, the latter and enemata being persevered in.

24. Much improved; abdomen lessened and soft; strength returning and fever colony. Directed to have small doses of the sulphate of magnesia rendered palatable by nitric acid.

vourably.

25. Convalescent.

difications of diet were tried, such as stewed previously. Again; this boy took, as may possibly be remarked, an extremely large quantity of incremial medicine, upwards of three hundred grains of the hydrargyrum cum creta, independent of the calomel, and yet no perceptible affection of the salivary glands was induced by it! It has indeed, in several examples of infantile remittent fever, and in a few cases of acute rheumatic fever, been matter of surprise to the writer, how little the mouth has seemed to be affected by this useful mineral; whilst, in some other diseases, the reverse condition cannot have escaped remark : for example, during the decline of measles, wherein I thewn the exhibition of a couple of of calomel, followed by concal to the health of on of the pracAPOPLEXY.

the Editor of THE LANCET.

SIR,-The following case of pulmonary apoplexy happened in my practice at the City Dispensary; it presents some symptoms of very rare occurrence, which you may probably deem worthy of record in I am, Sir, your useful Journal.

Your obedient servant, R. ROWLAND, M.D.

Oct. 12, 1835.

CASE .- Sept. 21, 1835. Thomas Holloway, aged 50, a porter, had been subject to gone; stools still figured, but of tolerable cough and dysping for several years, but he was able to work at his business until about two years ago, when the "shortness Aug. 15. Our patient progressing fa-, of breath" obliged him to discontinue all active employment. In general the cough and expectoration were trifling, but they Remarks. - In the above case several mo- were frequently increased from slight causes.

About a week ago, after exposure to wet primes, outnieal with treacle, ripe fruit, and cold, he was attacked with an aggravabuttermilk, &c., with a view to induce tion of all his symptoms; the cough became liquid evacuations; but the bowels, al- severe, the dyspnou urgent, and the expecthough so supplied and daily stimulated by toration copious, but without any admixture enemata, continued torpid, and the feces of blood. The respiration was inaudible figured, up to the period of convalescence; a over the right lung, and was bronchial, with circumstance somewhat unusual, consider- sibilant and mucous rale over the left; the ing the dejections had in a great measure heart's action could be readily distinguished recovered their bilions hue for some time over the whole anterior portion of the chest. On Thursday, the 17th of September, I received a hasty summons to visit him. During the previous night he had vomited an enormous quantity of blood, some of which was coagulated. I found him lying on his back; the pulse was quick, jerking, and wiry; the respiration exceedingly laborious; the countenance anxious, and of a leaden colour. He answered questions coherently, and chiefly complained of difficulty of breathing. On the following day he rallied a little; the sputa were still bloody. and mixed with mucus, but the blood had not appeared in large quantities. He remained nearly in the same state on Saturday and Sunday. On the latter day the patient called my attention to a pulsating movement of the veins in the back of the right hand, which I also observed, although less distinctly, in those of the left. This symptom was more remarkable after each expiration, when the veins became elevated, but a very evident quivering pulsation occurred also during inspiration. Neither of these movements was synchronous with the arterial

MR. BUCKLAND'S EXHIBITION OF IRON.

pulse. When the veld was pressed, the pulsation ceased below the part where it was employed, but continued in the portion of the vein nearest to the heart; the jugular veins were prominent, but no paleation could be observed in them. Early on the day morning the bleeding returned, and the

patient almost instantly expired.

Sectio Cadaveris .- Monday evening. The right lung adhered firmly to the ribs, and could not be separated without laceration. It was thickly studded with tubercles. And excavation of about the size of a hazel-nut was discovered beneath the clavicle. The left lung was also bound to the ribs, but less firmly than the right. It was emphysematous, and was completely gorged with blood tected in it.

The heart was pale and flabby; the right auricle and ventricle were greatly dilated: the parietes of the latter were about their healthy.

probable that it was occasioned by the sud- touch. den effusion into the left lung, causing an blood, the right lung having been greatly a gentle aperient every second night. blood, the right lung having been greatly paroxysms in a few days became less vio-condensed from previous disease. I offer lent. The dose was then gradually increased this opinion with much diffidence, as it is contrary to the theory of Laennec and other celebrated pathologists, who attribute venous pulsation to regurgitation of the dose were, entire loss of appetite, and ex-

I have been led to the above explanation of this remarkable symptom, from a consideration of the character of the pulsation. which was a gradual elevation of the vein following each expiration, but was not synchronous with the arterial pulse; and the absence of the atethoscopic signs, which indicate either regurgitation or valvular derangement, and also the remarkable condensation of both lungs, which the postmortem examination disclosed. The fluttering irregular pulsations which occurred during inspiration were probably the result of the auricular contraction, and perfectly coincide with the observations of Dr. Hope on that subject.

SUPERSULPHATE AND SUPER-ACETATE OF IRON.

To the Editor of THE LANCET.

Siz. I have sent you an account of the effects which have almost uniformly resulted in the undermentioned diseases, from the internal exhibition of the solutions of the supersulphate and superacetate of iron. I am, Sir, your obedient servant,

J. PELHAM BUCKLAND. 84, Watling-street, St. Paul's,

Oct. 13, 1835.

The colour of the solution of the superin a fluid state. No tubercles could be desculphate of iron is dark-brown; the taste is exceedingly rough; it dissolves sulphate of quinine, and is decomposed by the same preparations as the sulphate.

Case 1 .- I was consulted in April 1832, natural thickness. All the valves were by a gentleman who had been subject for a considerable time to periodical returns of Remarks.—I was at first inclined to attribute the venous pulsation in this case to terruptedly for three months previously to the diminution of the column of blood oc- his consulting me, and during the whole of curring simultaneously with disease of the that time had taken the subcarbonate of right side of the heart, of the existence of iron in large doses. The paroxysms had now become very severe, and at each intermission the part was the part was the control of the control of the paroxysms had now become very severe, and at each intermission the part was the control of the paroxysms had now become very severe, and at each intermission the part was the paroxysms had now become very severe, and at each intermission the part was the paroxysms had now become very severe. upon further reflection, I think it more der, that he was unable to bear the slightest

I commenced my treatment by giving him obstruction to the free transmission of the Mx of this solution three times a day, and to half a drachin three times a day. He was completely cured within a month.

The effects produced by the increased cessive dryness of the skin, which the patient described as being drawn too tight upon the body. The secretion of urine was very small, the heat of the skin rather diminished. These symptoms arising from the too large dose of the medicine, were entirely removed in a few days by the daily use of warm cathartics. Since this case I have never given it in larger doses than ten minims three times a day. Early last spring, this patient had a return of the complaint, when the liq. ferri supersulphatis was given in smaller doses with success, and without any unpleasant results.

CASE 2 .- I have give several cases of h heneficial effe standing were complet were nearly so, the stre greatly increasing.

De 1

CAR 3.—Night perspirations arising from general debility are very soon checked by its use. In one case I gave it to a geutleman who had been taking sulphate of quinine with sulphuric acid for two months without any benefit. In about ten days from the time of his commencing to take this preparation the perspirations had entirely ceased. This was in 1833, and he has not since had any relapse.

Case 4.— Paruria Mellita, a person residing in Wiltshire, who has had this complaint for two years, took during the first eightteen months, among other remedies, various preparations of iron, the sulphate, tincture of the muriate, ammoniated iron, but did not receive the slightest benefit from either of them; for the last six months, during which he has been my patient, he has taken this preparation in doses of ten minims three times a day. He felt great relief from it within the first month, and is now gaining strength and flesh every day, and losing the other symptoms of the disease.

Remarks.—The medicinal properties of the solution of the supersculphase. It is similar to those of the supersculphase. It is much pleasanter to the taste, and is readily taken by children when mixed with sirup and water. I give this preparation with much hemeit in mesenteric diseases. From one to three drops three times a day in sirup and water, is the dose which I generally prescribe for children of from one to three years of age. In weak chlorotte patients also, this medicine is of great utility. The dose for an udult is from five to ten minims two or three times a day.

Every practitioner is aware of the nunerous complaints in which iron may be exhibited with advantage. In all of them which have as yet fallen under my care, I have found these preparations to agree better with the patient, and occasion less nansea, than those generally used; I therefore have not considered it necessary to occupy more space in particularizing their effects in other instances, the above being quite sufficient to afford a general idea of their properties.

An Hersivorous Man.—Anthony Julian, a native of Var, fell suddenly into such overty during his youth, that he was compelled to eat plants. That which was at trat painful food soon became an object of holos; and although in a few months his was altered, he continued to live which he could which he could be a parted, and his health acrossed in an extraordinary

System der Chireryte von Ph. Pr. von Walther der Philosophie, Medicin, und Chirurgie Doctor de. de. (A System of Surgery) Dy Banos Walthers, I vol. Berlin, 1833. Reimer, pp. 418. (Imported by Schloss.)

WALTHER is one of the truly great surgeons who do honour to his father land, and his works on Physiology and several detached papers on Practical Surgery in the Journal published by Gracfe and himself, have greatly contributed to the progress of the higher order of medical science in the northern states of Germany. To his lectures, he himself, however, attaches more importance than to his writings; they have been delivered regularly ever since 1802, and, enriched with improvements supplied by the entire range of medical literature, and by many years of meditation and experience they have arrived at a state of high maturity. At the medico-chirurgical school of Bamberg, the University of Landshut. Bonn, and Munich, he speaks with a becoming pride now, in his riper years, of having had for auditors many of the most distinguished German surgeons of the present

The volume before us is the first of a series intended to present the whole of his course and system of surgery. It develops the general principles of surgery, and constitutes that to the succeeding volumes, which general does to particular or topographical anatomy. The Professor has, from the first step in his professional career, followed the leading ideas that medicine not only reposes on natural philosophy, but that it is itself natural philosophy. This position being firmly embraced, he cannot admit that its practice as an art, or its utility to society. admits of its division. In every point of view, Walther's System of Surgery merits that name better than any other extant. Those who prefer natural grouping to the A B C arrangement, or who, like Gibbon, "can never digest the alphabetical order." will find in this logical and purely rational system, many charms, and some consolation, for the present form of medical writing which prevails in England.

The forms of disease treated in surgery are divided by the Professor into five classes. To the first belongs inflammation, its terminations and sequelæ (phlogosen); to the 2nd, wounds, solutions of continuity (frammen); to the 3nd, DISPLACEMENTS of

organs, changes of configuity (ectopieen), parations of the cohesion of organic ttructo the 4th, MALFORMATIONS, producing de- tures. They are examined according to struction of function and deformity (pseudo- their form, and the part or tissue injured,morphen); to the 5th, FOREIGN BODIES, penetrating from without or generated within (allenthesen).

In the first chapter, that on inflammation, the adaptation of the treatment to the different forms of malady, is strikingly felicitous. The modifications of treatment, according to the character of the inflammation, where the habit of body is catarrhal, fheumatic, scrofulous, syphilitic, arthritic, or according to the tissues or systems suffering, will be best appreciated by those who have had most experience in practice, and have seen on what slight causes success or failure depends. The indications for bloodletting in inflammation are thus stated : -

"Venesection is indicated with an urgency proportional to the intensity of the inflanmation, the importance and vascularity of the organ, the danger of entire destruction or breaking up of its function,-to the phlegmonous character of the inflammation, the earliness and activity of the stage, the acuteness and tendency to spreading, the freedom from any dyscratic combination,-to the violence of the accompanying fever, the strength of the constitution, the richness of blood, the habits of the patient

with regard to loss of blood.
" Redness of the face, the fulness, strength, and hardness of an incompressible pulse, high-coloured urine, dryness and heat of the skin, are indeed subordinate, but confirmative of the indications. Chronic inflammation frequently requires bloodletting, also dyscratic (scrofulous &c.) inflammation, if it assumes a dangerous appearance; only, in these cases, blood-letting cannot do all that is required; it can only cut short one element (the inflammatory) of the disease; the other (the dyscratic) element is not by that means arrested, but rather furthered in its development.

" Erysipelas, also, particularly of the face, bears and requires bleeding, keeping at the same time in view the origin and character of the fever, and the complications and likelihood of its return.

Also in children a little advanced in age, venesection is necessary in dangerons inflammation. Menstruation, the lochial discharge, hemorrhoids, are by no means invariable counter-indications.

Suppuration and the other terminations philosophic reasoning and kinds of inflammation are afterwards surgical science examined in the most comprehensive man- surpasses any work lately ner, Wounds are defined as violent se-

in the skin, the muscles and tendons, vessels, nerves, and hones (fractures). Cuts, stabs, bruises, laccrations, gun-shot wounds, poisoned wounds, inoculated wounds (chancres, hydrophobic wounds, &c.), are treatul successive chapters.

General and ingenious ideas are occasionally met with like the following, in the first chapter of the class of "displacements," the value of which will not be fully appreciated by every reader:-

" The organs of the human body are fixed in certain predestined localities. They can neither be developed, nourished, nor grow, and rightly fulfil their functions, unless they are placed in that precise local relation on which their insertion in the vascular and nervous systems, and their relation to the neighbouring organs,-by which they are supported in their functions,-in great part depend. As families of plants are confined in their geographical distribution to particular zones, to various degrees of latitude and longitude, to a definite elevation above the level of the sea, to certain climates, so is there for the organs of the human body a topical arrangement and normal position. Therefore, viewed in their totality, similar organs in the different classes of animals, always live in the same or corresponding places, and every displacement is also a correlative loss of dignity and destination for the dislodged organ."

Intussusception, hernia, prolapsus uteri. dislocation, paraphymosis, belong to this class.

Malformations of every kind, harelip, cleft palate, imperforations, strictures, ectasies, anemysms, varices, anemysms by anastomosis (telangiectasie), curvatures, and clubfeet, form, in separate chapters, the fourth division (pseudomorphen).

Further remarks on this work are unnecessary. The reader must have seen sufficient to enable him to understand the author's arrangement. Without extracting more than our limits will admit, it would be impossible to give a just notion of its trinsic value. For condens

On the Power, Wisdom, and Goodness of God, as manifested in the Creation of Animals, be and in their History, Habits, and Instincts. By the Rev. WILLIAM KIRBY, M.A., F.R. S., &c. Vols. 1 and 2. London, Pickering, 1835. byo.

THE author commences his work by remarks on the opinions of the two wellknown French philosophers, La Place and Lamarck, but more especially on those of the latter, as being pre-eminently the works of naturalists. Although we cannot agree with many of the ideas started by the latter in his " Philosophical Zoology," we nevertheless think they deserve the consideration of inquirers after truth. His main hypothesis of the gradual conversion of the lower into the higher order of organized beings, by the influence of external circumstances, assisted by "the lapse of ages," is not satisfactorily made out. He has certainly produced a few facts to show, that when an organ is not used, its power gradually declines until it may be said not to exist; and, rice rersii, that when it is much used, what may be called its "natural" state is rendered more perfect. This is matter of common observation, and has been long known Lamarck, however, has considered it more particularly than have the generality of physiologists; and although he has made some ingenious ileductions from it, and some that are correct, we still think that every impartial man who has attended to the subject, will so far agree with Mr. Kirby as to nerceive, that the French philosopher has by no means yet brought forward a sufficient number of facts to establish his main hypothesis. Lamarck perceiving that change of circumstances, assisted by time, will to a certainty produce some variety in the arimal species, has conceived, that such change of circumstances, aided by an incalcutable extent of time, may have produced all the varieties which we see in the organized world. The hypothesis is plausible at first sight, because it is not altogether unsupported by facts; but when examined more closely, it is obvious that by far the greater part of it, though not altogether " irraas Mr. Kirby calls it (page 24), has in observation, exthat at best it can of a bare poswing this point of the rance may be called to the

fact. that Meckel has shown that our life in the womb first resembles the life of an egg or an animalcule, and next that of a fish or a cold-blooded animal, which has only a single heart, till at length, as the time approaches for our appearance in the open light of day, our vitality assumes the character of the warm-blooded species, and we appear in the world with a double heart. Considering these facts, Meckel supposes that he perceives something like a tendency of matter to rise from the lower to the higher forms of existence. We do not think he has added (as he might have done), that not until long after birth does the child acquire what may be called the " true prerogative" of its species,-reason. This,not exactly, as some have said, "built un from the external senses,"-is still something superadded or developed after the animal has risen to the top of the organic scale, and become warm-blooded. Animalcule, reptile, dog, its master. Such seems the ascending series.

Sir Charles Bell, in his "Bridgewater Treatise," is opposed to these ideas of Lamarck and Meckel. He considers the lowest animals to be as perfect in themselves as the highest. This is an argument that deserves consideration from those who engage in these difficult inquiries. The ant and the bear, and indeed some reptiles, such as the crocodile, seem often to have given proofs of sagacity which should make us hesitate whether it is right to consider those animals which will be low in Lamarck's and Mcckel's series, as so ranging in reality. The world is one vast piece of mechanism (some may say), every part of which is so arranged, as to fulfil the intentions of the incomprehensible Artificer; and it is absurd to consider one part to be higher or lower, more perfect or less perfect, than another. With regard to Meckel's above-stated observation, it seems to be the sole instance that we at present have of life beginning at what we call the "bottom" of the scale, and gradually ascending to the top. Conceiving it to apply not only to the human species, but to all the warm blooded species, it is still to be remembered that this all takes place in the body of the parent, and not out of it. There is, properly, at present, so far as we know, not a single example of such a tendency of

after death becomes gradually changed, as decomposition advances, into myriads of animalcules, which again pass into vegetable and thence into animal forms of existence. And this may be the fact, so far as that animalcules are produced by decomposition, and that these, by their death, or, possibly, by their life, may contribute, rising among the vegetable juices, to the vegetation of the seed, by affording it nutrition, or stimulating it, assisted by air and water, to action. But it is not the fact (so far as we at present know), that each animalcule is changed into the seed, or even into a part of the seed. Much less is it a fact, that the lower orders of vegetables are changed into the higher, or into any form of animal life. True it is, that the vegetable, when dead, may,as it were, after another death, - after chemical decomposition by the animal fluids,become changed into a part of the animal again alive. But this is a very different thing from a vegetable actually growing into (changing into) an animal; or an animal of the lowest species changing into an animal belonging to a higher class in what is called the scale of organization.

Again, if it be said,-" But animalcules, which are living matter, are obviously produced from the fermentation of animal or vegetable infusions which are dead matter, and hence display the existence of a disposition in matter to rise from death to life,from a lower to a higher state of being,"we may reply, "That has been questioned." Spallanzani conceived the eggs of the animalcules to float about in the air and elsewhere, and only to be hatched (so to speak) when they accidentally fell into a proper nidus. Such he conceived decomposing infusions to be. Knowing that some of the animalcules may themselves be kept for many years (as the wheeler for instance), and yet show signs of life on being moistened, it seems by no means impossible that

matter as that which is supposed by Lamarck the eggs of those animalcules may float and Meckel, existing out of the parent about in a dry state in the air, perhaps for animal.* Tiedemann, indeed, in his late hundreds of years,* and yet not lose the work on physiology, supposes that our body power of becoming living animalcules, should they chance to fall into an infusion suitable to produce such change. seems to be the less improbable, because these animalcules often propagate by Livision, like vegetables, and the seeds of which we know may be kept dry without injury for years. Lamarck, however, and some other naturalists, seem inclined rather to believe that animalcules are actually generated by decomposition. But there is strong analogy against such a supposition. We have proof that no other insects or animals are so generated. At least such a phenomenon has never yet been discovered in others.

It seems, therefore, to follow from what has been said, that when the visible animals originated, some cause was in operation which is not in operation now; and the same may be said of the transmutation of the lower into the higher forms of existence, if, indeed, this was the order of creation.

We select the following observation with regard to life from Mr. Kirby's Treatise. It affords a specimen of the original views which are frequently to be met with in the work.

"Thus much, however, may be predicated of life, that both in the vegetable and animal, like heat, it is a radiout principle, showing itself by successive developments for a limited period, varying according to the species, when it begins to decline, and finally is extinguished: that sometimes also like heat, as in the seed of the vegetable and egg of the animal, it is latent, not manifesting itself by development, till it is submitted to the action of imponderable fluids conveyed by moisture or incubation. -р. 40.

The reverend author thinks that the hypothesis of Mr. Mantell, viz., that the saurians were the mighty masters of the creation before the existence of the human race, is not altogether satisfactorily made out. "The supposed extinct animals all exhibit a relationship to those that we find now existing and many of them evidently fill up th vacant spaces in the general system. therefore there is no cause to a were originally separa

^{*} Nor does there exist evidence that such a tendency has ever existed. " There are no fossil remains in the lower strata of the earth, of vegetables and animals, of oaks and lions, in ministers ereatures with organs half formed; while in the upper strain they are found in a state of greater per faction." Be "Allan" Discourses against Athelan," Discourse 4, p. 186. This work was not known to us until after the present article was written.

[#] It is not ! floated from the

brought forward in favour of the notion that extinct animals were created at the same time as those which are at present in existence.

In chapter II. a great many ingenious arguments are advanced to show that America may have been stocked with men and animals from the old continents. Land connexions, subsequently swallowed up by the ses, "floating islands of matted wood," similar to those observed by Captain W. H. Smith &c., are urged as possible modes of transmission. The author, in the Appendix to the first volume, and elsewhere, has endeavoured particularly to make geological researches accord with the Mosaic account of the deluge. In aiming at this as a general principle, he is doubtless serving the cause of Scripture; but in urging the existence of coincidences to such an extent as he has attempted to carry them, we doubt much whether he has not overshot his object. This error the traveller committed who, in proof of the transmutation of Lot's wife into salt, announced that he had found the pillar in the desert. The expression relative to the sun standing still, and others of a similar description, show, that however plausibly we may interpret to the letter some parts of the most ancient records, we cannot do so in all. And if we cannot do so in all, to labour at parts shows our anxicty to be more prominent than our wisdom, for partial success must lead to rejections which the interpreters will not desire.

We leave the perplexing subject to make some remarks on the chapter " On Instinct." "An ingenious and acute writer, Mr. French (says the author), is the author of the hypothesis that instinct is the action of some intermediate intelligence employed by the Deity upon the animal exhibiting it,-an hypothesis (continues our author) which appeared in the first number of the Zoological Journal." It seems by another quotation, that Mr. French conceives "these intermediate intelligences to be good and evil, but acting under the control of Providence; such agencies act by impressions us nature, but unperral or intellectual remarks on common phraseology e intelligences would be

to their ellows." We do not, however, ob- called "Angels and Demons," the former serve any new or striking arguments being the cause of the beneficent, the latter of the ferocious instincts of animals. "It is further obvious, (he continues,) that Mr. French believes that the same animal is subject to the agency of both these powers; since, he has observed that in the phoca ursina species, the males manifest the most singular tenderness towards their young progeny, and at the same time a savage and persecuting disposition towards their females."-p. 233.

> Mr. French might have gone farther, and said that as an attraction to the centre and a tendency to motion (the centripetal and centrifugal forces) seem to pervade all inanimate matter,* in like manner two onposing powers, benevolence and malevolence, selfishness and generosity, seem, though in different proportions, to pervade all organized animal matter. We say in "different proportions," for it is obvious that in some animals (man included) the benevolent principle is the stronger, in others the malevolent. Were we called upon to make two grand distinctions on this subject, we should say that herbivorous animals were inspired more particularly by the benevolent powers, and carnivorous by the malevolent; at the same time admitting that even the herbivorous are sometimes actuated by the malevolent influence, and the carnivorous by the benevolent. + There is little that is new in this opinion. Plutarch says, in his Essay on Isis and Osiris. that it was entertained by Zoroaster and the Egyptians. It was the opinion of Plutarch himself-if not in its details, at all events in its outline. It was the opinion of Bayle. Further; it is an opinion that prevails more or less among all educated nations even of the present day. The " Devil" we are sold entered the serpent " in the beginning," and the serpeut has since retained venomous and malignant qualities.

But the reverend author does not coincide with Mr. French in his opinions on in-

^{*} Mr. Kirby bas a remark somewhat similar to this as regards instinct and intelligence, which latter is considered a " principle of limitation."-P. 27, wal. v.

t Having no space for details, we have said nothing y riaving in space (or decisies, we have said nothing) and fate, necessity, or the obstinacy (or opposing power) of matter, suggestions of Plate; yet dues Paley indirectly, in accordance with striplural ductrine, admit the genery of one at least of these. We do the same, and in this way show how the benevolent is stronger than the antagonist power.

stinct. The former mys, It never can be because the treatise of Mr. Kirby does not admitted," that the bee in collecting honey is actuated by "the good angel;" and in efforts of vengeance by stinging is excited by the evil spirit. Suppose, however, instead of saying the "good angel," we say "the good power in its nature," and rice versa. This power or "agency" (as Mr. French calls it) may be inherent in the animal or insect, or not. In conceiving it so to be, we perhaps alter somewhat Mr. French's meaning. Certainly it is difficult to conceive that the spirit, angel, power, or agency, exists out of the bee. Its abode must be in the insect. Its dependence on peculiar structure presents another question for discussion.

Mr. Kirby says that he has sometimes seen the flesh-fly deposit her eggs upon the blossom of the carrion plant, evidently mistaking this plant for carrion itself. " It is obvious, he observes, in this instance, that the insect was led by its sense of smell to make this mistake,-fatal to the young, which must inevitably perish from hunger.' With regard to the error committed in this case and others, (where the insects and animals act upon their instinct, and the fact that in this particular instance the sense of smell directs the insect,) Mr. Kirby thinks that the proximate cause of instinct is for the most part physical. (pp. 240 and 266.) We may agree with the rev. author that it is probable that the instinct depends on a physical cause in the case he has brought forward, and yet not entertain an opinion that is inconsistent with the doctrine already advanced, relative to benevolent and malevolent powers or agencies. Mr. Kirby himself does not pretend to account for "the wonderful sequence of actions and manipulations exhibited by the beaver, the bee, the spider, and the ant," on physical causes (page 276). He admits the difficulty in these classes, and as he offers no such satisfactory solution of it as in the case already mentioned, we are at liberty to believe that in many cases instinct may depend on what he calls metaphysical. or at all events mixed causes.

We might fairly be more solicitous to hold the opinions advanced with regard to benevolent and malevolent powers pervading all animal life (and, probably,-as we may attempt to show hereafter, - all vegetable life), ment is only partial, and hence of

(nor, in conjunction with it, does that of either of his colleagues) present more than two or three rational and successful arguments in addition to the evidence furnished by Paley in support of the doctrine of "Divine Benevolence." Yet the work of Mr. Kirby professes especially to be devoted to proofs of "the Power, Wisdom, and Goodness of God,"-subjects on which the Earl of Bridgewater particularly requested works to be "written, printed, and published." We have already, in our observations on the Treatises of Drs. Kidd and Roget, described this opinion, and we now repeat it, at the same time confessing an humble belief that the hypothesis of antagonist Benevolent and Malevolent powers, offers the more satisfactory solution of the difficulty which besets this point of "Natural Theology." But to discuss the various bearings of this proposition, and to show how, amidst the seeming disorder and injustice which in the view of some seem to prevail among the objects and functions of creation, an Universal Spirit of Benevolence may still be ever in operation, is not our present object.

In reference to the different kinds of food by which animals and vegetables are nourished, our author well observes, "The animal does not become the nutriment of the vegetable till it is chemically decomposed; whereas the latter becomes the food of the former either in its green or in its ripe state." This may suggest the remark, that it is doubtful whether plants should be considered higher merely as living beings than animals. The rose takes putrescent matter for its food, and converts all that is disgusting both to the sight and to the smell, into much that is delightful to two of the senses, into what is exquisite to the vision and sweetly odorous to the smell. No such power exists in animal matter. Though many birds and animals are beautiful, fragrance they possess not, and none of them that are fair to the eye, can subsist on a putrescent mixture of organic with inorganic matter; but all carry more or less of such mixture within them, though they take it not from without.

It must be admitted, however, has one argument on the manufaction. In stating the suderation. In stating the ou each other, he says blooded animals as warm-blooded, asimals (Page 378.) Probably this

Not so the rose. The queen of flowers is the passages are successively and succinctly biess, and retaining comeliness and whole- and French synonyms. into inoffensive dust. The queens of birds and of humanity perish into odiousness.

Quaint enough is the following erection on criptural theory :-

" It is singular that two classes should be placed in opposition to each other, seemingly so opposite in their character and most of their qualities, as the reptiles and birds-the one the most torpid, doleful, and hateful of animals, symbols of evil demons, - the other vice versa.

But in spite of this apparently striking contrast, a real affinity exists between birds and reptiles (in their general form &c. &c. of course is meant, each too being oviparous); and when we recollect that demons are fallen angels, we may apprehend why God has placed their symbols in the same series."

(Page 441, vol. 2.)

To conclude. Though we differ from the author in some of his opinions, yet we acknowledge the work to be one of merit, and calculated to afford considerable pleasure in the perusal, to thoughtful readers. Many of the observations which it contains are at once original and judicious, and if the pursuit of truth does not always satisfy the reader by its success, the path at least af fords food for meditation. The materials for thought are certainly supplied in his pages, which can rarely be said of "new books" in this age of literary vampation; and in casting yet further abroad a little of the seed which he has therein strewed, we shall probably cause some to alight in a soil that will afford it growth which it would not otherwise obtain.

The Principles of Ophthalmic Surgery; being an Introduction to a Knowledge of the Structure, Functions, and Diseases of the Eye; embracing new views of the Physiology of the Organ of Vision. By John WALKER, Surgeon to the Manchester Eye Institution. London: Taylor, 1834. pp.

THE title of Mr. Walkers work is suffily explanatory of its nature. The strucdiseases of the cyclids, of the the eyeball, the corhoppid, the retina, chamber, the posterior bit, the lackrymal gland, and

perhaps the most accomplished of chemists, discussed. A vocabulary is added, explanaduring life converting corruption into sweet- tory of technical terms, with the German This is exceedsomeness even after death, falling slowly only ingly useful, nay, indispensable to the student, who will readily admit the fact when he finds that there are more than one hundred distinct diseases of the eye, each characterized by some hieroglyphic forged out of Greek, by the laborious wit or the dulness of the Germans. Three hundred technical terms are already employed by the ophthalmologists. In the name of common sense, and on behalf of the verbal memory of their hrethren, we now entreat them to desist from further neological creations, which. instead of diffusing light, threaten us with the perplexities of chaos again. Let our translators resolutely resist the German verhiage. None sooner than ourselves are willing to acknowledge German genius whenever it appears: but we caution our countrymen against giving currency to the piles of lucubrations which are retailed at the Leipsic fairs. A German Professor is an author, often a nomenclaturist, ex officio; and the dense stupidity of a German dunce surnasses any thing of the kind in nature.

The examination of the physiology of the iris, in which Mr. Walker comes to conclusions differing from those generally held. will afford a favourable specimen of his method of reasoning in physiology.

"It has been usual to refer the motions of the iris to a supposed connexion with, or dependence upon, the retina. Many facts may be advanced in proof, that the changes of the pupil are independent of the retina. They have no communication with each other-their nervons supply is totally different, the sensibility and mobility of the iris depending upon the ciliary nerves;-the rctina communicates only with the optic nerve. In many cases of paralysis of the retina, the iris is perfectly active. The onposite condition is also frequently noticed of dilated and motionless pupil, without loss of vision. Either of these conditions is perfectly irreconcilable with the idea of the motions of the iris being dependent upon the retina: both form such an insurmountable objection, that they cannot be got over.

"In the most densely opake cataract. where very little or no light can get to the posterior chamber, the pupil, instead of being proportionally dilated to the unexcited state of the retina, is as active and as much contracted as ever, which could hardly he the case if that activity depend upon the quantity of light sent to the retina.

"To explain this more clearly, we will

adduce two filtrances, jawhich the facts will found that after cutting away the eyelids in speak for themselves. 1. A.B. is affected birds, the contraction of the pupil accomwith cataract of both eyes. The lenses are so opake, as to allow of scarcely any light getting to the retina, consequently he is unable to discern any object but very indis-tinctly. His pupils will be as much contracted as those of any other person. 2. C.D. has no cataract. His vision is perfect. He is placed in a darkened room, where there is so little light to affect the retina, that he is unable to discern any object but very indistinctly. His pupils will be widely dilated. In these instances the retina is similarly situated as to the stimulus of light; and yet contracted in the other. The inference to be drawn from these facts is, that the exthe light, and that the contraction of the pupil is the result of that action; and, con- birth, both these membranes disappear tosequently, that the latter is not influenced by? the quantity of light sent to the retina.

"In the state of sleep the pupil is powerfully contracted, whilst the retina is unemployed, and in a state of complete repose.

"By means of the lenticular ganglion, which gives off the ciliary nerves, the iris is connected with the palpebra, by the third and fifth pairs of nerves; and all its relations seem to be with the cyclids and not with the retina. It is very common to find them both simultaneously affected with discase: - thus, if there be paralysis of the third nerves, the levator palpebræ and the iris are both motionless. In the experiments of Magendie, when the fifth nerve was divided, in dogs and cats, in whom the arrangement of these nerves is the same as in man, the iris was paralyzed, and the cyclids could not An Introduction to Hospital Practice in he closed. I have seen disease, in which the eyelids and iris were both in a state of continued spasmodic action, a constant twitching and closure of the eyelids, and a corresponding rapid contraction and partial dilatation of the pupil, owing apparently to irritation affecting the fifth pair of nerves. Instances of this affection cannot be considered as by any means uncommon, since it is particularly noticed by Beer, to whom it could therefore be nowise strange.

"By reference to the facts of comparative anatomy, this view of the relation between the palpebræ and iris is strengthened and confirmed. Insects are devoid of either. In fish we find the iris perfectly formed (as a portion of the optical apparatus), but motionless and no eyelids. In the amphibia the iris is also present, with a feeble languid motion; and here we have the first rudiments of cyclids; these consist of folds of the common integument, with which the animal occasionally covers the eve, placed anteriorly and posteriorly, and resembling the third eyelid of birds and the mammalia. In birds the eyelids are perfectly developed, and the iris exceedingly active. Keiser the superintending care of o

panied every fruitless attempt to close the lids; so that it would appear that the motions of the iris are voluntary in them. Carus, from whose 'Comparative Anatomy' these facts are taken, asks, 'Does not this consonance of motion in the eyelids and iris, as well as the development of mobility in the latter at the same time with the first appearance of eyelids, go far towards proving its muscularity?" It may be taken equally as a proof of their mutual action and relation.

"In the mammalia we find the same strikwe find the pupil dilated in the one case, and ling analogy between the eyelids and iris. Before birth, as in man, the pupil is sealed up with the papillary membrane, and the terior of the eye and iris are acted on by eyelids are closed by a similar membrane; and in those animals which are blind at gether.

"From all these remarkable and striking agreements, it is not too much to draw the inference I have done, viz., that the sympa-thies and relations of the iris are with the paipebræ and not with the retina. I challenge the advocates of the latter opinion to bring forward such a string of facts in support of that view."

We recommend Mr. Walker's book as a very meritorious performance; every subject which he has discussed is treated clearly and with good sense.

Various Complaints : being a Clinical Report of Fever, Gant, Rhenmalism, Cholera, Jaundice, Erysipelas, Insanity, &c., and Discoves of the Chest and Heart, with Remarks on their Pathology and Treatmen!. By C. J. B. Aldis, M.A., M.B., and L.M., Inceptor Candidate of the Royal College of Physicians. London: Longman, 1835. 8vo, pp. 125.

Periodical medical literature can render no much greater service to medicine than must result from the publication of carefully-observed and well-digested reports of hospital cases. Physicians and surgeons in large private practice can only present us with general conclusions, leaving us, too often, in ignorance of the facts and observations upon which those conclusions have

been founded. It is for advance or young physicians, spend some hours hospital, to call facts which occur from

"the evidence," of which the more experienced practitioner can only report to us the "summing-up." In the hospitals the medical officers should themselves set the juniors to work, and arrange and complete the mate. rials collected, the independence and honesty of the collectors being the guarantees for the finelity of the reports. If they will be at no pains to perfect the documents produced, at least should they afford every facility to enable others to perfect them. However, there seems to be so much reason for the preservation of secrecy in British hospital practice, that there is no hindrance or obstacle which, with few exceptions, is not thrown in the way of reporting cases honestly and impartially, in the national medical charities of this country. In France, a greater compliment cannot be shown to an hospital medical functionary, however high and eminent his reputation, than to report his cases in the public journals.

There are sometimes, however, followers in the wards of our hospitals on whom the physicians and surgeons can depend,-us a lord can depend upon his amanuensis, or a prince upon his little foot-page; and now and then we have these attackés issuing reports or brochures of cases, " selected," judiciously selected, and fitted for publication with the grand name of the hospital affixed to the title, and an equally grand name in the dedication. Yet such publications must contain much that is veritable, and ought, imperfect though they may be, to present us with much that is valuable.

Dr. C. J. B. Aldis is neither a foot-page nor an amanuensis. He is an M.A., an M.B., an L.M., an I.C.O.I.R.C.O.P.L. aud a D. to his M. E. M. K. W. the 4th, P. and P. to St. George's H., and of all N.I.'s,-which latter series of initials being interpreted, means that Dr. Aldis is a Dedicator "to his Most Excellent Majesty King William the Fourth, Patron and President of St. George's Hospital, and of all noble Institutions .-What a simple thing is science! What grandiloquent personages are some of those gentlemen who follow in its wake! We will furnish our readers with a specimen " which Dr. Aldis has

tion to " the pa-

to lay before the public a full account of tained of engaging him at a reporter at St. George's, notwithstanding the fact that he has been there for a " series of years" learning the occupation. Suppose his most gracious Majesty had met with the following case in our columns, which position it has missed, occupying, instead, a place in page 32 of the "Introduction to Hospital Practice,"-a work which is designed " to prevent numerous valuable facts from sinking into oblivion."

" Case of Infantile Remittent Fever.

"Charles Wellington, æt. 31, admitted December 7, 1831. Pulse 120; skin warm and moist; bowels open and motions dark; urine clear; abdomen rather swelled; emaciated; voracious appetite; coughs and expectorates thick phlegm.

" Had the measles three months ago, which were of an irregular character, and

he has not been well since.

" R. Hydrary. Submur. gr. ij; Pulr. Jacobi gr. j. o. n. Haust. Senna 388, omni mane. Haustus Cetacei 3ss, sextis horis. Diata Lactea.

" 9. Prolapsus ani.

" Enema Aquæ Frigidæ 3ij, quotidie, P.

" 14. P.

" 25. The prolapsus ani has ceased; the injection has consequently been omitted; no

" P. c. Hyd. Submur. et Jalap. alt. nocte. Haust. Sennæ posteris diebus mane.

" Jan. 2, 1832. Cured."

This is verbatim. It constitutes case 17. Does Mr. Aldis seriously present it either to King William or the profession as an hospital report; or does he think himself privileged, as an inceptor candidate, to publish what the merest tyro in the profession, who possessed the same opportunities for observation in the hospital, would be ashained to own? Look at the previous history of the case-" measles of an irregular kind three months ago." How precise! "Has not been well since." How clear a description of the premonitory symptoms and previous state of health!

The report of the 14th day is unique in medical records: " 14th .- P." Probably Mr. Aldis shook his learned head as he wrote the algebraic fact of " P." A shake of the head stood for much with a dramatis persona in His present the " Critic," and may have been equally exthly induced us to pressive here. But then we do not see it. tion we may have enter. Perhaps the printer, to whom the notice of the significant metapose of the head wasbroadside against hemiplegia, paraplegia, new in "composition," omitted "a chake of amaurosis, nervous indigestion, the doulouthe head" after "P.", in ignorance. At any reux, and neuralgia. Like the production of rate it would prove p. of the propaga-line Dr. A. B. and C. D. Turnbull, the presentwork to Dr. Aldis, to obtain the k is not, -Oh, fellow countrymen!-a

thor describes as "cynanche trachcalis," is dismissed in a single case, which occupies three-fourths of a page, while the sum of information on the spasmodic form is contained in the following extract, which embraces every word contained in the article under that head.

" Spasmodic Croup .- This is opposed to the former, which may be termed inflammatory croup. It usually attacks patients suddenly in the night-time, and is unaccompanied by the symptoms of pyrexia, which commonly distinguish the former. There is often an intermission of the disease. The warm bath and antispasmodics compose the treatment.

several works, British and foreign, on dis- the relation of some very obstinate cases eases of the heart. We beg the authors of will prove." These cases are very clearly, those works to consider how absurd have and we have no doubt very fairly, related. been their labours, when they learn that The work is, indeed, one of the best yet Mr. Aldis has discovered that the diseases published on strychnine, and goes as far to of the heart consist simply of hypertrophy verify its efficacy as can any book which and ossification, and that we could print relates to successful cases only, and does not every word which he has to say on the subject of the former in one page of our journal, the latter being concentrated in the following three lines, immediately after dismissing the cases of hypertrophy.

" The remaining diseases of the heart consist in ossifications, which may be palliated by medicine and repose, and life may be prolonged by avoiding excitement."

And it is to give encouragement to such piddlers in cases as Dr. Aldis, that our hospital doors are almost closed against the reporters for the public press!

Practical Observations on the Nature and Treatment of Nervous Diseases, with Remarks on the Efficacy of Strychnine in the more Obstinate Cases. By GRONGE RUSSELL MART, M.R.C.S. L. London. Churchill. 1835. pp. 185.

THIRTY-TWO more miracles performed by strychnine! Mr. Mart has come from Poor Linton H.M. Ship Recoon to the assistance of Dr. was considered an inc Turnbull, and discharged a very destructive "The treatment was co

gagement on the periodicals.

The greater part of the cases reported the same description. That the intains only a catalogue of the same description. That the intains only a catalogue of the same.

The recting who used to escape from shipwreck offered gifts to Neptune, and the temple of the Ocean God contained many proud trophies of his power, which the priests exhibited with immoderate elation to the devout stranger: "Where are the memorials of those who perished?" was a question which overwhelmed them with amazement." We ask Mr. Mart, and we shall continue to ask all the proclaimers of new medicines-" To how many patients did you administer your drug without producing the least advantage from its employment?"

The author of the work on strychnine has " for many years successfully adminis-We have seen, within the last few years, | tered strychnine in paralytic complaints, as pretend to ascertain their duration. The following extract affords a favourable specimen of Mr. Mart's cases :-

" Case 7 .- Thomas Linton, aged 42, had been two years in the Racoon Hospital, in Portsmouth Harbour, before the date of the author's appointment thereto. He was tall, thin, and had a sallow complexion, and was the most intelligent patient in the ward. He stated that he had not quitted his bed for twenty months, except on favourable days, when he was carried on deck for fresh The cause of the palsy was a blow on air. the loins by a fragment of stone, attended with considerable pain at the time, which in a day or two passed off. Sometime afterwards he became alarmed by a feeling of numbress extending along the thigh, and a sensation as though strings were tightly bound round the legs. These symptoms increased, and at the end of three weeks the man was deprived of stotion of the became unable to stand. cure were tried,

ministering some blue pill, and doses of considered to be the only one that is received purgative medicines; the state of the second calculated to aid the student in his inquiries cretions required previous treatment. Afterwards, one-eighth of a grain of strychning was ordered in the form of a pill twice a day, and a dose of a mixture containing diluted sulphuric acid taken at the same time. On the second day the pill was regradually increased to a grain in twenty-four hours. When the treatment had been continued a month, no amendment occurred; but about this time a blister was applied over the part where the blow was received. On removal of the skin, one quarter of a grain of strychnine was applied twice a day. The blister was dressed daily in this manner till it healed, when another was applied in the vicinity, which was dressed with half a grain of strychnine sprinkled over the denuded surface twice a day, and also mlministered internally in pills containing a quarter of a grain four times a day. Six weeks from the commencement, the patient began to improve; convulsive jerks were felt in the legs, and a sense of pricking and other old sensations were experienced; the toes would move involuntarily. An erect posture had been attained several days; the patient sat in a chair, and moved the legs in every direction. He continued to improve in various degrees, but the amendment was always more rapid after blister-This treatment was continued four months, when he was so far recovered as to be discharged from the Hospital Ship, and had light work assigned him. Finally the cure became perfect, and he performed the duties of an able-hodied man.

Practical Anatomy of the Nerves and Vessels supplying the Head, Neck, and Chest, &c .-By EDWARD COCK, Demonstrator of Anatomy at Guy's Hospital.-London, 1835. Schloss. pp. 240.

THE preface to this little work contains an apology from the author for adding one more to the long list of existing "manuals" of anatomy. The excuse, however, is unnecessary. The work is well executed, and we especially approve the plan on which the anatomical researches in the regions displayed is conducted.

There is no occasion for us to enter into a public examination of the contents of the volume, or to analyze its details, which are mirely anatomical. Mr. Cock does not preave made any discoveries; he tion for the manner in wascular and nervous necks and the thorax. d which we have always

in the dissecting-room. Instead of commencing with the large trunks of the arteries and nerves, the author takes them up point where dissectors must commence) at their terminal branches and then follows them to the more deep-seated parts, and intersperses his descriptions with a variety of remarks and directions for dissection, which none but a practical anatomist could have given, and which will render the greatest assistance to the student while he pursues this difficult portion of anatomy, scalpel in hand. In short, the author makes his work say that which the demonstrator would describe riva roce, with the parts before him, and in the same order as that in which the parts present themselves under the knife; and this handy volume may be conscientiously recommended to all those who desire to lay that sound foundation for medical knowledge which can be derived only from a practical acquaintance with the structure and relation of the parts coinposing the human body. The work is issued with the usual extreme neatness of Mr. Schloss, whom we may take this opportunity of recommending to students as the publisher of some excellent and valuable plates of anatomy by Weber, especially his Anatomical Atlas.

THE LANCET.

London, Saturday, October 17, 1835.

THE remarks which we have recently offered to the profession and the public, on the fraudulent lecture and certificate system. have produced, it appears, the desired effect on some of the most guilty of the delinquent parties. There is no trusting them to discass this question, except in favour of one side. As all the arguments, therefore, are with us; all the calamnies, all the falsehood, or, to speak plainly, all the lies, are to be found in the columns of our opponents. It is pretended by our veracious adversaries that we advocate the apprenticeship system, and that we contend for the proposition of totally abolishing the practice of lec-

public and private medical schools; | tion, know well enough that THE LANCET -that therefore, we large enery surgeon should be supplying his pupil with a con ledge of every branch of medical ad that the pupil should derive no other with respect to instruction in medicine, that that which can be furnished to him by the gentleman to whom he is articled as an apprentice.

It is not in our power to present any specimen to our readers as a refined mode of lying, because nothing more gross, more truly gross, in the shape of falsehood, was ever presented to the observation of intelligent men. What we have been seeking to establish - and this is as well known to our shallow-pated opponents as it is to the profession-is a system of education in medicine, which has its foundation in principles of justice,-a system which will necessarily confer on all practitioners of medicine, the privilege, when they are competent, of supplyabuses which arise out of the certificate ever, this self-same student makes his apsyslem, enforced and sanctioned as it is by pearance in the metropolis, with the avowed the rulers of our colleges and companies.

rations and falsehoods, we derive the greatest culated to give satisfaction to the share of satisfaction; for of what use is it to student, to the public or to sur apply the lash, unless we can make the apothecaries, whose are galled jades wince? The adversaries of a unceremoniquely in just and rational system of medical educa- in the "recogni

that has ever been opposed to a compalsory system of instruction of any kind, other than what is demanded by the capacity of pupil to undergo a searching public ination. To this extent our advocacy have not some a single step. The system of compulsory apprenticeship, instead of being lauded in this journal, has been denounced by us, as well also as has the disgusting humbug of "recognised" courses " "four months" and of "six months" duration. It has ever been the object of our labours to set both practitioners and students free from such odious and pernicious trammels, as far as may be necessary to suit the interests and conditions of persons against whom the "recognised" system may operate-if not as an institution of extortion, at any rate as a provision which must be attended with great disadvantage. By the Apothecaries' Act of 1815-a meaing their apprentices or pupils with a com- sure which has called forth so many pages petent knowledge of the theory or practice of eulogium from the pen of the hired hack of the science of medicine. Hence, on a of the corruptionist—the student in medivariety of occasions, we have felt it to be our cine who desires to practise as an apothebounden duty, in justice to the public, and cary in England and Wales, must serve an in justice, too, to surgeons who are engaged apprenticeship to an apothecary for a period in private practice, to expose the enormous, of "not less than five years." When, howobject of obtaining his license at Apotheca-But the exposure, it seems, is a source of ries' Hall, he is required to commence his grievous annoyance to certain of our empty- studies de noro, and certain rules are preheaded lecturers. We are glad of it. When, therefore, our opponents to a more degrading, a more expensive orare most liberal in giving utterance to vitupe- deal. Is this a state of things which is valWhy, we ask, if the private practitioner be endowed with sufficient acquirements, and be gifted with an adequate share of industry, to convey to his pupil an admits knowledge of the various branches discouraged from pursuing a companies of the individual who is placed under his charge?

And pray, who are the practitioners whose abilities are spurned by the Colleges, and whose acquirements are made the subject of vulgar ribaldry by MACLEOP and the rest of his ignorant clique? It happens, strangely enough, that they are gentlemen who have endured all the tortures and the costliness of the certificate system, and have been proclaimed by the ruling authorities to be perfectly qualified to undertake the duties of medical practitioners. And who are the lecturers? Why, persons who, in point of legal professional qualifications, possess no higher, no better claims on public confidence. Yet in the one case, a "certificate" of three months' attendance on oral discourses, delivered daily, during a single hour, is "recognised," is received as entitling the candidate to possess the license or the diploma; whilst a testimonial of attendance during "five years" at the bedside of the sick, in the dispensary, in the laboratory, and in the botanic garden, of an able surgeon-apothecary engaged during the five years not only in the ordinary duties of his profession, but in conveying instruction to the mind of his industrious pupil, is rejected with contempt and scorn, and the hospital and "recognised" functionaries command such dirty miscreants as their toad-cating hack MACLEOD, to hold up and exhibit the private practitioner to the public, as a person sho has not a sufficient knowledge of his to instruct a pupil in the mere of medicine. Notruly extortion-

of the system of "cer-

Mon ." and is th it a single benen a tendency to counteract thle disadvantages. If the gobre of our colleges and medical companies had been stimulated in the performance of their duty by a generous desire to make the path of study smooth and easy to the student,-to afford to the surgeon in private practice a just reward for his assiduity in cultivating the minds of his pupils, and to maintain the public health on a secure basis .- every encouragement and inducement would have been held out to surgeons and apothecaries, to excite them to undertake, with promptitude and perseverance, the labour of giving the best instruction to all those students in medicine who might be placed under their roof, or within the limits of their control. If lecturers, by the mere habit of lecturing in a slovenly and formal manner, can acquire in the course of years a knowledge of the science of medicine which is not enjoined by persons similarly engaged, surely common sense would suggest the propriety of adding to the greatest possible extent to the number of teachers, and of widening the surface whereon they might exercise their beneficial labours. It is not our object to contend that A or B is qualified to instruct a student adequately in the whole vast field of medical science; but we contend that every private practitioner should enjoy the right of obtaining for his pupil an examination before those men who have been empowered by Parliament to protect the public against the evil practices of incompetent or unqualified practitioners. When our dastardly and contemptible opponents can show that such a privilege as this ought not to be placed under the control of surgeons and apothecaries engaged in general practice, it is possible that the revilers may cease to disturb their virtuous feelings, by discontinuing a practice with which they have long been so familiar, that of a wholesale traffic in falsehood.

It is, however, after all the conly amusing but delightful to witness the shifts to which the corruptionists, their abettors, are driven to sustain their tottering cause even for only a few months longer. All their sade deavours, however, will prove unavailing the flat of public opinion has gone forth against the extortioners. The entire system of corruption has been exposed. Within a few months from this date it will disappear for ever, and,—

" Like the baseless fabric of a vision, Leave not a wreck behind."

In the parish of St. Clement Danes, a smart contest is now existing for the office of parochial surgeon. There are two candidates for the situation, Mr. Cosgreave, who has held it for nine years, and Mr. DUNN, a surgeon who offered himself as a candidate on a former occasion. The claims of Mr. Cosgreave are founded upon past services; those of Mr. Dunn rest on the principle that the office of parochial surgeon is one of honour, and not one of emolament, and that it should not be permanently held by one individual, whatever his merits. -whatever may have been the value of his labours. From this doctrine, which is advocated so zealously by Mr. DUNN and his friends, we dissent entirely; nor can we conceive that one more injurious to the interests of the poor, or more derogatory from the character of the profession, can be advanced by a medical practitioner. We take the question, therefore, between the two candidates-regarding both of them as eligible in point of medical rank and skill-to stand simply thus, -that if there be no wellfounded complaints, no instances of culpable neglect, no charge of want of ability in the treatment of the sick poor, to be sustained-proved-against Mr. Cosgreave. that gentleman, upon every principle of equity, of justice, and of good policy, ought to be reappointed to the vacant office. On the other hand, if accusations, such as we

ference. Is it, we would ask, to be tolerated, that the sick poor of our parishes are to be made the mere stepping stones to easinence or wealth? Are they to be made objects of sport for the gratification of ambitious feelings? Really, on reflection, Mr. DUNN must himself perceive that he has advocated a doctrine which strikes at the very happiness and well-being of the poor, and that he himself, at the end of a year of excessive labour and devotedness to the cause of the afflicted applicants for parochial aid, may be made the victim of a principle which we are certain he has thoughtlessly advocated in the present contest. If Mr. Cos-GREAVE is to be rejected in the absence of sustained complaint, why is any other officer to be permitted to continue in his post? If fidelity of service be no security for permanency of occupation, then, indeed, we have mistaken reform for change, improvement for alteration. It is said that the contest is a party one, and that Mr. COSGREAVE is supported by the Tories. The medical treatment of the sick poor, a party question! The announcement is too frightful to dwell on. Humanity and faction have no sympathics in common. If the reformers of Saint Clement Danes are desirous of proving that their love of alteration is more ardent than their desire for emendation, they will support Mr. DUNNin the absence of established complaints against the claims of Mr. Cosgrave. But if, on the other hand, they are auxious to sustain their character for humanity, and of showing the public that they are determined to promote the well-being of the suffering poor who are committed to their charge,that they are above all considerations of angry party politics,-they will, at the poll, support that medical officer who, during nine years, has discharged his dut parish and to the afflicts manity, industry, and

ACCOUNT OF THE

PARISIAN INSTITUTIONS FOR MEDICAL EDUCATION.

SESSION OF 1835-36, COMMENCING IN NOVEMBER 1835.

THE LANCET for the present year, we gave, of containing from 1500 to 2000 persons. according to our annual custom, an account! The instruction of the medical youths in

place amongst them every year. In Paris' tique, there is but one school of medicine, the

THE VENEREAL HOSPITAL.

Surgeons .- M. Cullerier, M. Ricord, and M. Mance ; attendance at 7 a. m .- Clinical r lectures occasionally given.

This fine hospital, containing more than 600 beds, for patients of both sexes, is situate in the Rue des Capucins, not very far from the School of Medicine. It affords the best opportunities for the study of the venereal disease; and although the number of students admitted to the practice is limited, M. Ricord, whose politeness to foreigners is proverbial, grants the latter every indulgence in his power. Thursday, being a kind of idle day at the great operating hospitals, is the day which is generally chosen by strangers and students for "a visit to the Venereal." M. Ricord from time to time publicly examines the whole of the female patients under his care, with the speculum, when a "turn up" takes place which visitors would certainly see in no other country.

HOPITAL DE L'ECOLE.

This small hespital, which has just been finished, occupies one side of the Place de l'Ecole de Medecine, immediately opposite the Ecole itself. It contains about 150 beds, distributed amongst medical, surgical, and obstetrical nationts.

Physician .-- M. Rostan; Clinical Lecture three times a week at 7 a.m.

Surgeous, - M. Cloquet; Clinical Lecture three times a week at 7 a.m. - M. Dubois; citto at 8 a.m.

This hospital is specially destined for the instruction of students who have entered on their "fourth year," but every student is requested to attend the practice without discrimination. The clinique of M. Rostan is, perhaps, one of the most instructive that the student can follow. Not content simply with remarks which are fall of interest, delivered at the bed-side, M. Rostan frequently selects a pupil from amongst the crowd which follows him, requests him to examine the patient, and requires a diagnosis of the nature of the disease, and a plan of treatment, with the reasons for its adoption. Thus a regular consultation is held in the presence of the pupils, who become accustomed to form a judgment for themselves, and are not induced or compelled, as is too shen the case in cliniques, to adopt impliopinions which are given out by

> conchement, which is of M. Paul Duto French students upon their fourth year of

admitted. We are not, nowever, to accuse the hospital functionaries of selfishness on this account. The number of beds appropriated to accouchements, in this small hospital, is not sufficient to satisfy the wants of French students themselves. Foreigners cannot, therefore, complain with any justice. It is right, however, to mention that all students (a circumstance which is not generally known) are permitted to attend the clinical lectures of M. Dubois, and to follow his visit through the wards, where he frequently makes some clinical observations, the only privilege reserved for the French student being that of delivering the women, and practising the toucher.

We may here remark, en passant, that midwifery is the only branch of medicine which is not well taught in Paris. Let no foreigner who desires to pay special attention to this branch of the science, think of remaining an instant in the French capital, but proceed at once to Heidelberg, or, still better, to Vienna. There are, indeed, mmerous private teachers of midwifery at Paris, who give a course of lectures for five or six weeks, during which they deliver two or three women in presence of the class, and demonstrate the positions of the feetus and the mechanism of labour upon what are called "mannequins," i. c. a stuffed pelvis, with an artificial fortus. The pupil also has an opportunity of practising the toucher a certain number of times during the course, but as the same women are "touched" in nearly all the theatres, and frequently we believe by several different classes in the same evening, the state of parts is such that very little can be learned from them.

HOPITAL DES ENFANS MALADES.

Physicians.- M. Jadelot; at 10 or 11 a.m.; very irregular. M. Guersent; at 9 to 10 a.m. M. Baudelocque; at 8 to 9 a.m. M. Bouncau: ditto a.m.

Surgeon .- M. Baffos ; at 6 to 7 a m.

This hospital contains 560 beds, about 500 of which are appropriated to medical diseases. The service of the hospital is divided into four parts; viz: the acute discases of boys; the acute diseases of girls; the scrofulous patients, and the skin discases, principally comprising the itch. Each physician takes a division for six months, at the expiration of which he exchanges it for another. The great distance of this hospital from the school of medicine is, perhaps, the reason why it is comparatively described by the students. It is a rarity to see the physicians of the acute wards attended by more than four or five pupils; however, it affords a good opporiduates in medicine are not tunity for studying the diseases of children,

some difficulty in feeling the stone, but of one or two days. These attacks occurred of the triple phosphate. The first stone was variable; headache. about one inch and a half long and half an rather more than eleven minutes.

We can only remark that eighty years is not an uncommon age to close the life of a patient whether near or soon after an oneration, which in this instance was admirably performed.

GASTRODYNIA TREATED WITH CREOSOFF.

Dr. Elliotson, in his last lecture, referred to the case of Catherine O'Keefe, aged 47, who was admitted into the hospital under his care on the 25th of August last. She stated on her admission that she was married, and the mother of four children. She has not menstruated since Christmas. She began about nine years She is now almost ago to experience severe spasmodic pains and the epigastrium in the stomach, occurring in paroxysms of pressure. Her tongue is two or three hours duration, and at intervals good, the prize 70, and full

having quickly afterwards succeeded in his invariably a few hours after dinner. Blistersearch, he introduced a small forceps and ing, bleeding, and the administration of grasped a calculus, which was so friable that mercury to salivation on several occasions, it broke in the blades of the instrument; a had produced no relief from her sufferings, portion was removed immediately, the re-mating parts in the course of a few seconds. On introducing the searcher, another stone, of larger dimensions, was detected, and dieal treatment. About nine months just attempted to be grasped by the forceps she began to experience pain, and a sensaseveral times, but without success, as it tion of weight between the shoulders. She kept slipping from the hold of the instru- was also troubled with sour eractations, and ment. Both the small and large forceps a burning pain along the e-sophagus. On were several times employed, and a firm her admission she was quite free from pain grasp having been obtained with the latter, when the stomach was empty, but her sufthe stone was about to be removed, when ferings commenced as soon as she had the incision was found to be too small to taken rood. When the pain attacked her, allow its passage outwards to be effected, she could only be on her back, in which The operator now introduced the knife and position, indeed, she always was most comdivided the right side of the prostate, when fortable. The abdomen was very tender to the stone was immediately removed; not the teach. The pain was always relieved more than two tablespoonfuls of blood were; by hot ingesta; her pulse was 60 and small; lost in the operation. The stones were of her tongue covered with white for; the the lithic-acid species, with an outer coating bowels regular, the urine clear; appetite

Some medicine had been given to occasionally been very severe; a day or two ture. To-day the pain in the stomach is more severe; she has scarcely any rest at night; her apactite is gone. Palse 78. Dr. Elliorson considered that the medicine had not had a fair trial. It had been gradually increased to eight minim doses, and he now ordered ten minims to be taken every four hours.

17. The pain is less. She has noticed a considerable increase in the quantity of her urine since taking the medicine. She now takes fourteen minims every four hours, and oftener if the pain rotarns. She deeperience much benefit taken during the pain.

25. Has been ing

Oct. 6. Her dose of crossote has been gradually increased to eighteen minims, with decidedly good effect. Indeed she is so much better as to be placed on the books "s " cured," but there is occasionally a very slight pain in the stomach.

Dr Elliotson remarked that this was a case which was not likely to be relieved by blistering, bleeding, or mercury. Aromaties, be observed, were generally employed with benefit, and pressure usually produced relief during the paroxysm. There was no doubt that the pain was exceedingly severe in these cases. He had never heard of a case in which an attack was fatal, Lut he thought such a result possible. As to the six weeks since she took some medicine, remedy administered, of course it would not be necessary to carry it to the extent in supposed to be balsam of consiba, three all cases to which it had been employed in the present inscance.

CLINICAL LECTURES.

fatory address was unnecessary, the lectures and in the commissure between the hymphae are much enlarged, not having been discontinued during the sunmencing, a course. healed.

From this period up to the time of her leaving the hospital "cured," no event occurred to recard her perfect recovery. She was delivered of a male child the day after our last date. The child had a slight erysipelatous blush over the right side of the neck and ear, which was removed by slight purgation with castor oil, and on the 24th June she went out quite well.

Case 2 .- Sarah Blake, ætat. 19, admitted, March 27, under Mr. WALKER. Her present symptoms came on about nine weeks since, with gonorrhoal discharge, scalding, &c. She has had condylomata for a period of five weeks. She has had only one connexion, nine weeks since. There is at present a profuse, thick, dark, yellow discharge from the vagina, with excoriation of the the outside of each labium, between it and the thigh; there are some also on the perineum and nodes; some are in an incipient, and others in a full state of ulceration. The right tonsil of the throat is enlarged, and covered by a slight superficial ulceration. Her general health is good, the bowels are confined. The catamenia are regular, and commenced at fourteen years. A Senna Diluted Solution of the Acetale of Lead to be applied to the parts ulcerated.

April 3. The vaginal discharge is less in quantity, but there is much excoriation of the thighs, the perincum and nates, going parts, with some ulceration on the right side of the orifice of the vagina. The right tonsil is less swollen; the ulceration covering it is healed; the bowels are quite regular. Powdered Cubebs 5ij four times daily.

12. The discharge has rather increased in quantity; the ulcerated surface has healed, but there is still some excoriation around the meatus urinarius. The right tonsil is looking better, and has a more healthy appearance; there is some vascularity about the fauces. The medicines were ordered to be continued.

17. Catamenia are present; the medicines are ordered to be intermitted; in other respects progressing favourably.

24. The vaginal discharge has been more profuse since the cubebs has been omitted, and she complains to-day of some headache. There is intertrigo in the commissure behind each labium, with considerable vascularity and excoriations of the vagina. The Powdered Cubebe to be resumed in 3ij

completely disappressed under the Confection deser three times daily. The vagina to be injected with a Diluted Solution of the Acc-

tate of Lead in the proportion of gr. lv to 3j.
31. The discharge has very much improved; there is still some vascularity, but ses exceriation of the vagina. The Pose-The debut was ordered to be omitted, and the was ordered to be omitted, and the fastion of Cubebs used instead, of 31 to be being water, as an injection.

The discharge has become much worse since the internal use of the cubebs

has been discontinued. The bowels are confined; the tonsils have nearly regained

their natural size.

10. The symptoms remaining much the same, she was ordered the following vaginal injection: - Muriate of Ammonia Siij; Water 0j: to be used frequently.

15. The injection has been of great service, the discharge has nearly ceased, and what remains is of a pale-yellow colour.

21. The discharge has remained stationary for a few days. She complains of headache and loss of appetite. The injection to be increased in the proportion of 388 to 0). Calomel and Antimonial Powder, of each two grains, to be taken to-night at bed-

29. On examining the vestibulum there orifice. The condylomata are situated on is some slight vascularity, but all trace of discharge is gone. She was discharged

Case 3.-Bathia Mitchell, atat. 24,admitted on the same day with the above patient. Her complaints commenced with discharge and scalding, which she has had for four months. She has had condylomatous ulceration for three months. Her throat has Draught to be taken immediately, and a never been affected; there is at present an extensive condylomatous ulceration occupying the labia, which are thick, hard, and swollen, this extends also to the inside of behind the anns; there is a profuse thick yellow discharge from the vagina; the right tonsil is enlarged and slightly ulcerated; the health is quite good; the bowels are confined; the catamenial discharge, which commenced at sixteen, is regular; the same preliminary treatment of a purging Senua Draught and the Black Lotion to the ulcerated parts was adopted, and on the

29th, she began using the Oxymuriate of Mercury Lotion in the proportion of gr. sa to 3j, and took Washed Sulphur 3j twice

April 1. She was ordered to take the White Mixture Jiss * every night at bedtime, and to go on with her other internal and external medicines.

3. The condylomata many of the ulcerations ulcers occurred in

use Pall her medicines.

8. The tonsillar ulceration has healed, the white pustular appearance upon it resembles a warty excrescence.

12. The condylomata are becoming flat, thickened, and have a bluish appearance; the vaginal discharge is diminishing; the white holy on the tonsil is irregular upon was ordered to be applied to the ulcers, and its surface, and hard to the touch.

19. The condylomata are nearly all gone, injection. leaving behind some few spots of discolora-

tion. To continue her medicines.

21. The wart on the tousil presents the creased in size.

24. She is convalescent, and is to leave the hospital.

nal discharge, which has lasted three weeks. and some condylomatons alcerations for two weeks; the orifice of the vagina is vascular, and there is slight swelling and tomefaction of the left labium; there are numerous small circular condylomata, aggregated, but not confluent, over the region of the perincum, and on the inside of both nates; there is superficial ulceration, approaching to excoriation, of the skin around. The throat is preternaturally vascular, but she does not complain of any difficulty in deglutition. The right tonsil is enlarged, and bears the same warty growth (but smaller in size) alluded to when she was formerly in the hospital. Her general health is good, the catamenia are regular, and she has never been pregnant. She was purged with Calomel and Rhubarb, and Senna Draught, and the Decoction of Tormentilla Bark was ordered to be used as an internal injection and an external application. There was, however, no Tormentilla Bark in the hospital, and the Saturnine Lotion was ordered instead. She proceeded with this for some time, and on going round the wards one we learnt from the nurse that she her legs and was off.

Winds .- 1 East; 5 West; 0 North; 12 South; 1 North-east; 7 South-cast; 2 Southwest: 2 North-west.

So much rain has not fallen in September since 1829, and the mean of the barometer was lower than at any time since 1831, while the maximum was below that of any period in the same month during the last twelve years. The month was colder than that of September 1834, and the mean temperature was below the average of the last twelve years. Thunder was heard on the 9th, 23rd, and 26th. On the two former days lightning was seen. On the evening of the 9th, the most brilliant Aurora Borealis which has appeared here since the 7th of January 1831 was observed; - the whole N.W. out the heavens was illuminated by a pale yellow light, from which, ways of scolour shot forth, extending beyond the zenith. These appearanges of nearly two hours. On the 13th, the Aurora was against a red tint, and reached nearly to the zenith, but we continue so long as on the 9th. The Wind on both occasion blew freshly. These phenomena were succeeded by rain.

PATHOLOGICAL ANATOMY.

PATHOLOGICAL Anatomy is treated in this country with a degree of neglect which can be explained only on the supposition that the importance of its study is generally unknown. We have, indeed, a few distintinguished men amongst us who labour to support the national reputation on a level with that of other European nations, but the great mass of medical men, through the imperfect precents of their teachers, or an ill-founded fear of inability to acquire a sufservative" enough to deny? "Exact" we side." may never call the science, but we are satistestion of those causes which retarded the progress

has advanced, and the imperfections which are everywhere confessed to exist, depend not so much on the impossibility or the difficulty of raising medicine to an equality with the precise sciences, as on the manner in which it has hitherto been studied, and the obstacles which have been thrown in its path by those very persons who are most interested in the perfectibility of medicine. The mathematic and algebraic arts are based on fixed principles, and their elements, if we may so call their symbols, are passive and obedient agents in the hand of the professor who works them. But what would be the consequence if $x^2 + 2xy + y^2$ could say to ficient knowledge of morbid anatomy, or the unfortunate algebraist, "Nothing know under the culpable reflection that if they wou of your business. My root no longer simply tread in the steps of their fathers;" shall you work. I will depart to S. or to they will do well enough,-this class of the "L.?" Or what answer could we expect profession continue to practise medicine from a mathematician were we to require purely in an empirical manner, and would him to determine distances with but two never contribute to the advancement of the angles, and without a side of the triangle? science were each to realise the Spanish It is thus with medicine. The great mass compliment, and live a thousand years, of the community, so long as they remain in With such examples, however, before them ignorance, will resemble the refractory symas are to be found in the "high places" of bols of the square root, and counteract medicine, what have we to expect? Yet every effort at a solution of the grand prothat it is time such a state of things should blem of medicine; while those who neglect cease, and that farther and more extended pathological anatomy, commit an error anaefforts should be made to place medicine on a logous to trigonometrists who would say footing with the other sciences, who is "con- | "Give me two angles and I will find you the

The practice of medicine consists of four that a searching examination into the parts:-1. The observation of external phenomena, or symptomatology. 2. The observation of internal phenomena, or pathomable us to show logical anatomy. 3. The study of the conwith which it nexion between the signs and their causes. 4. And, shally, the administration of medicinal agents, or the speutics.

Of the four different parts, the first and last require the least degree of talent for their cultivation. Any person can observe and note down symptoms. Symptoms can never be observed too closely, for although several external phenomena may present themselves which are, apparently, of little note or value, they should, nevertheless, be observed. They are abnormal appearances, and although the relations between cause and effect may now be hid, it may at some future time be discovered. Thus the sudaming and rosy spots which so peculiarly characterize typhoid fevers, were no doubt observed many years ago, but the idea that they were insignificant phenomena led to their neglect; whereas now they form a very principal element in the distinction of that species of fever.

The administration of medicine, or the therapeutic portion of the art of medicine, does not, we have said, require the exercise of much talent. The statement demands a few words of explanation. We fear, from the nature of things, that this, the practical part of medicine, will ever remain empirical. The efficacy of medicines in disease can never be established by a priori reasoning. We can, therefore, only administer them with caution. We here speak of new medicines, and not their effects: but to advance medicine by observation of the effects of medicinal agents, it is obvious that we should previously be thoroughly acquainted with the three other branches of medicine, especially with the doctrine of symptoms, and with morbid anatomy. In a word, that our diagnosis of disease should be as perfect as it can possibly be made. Without this perfection of diagnosis, the practice of medicine, instead of advancing with the experiments made in a therapeutic point of view, will naturally retrograde in direct proportion to the number of those experiments, for this simple reason, that a confusion of results is the consequence, and that it is impossible to see time or place to dray clearly through a multitude of conflicting pils and conscient statements. Hence, next to a careful ex- ers to the subject.

amination of the patient at the bedside, th most important branch of medicine impatho logical anatomy, and we trust that some per severing effort will be made to place this to. long-neglected branch of medical educatio: on proper footing. There is not so much there of good works on pathologica mamongst us, original or translated as the want of a system of instruction, a d : constant and efficient attendance in the dead houses of the hospitals. It is unnecessary to dwell on the common observation, " that " pathological anatomy is of no use, unles: " connected with symptomatology." certainly studied with most advantage in cases where the pupil has been made acquainted with the previous history of the patient, has observed every stage of the case with care, and having become fully possessed of a knowledge of the external signs is ready to compare and examine them in connexion with the appearances which pre sent themselves after death. This is the true way of learning morbid anatomy, and we carnestly recommend the rising genera tion of practitioners to avail themselves o every opportunity of this kind which may offer. They may be assured that thus (independently of the feelings of confidence in the practice of the profession, which will arise from a consciousness of knowledge c the nature of the changes that take place is the internal and invisible surfaces, nearl as complete as of those which pass befor our eyes) the whole aspect of medical sci ence will become changed, and the profession will rise in an instant from the depths t quackery to the rank of a noble science. It our hospitals, men of tried merit should pre side, whose duty it should be to arrange th clinical cases, and examine the bodies c those who die. In some of the continent; hospitals, there are young men expressl appointed and paid to fulfil this duty, an we believe, lodged in the hospitals, who not being distracted by the cares of an enor mous practice, can devote their attention t the instruction of the pupils to an exter which non-resident hospital functionarie are not disposed to, and never will, give.

We are induced to make these remarks the present moment, under the that we could not choose time or place to draw pils and conscients ers to the subject.

ON THE NATURE OF

INFLAMMATORY FEVER.

By HENRY SEARLE, Surgeon, Kennington.

THE term "inflammatory feet when puperly applied, refers only to that general excitement which is prompted." panied by local inflammation. The terms "symptomatic," and "sympathetic fevers,"
"pyrexia," and "constitutional irritation,"
are used, synonymously, to designate inflammatory fever.

Whether inflammatory fever ever occurs idiopathically, has been a question of some controversy. It is admitted by some to occur, though seldom, in so simple a form as in the synocha of Cullen; but its appearance in the more complicated form of synochos, from which it in a few days becomes modified into typhus, is very generally acknow-ledged. It is however by no means proved that fever takes place without the existence of local disease as its exciting cause. Broussais, Clutterbuck and others, are opposed to the doctrine of idiopathic fevers; while Dr. Southwood Smith's dogma is—"There are no fevers but idiopathic fevers."

Inflammatory fever may assume a mild or a severe form. The former is simple, consisting in a general excitement of the neryous and vascular systems: the latter is more complicated, being, in addition to the local phlegmasia, accompanied by more or less disturbance of the brain, liver, stomach, or other organs; so that the worst cases may more resemble typhus than simple pyrexia.

The different grades of inflammatory fever that, in cases in which no predisposition to fever exists, even an acute inflammation is and, on the contrary, in cases in which the predisposition is very great, the slightest inflammatory disease gives rise to considerable pyrexia. It may therefore be inferred that the predisposing causes play a greater part in the production of inflammatory fever, than the inflammation itself.

The causes of inflammatory fever admit of being arranged into exciting, predisposing, and secondary or perpetuating causes.

Of exciting causes .- Those inflammatory of inflammation depends upon the texture,

are subjected to sudden compression and distention—as serous membranes, ligaments, and synovial membranes of large joints, the fauces; and the bladder-when inflamed induce more or less pyrexia. Severe and painful injuries also, as compound fractures, burns, &c., frequently produce considerable fever.

The more intense and extensive the inflammation, the more acute the fever: when, however, the pain is so acute as to overwhelm the powers of the whole frame, instead of a high degree of fever, the consequences are, as in very acute gastritis, a low pulse, and cold perspiration.

The predisposing causes are always general, depending upon the nature of the constitution and the state of the health at the accession of the local disease, and especially upon the management of the mus-

cular power during its progress.

It is doubtful whether inflammatory fever ever arises in the absence of a predisposing rause, it being essential to the occurrence of this fever, that the frame be in an excitable state, which state is inversely proportionate to the muscular power. It is true that a very severe and painful injury often produces, even in a strong constitution, a certain degree of febrile excitement in a few hours; but may not this be ascribed to the sudden, although not considerable, exhaustion of the muscular power occasioned by severe pain? This, however, is, at most, an extreme case, and does not affect the general rule-that the lower the grade of muscular power, the greater the excitability of the nervous, and vascular systems, and, consequently, the stronger the predisposition to inflammatory fever. Hunter observes that "in inflammation, when the constitution is strong, do not always correspond to the degree of then it will commonly be the most manageinflammation, since it frequently happens able, for strength lessens irritability." And according to Abernethy, "irritation is debility excited." Numerous eminent physiunattended by any constitutional irritation | cians and surgeons, however, are of opinion that there is no absolute debility when the febrile action is characterized by a frequent and firm pulse. A frequent pulse, in the absence of inflammation, is an admitted sign of debility; and the annexed table will show that the frequent, although energetica pulsation in fever, is indicative of excited action under reduced power.

That functional alliance exists between the nerves of sensation and those of motion, which, in the rising period of life, and in affections which are the most painful, are disease, places their respective powers in the most productive of fever; and the pain inverse relations. For example, very young infants possess the least degree of muscularity, and the greatest degree of sensibility ntonsity and extent of the inflam-of frame; and as the former increases, the latter diminishes, until the muscular system easily swell,-parts becomes fully developed, when they balance parts, and organs which

The comparative view of the various con- accompanied by any constitutional exciteshows, at the same time, how much it hinges their muscular power. upon the deficiency in muscularity, or upon the sudden reduction of muscular power.

In infants, as is well known, a mere spark of internal inflammation will ignite the whole excedingly irritable, and therefore predis-frame. In all persons except the aged, in posed to inflammatory fever-viz. whom sensibility has become much impaired, on ricty, and the habit of inchriation, and even in those to a certain extent, the predisposition to pyrexia under exciting cases due mental maxicip, and is proportioned to the deficiency in muscularity. Those, on the contrary, who are impairs the energy muscular and strong, will sometimes have tone of the muscu a phlegmasia during several weeks, un- the heart and bloody

ditions of the nervous and nuscular systems, ment, so long as they observe their usual given in this table, greatly tends to illus- regimen, and are not subjected to such trate the nature of inflammatory fever, and medical treatment as will deprive them of

l'ew persons, comparatively

whole frame morbidly sensitive. The mind the feelings become readily irritated, the heart becomes subject to palpitations, and the bloodyessels sometimes allow hemorrhages to take place by transudation; the functions of the several organs of the body, particularly those of digestion, become denged. In this predisposed condition of the frame, an attack of inflammation is very liable to occur, and which will certainly induce an acute form of pyrexia, which, if not soon subdued, will be accompanied by the wildest kind of delirium, grave functional lesions, and other signs of low typhoid fever.

The habit of inchination produces a conditional kind of predisposition; for unless it be suddenly and greatly restricted, it does not generally create a predisposition to fever. The drunkard, when deprived of his accustremidous and feeble, and his whole frame irritable. If, then, he be subjected to priwill, under this exciting cause, he highly susceptible of fever, which will be characterized by greater nervous than vascular disturbance, by delirium tremcus, and generally by the absence of the hot skin of fever. The strictly antiphlogistic treatment almost invariably converts the disorder into a highly dangerous form of fever.

Secondary Causes .- During the existence of inflammatory fever, all considerable derangements of the visceral functions tend to perpetuate it, by giving support both to the predisposing and exciting causes. For example, an imperfect function of the brain and spinal marrow will prevent the due distribution of the nervous energy to the muscular system; an imperfect function of the lungs and of the other exerctory organs, prevents that purification of the blood essential to the proper function of the nervous system; an imperfect function of the digestive organs deprives the body of its due nutrition so requisite to the maintenance of muscular tone. Derangements of the visceral functions not only become secondary causes of fever by reducing the muscular power, but frequently an additional source of excitement to the whole frame, especially to the inflamed part, thereby perpetuating both the local disease and the general vascular irritation. If an inquiry be made as to the origin of these derangements, it may be mostly that system of treating inflammawich suddenly reduces all Sometimes a large der frame too near

aggravates both

This view of inflammatory fever is not becomes charged with apprehensions, and offered as entirely new, for it is universally admitted that a delicate and sensitive condition of body is favourable to pyrexia under the existence of inflammation; but notwithstanding the admission of this principle, it is most strangely lost sight of at the bed-side; and why? because the antiphlogistic is the fashionable system of treating inflammatory diseases, before which any principle, however sound, and although recognised, most fall prostrate, rather than be allowed to violate or interdict a system. so sacred as the antiphlogistic. It is, however, hoped, that by invoking a more close attention on the part of the medical profession to the real causes of inflammatory fever, that their relative importance will be more duly estimated; that it will be seen that although the exciting cause, inflammation, is a sine qua non in inflammatory fever, yet tomed stimulus, is deprived at the same time state the predisposing are, in most instances, of his power, his muscular system becomes the causes which have the greatest influonce in the production of fever, and, therefore, that the treatment should be so adaptvation during an attack of inflammation, he ed that, while attempting to remove the exciting cause, it should not, at the same time, he calculated either to increase or to produce the predisposing causes of inflammatory fever.

INTESTINAL OBSTRUCTION

FROM

RAW WHEAT.

To the Editor of THE LANCET.

SIR,-Permit me to transmit to you the report of a case, wherein a fatal result was near occurring, from a habit on the part of the patient of eating raw wheat. I am, Sir, your obedient servant,

J. L. M'CARTHY, M.D. Macroom, October 11, 1835.

On Thursday, the 8th instant, I was sent for to visit John Leary, atat. 35, living at Toames, three miles from hence, a steward in charge of a farm belonging to a gentleman of the name of Penrose. I found the man in bed, labouring under the most agonizing pains, which he referred to the anus, rectum, and loins. He was bathed in sweat; his countenance expressed the greatest anxiety, but he suffered no headache nor delirium. His tongue was coated with a thick white fur, but moist; there was no affection of the chest or of the respiratory faculties, nor any complaint of the stomach, but he had much thirst, urgent desire to urinate, and evacuate the rectum, without accompanying ability to effect either. The abdomen felt quite soft on pressure, except over the pu-

during that of decline, for, as the muscular norvous system, as the pulse faithfully inpower declines, the sensibility also becomes dientes.

In accordance with these views, the foldelicate frame, whose muscular system is lowing table is intended to exhibit a kind of not well developed, are highly sensitive; analysis of inflammatory fever, by showing and whenever the muscular power is greatly that, according to the condition of the musreduced by venesection, spare diet, anxioty cular system, is the sensibility of the ner-of mind or disease, the sensibility is pro-vous; and that, according to the combined portionally increased. On the other hand, conditions of these two systems, the circu-whenever sensation is accumulated by superexcitation, as by the influence of fear, respectively to them in the unexcited and excessive pain, &c., the muscular power is the excited states of the body. Inflammalowered. Instances may, however, be ad- tion is made the chief exciting cause, in duced, in which certain depressing agents, order to show by the pulse that inflammaas intense cold, marsh miasma, opium, &c., tory fever takes place inversely to the musdiminish both the sensibility of the ner- cular power. Miscellaneous temporary exvous, and the power of the muscular, citing causes are also given, merely to afford systems.

J. L. M'CARTHY, M.D. Macroom, October 14, 1835.

On Thursday, the 8th instant, I was sent tenance of muscular tone. Decangements for to visit John Leary, atat. 35, living at Toames, three miles from hence, a steward in charge of a farm belonging to a gentleman of the name of Penrose. I found the man in bed, labouring under the most agonizing pains, which he referred to the anus. rectum, and loins. He was bathed in sweat; and the general vascular irritation. If an his countenance expressed the greatest anxiety, but he suffered no headache nor delirium. His tongue was coated with a stem of treating inflammathick white fur, but moist; there was no suitch suddenly reduces all affection of the chest or of the respiratory Sometimes a large faculties, nor any complaint of the stomach. der frame too near but he had much thirst, urgent desire to aggravates both urinate, and evacuate the rectum, without accompanying ability to effect either. The abdomen felt quite soft on pressure, except over the pubic and left iliac regions, where distention that the attempts to evacuate the bowels had of the bladder, the sigmoid flexure of the brought down more of the wheat into the colon, and the rectum, could plainly be per-frectum, which was again filled to distention,

On making an examination per anum, I found its verge considerably swollen and sphincters, and so tender and irritable, that it was with much difficulty that the patient would allow me to proceed with the examiof the grain as he proceeded, and to that he recovered. attributed his illness. He went on the second day of his illness to the Macroom Dispensary, where he was ordered a dose of castor oil, but no effect followed its exhibition.

Having by mistake omitted to bring a catheter with me, I sent home for one, and in the mean time proceeded to examine the rectum internally. With considerable difficulty I introduced my little-finger, well oiled, up with a hard mass of undigested wheat. servant, The agony which the patient suffered from this exploration, forced me to desist for a short time, when I determined on attempting to extract some of the wheat from the bowel. I accordingly procured a small eggspoon, and having well oiled the handle, into remain until they had melted. This had painful. the effect of lubricating the part and softening the contents of the cavity; so that on a its situation, to be an inflamed and consecond attempt with the spoon-handle I siderably enlarged submaxillary gland. succeeded in clearing out about ten ounces was very painful on being touched, and the more of the wheat, the patient all this time patient was the subject of a high degree of complaining of almost intolerable suffering. fever. I ordered right leeches to be applied Having desisted for a time in order to allow to the tumour, and gave him a calomel boly him some rest, he felt an urgent desire to go and a black draught, with a continuate to stool, but the attempt was unsuccessful, a saline aperient mixture. Ou owing to the tenderness and constriction of saw him again, and found the anus. He was, however, able to urinate, painful, and somewhat and voided about two and a half pounds of ordered the leeches 202 fluid.

On making my next examination, I found days after this.

but the mass was not so hard as in the first instance; and on again operating, I succeeded in removing about twenty ounces inflamed, with great contraction of the more. The patient now expressed himself as much relieved. I had by this time in all brought away about two pounds of wheat.

As I found his pulse full, quick, and nation. He said he had been ill during the bounding, I bled him to 5xxv, when he belast three days; that during the first and came faint. I then had the rectum stuped second days of his attack, he only felt oc- for about an hour, and gave him a draught casional fits of pain in the anus and loins, containing an onnce of Castor Oil, fifty but that for the last sixteen hours, or there- drops of Tincture of Henbauc, and an ounce abouts, he was in extreme agony, with but of Cinnamon water. SALIVARY CONCRETION IN THE SUBMAXILLARY DUCT.

To the Editor of THE LANCET.

Sir,-Should you consider the following case worthy a page in your widely-circuinto that cavity, and found it extremely dis- lated and valuable Journal, the insertion of tended. It was, in fact, completely blocked it will greatly oblige your obedient humble

W. A. ELSTON, Surgeon. Braybrooke, Northamptonshire, Oct. 20, 1835.

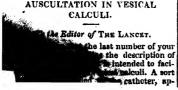

James Whitehead, a young man about troduced it into the rectum, and detached and twenty years of age, called on me, Sept. 4, brought away from the mass about two for my advice respecting a swelling on the ounces of semi-masticated wheat. By this right side of his neck, of which he had been means I obtained a little more room, so that 'the subject at times for four years, but which I was enabled to force into the rectum a few within the last week had considerably insmall pieces of mutton suct, which I allowed creased in size, and become exceedingly

On examination, I considered it, from the purgative medicing

on examination there appeared to be an enlargement at about the termination of the submaxillary duct of the right side, and on justice to truth, positively affirm having six applying my finger I could distinctly feel a small hard substance. I was at once ap-prized of the occasion of all the external swelling and violent pain which the man had complained of for so long a time, and, by means of a probe, gently dilating the orifice, and with a small pair of forceps, to my great satisfaction I extracted from the duct a salivary concretion moulded to the shape of the canal, of about three quarters of an inch in length; the moment this geons in France, in Italy, and in London; plug was removed, his mouth was almost filled with pus of a bloody character, and some clear saliva. He experienced immediate relief, and the swelling was at once reduced from the size of a large hen's egg to a mere trifling enlargement, and it is scarcely necessary to add, that in the course of a few days the man felt himself quite well. There was for the first two or three days a frequent discharge, but after this time he could perceive nothing particular either of the pain or discharge.

I felt much interested in the case, for, on inquiry, I found that he had perceived slight pain and swelling at times for four years previous to this date, and occasionally had had severe pain; and that he scarcely ever sat down to a meal without an almost sudden enlargement of the gland, and particularly so within the last six months, which swelling he could always disperse by pressing on it a short time with his finger.

The sympathy existing between the nerves of smell and taste was, in this case, most beautifully illustrated; for, according to the patient's account, he could never pass a savoury smell without feeling this sudden enlargement, and pain, and he said he had dined but a few days previous to my seeing him from a meal which, to use the man's own words, "always used to make his mouth water," but which in this instance, in consequence of the outlet of the duct being completely closed, had produced so violent a distention of the gland, as at once to set up such a degree of active inflammation, as shortly afterwards led to the discovery of the nature of the disease, and to his relief from suffering.

plained to me of pain under his tongue, and pears to be the principle of this invention.

on examination there appeared to be an en- Without wishing to engage in any discuslargement at about the termination of the sion about so trifling a matter, I may, in years ago applied to Monsieur Charriere of Paris, who made me a long catheter, the handle of which I had topped in the shape of an olive, so as to adapt itself to the ear. I made several experiments on the dead subject with this instrument, and was quite satisfied how easy it was thus to distinguish any and various foreign bodies in the human bladder. I have shown this simple instrument (or spoken of it) to many surnevertheless I am far from accusing Mr. Brookes of taking advantage of the thoughts of another person; and if I am induced to write these lines, it is to corroborate his opinion of the usefulness of such an instrument. The hand of the most talented operator has sometimes deceived his senses. I saw Baron Dupuytren cut for stone where none existed. My friend Professor Roux nobly confesses the same error. I could mention other similar mistakes, but the examples already given are more than enough to prove the utility of using the ear in the examination of the bladder. The hand assisted by the ear will no longer commit such direful errors; nor will patients, operated on for stone by MM. Civiale, Heurteloup, Amussat, &c., be sent away in full security as perfectly cured, with calculi or fragments of stone in their bladder, such cases now heing generally known to have occurred. Hoping, Sir, that surgeons will not henceforth neglect this sign in the diagnosis of diseases of the bladder, I have the honour to be, Sir, your obedient servant,

CLAUDICS TARRAL. Lawson's Bedford Hotel, Paris, October 8, 1835.

THE LANCET.

London, Saturday, October 24, 1835.

In regulating the government of our public, endowed hospitals, no neutral, no middle path between right and wrong, can by any possibility be pursued for any length of time. The circumstances which arise out of their management, must necessarily be productive of good or of evil. Either the inmates of the hospitals must derive advantage from the method of managing those incatheter, ap- stitutions, or their condition must become

absolutely and necessarily descrimated from | public hospitals, are still destitute of resithe neglect or want of skill of the medical officers. It is not often that disease w linger in its career. The constant being attacked by an insidious and deric foe, requires all the auxiliary aid which it is in the power of the profession of medicine to afford, in order to remove suffering and ward off the threatened danger. In some cases the malady requires to be watched hourly. In others a visit made daily by the medical attendant, may be sufficient to satisfy the claims of the afflicted But it is always observed in our public institutions, and even in private practice, that the presence of a physician or a surgeon, who, by his mild and gentle demeanour, and calm and steady firmness in the hour of agony and danger, can ensure the confidence and the favourable opinion of his patient, is enabled to furnish a degree of solace to the mind and feelings of the sufferer, which cannot be derived from any other source.the inspiring smile, and the hopeful and benign assurance of the skilful medical attendant, often carrying with them an influence which is far superior, as an anodyne, to the effect temporarily resulting from the administration of the most powerful drug.

In the conduct of our hospitals, therefore, every person of ordinary observation and reflection would imagine, a priori, that in each of our endowed medical and charitable establishments, there existed an office occupied by a resident medical practitioner of highly-gifted attainments in medicine and surgery, who was fully adequate, on all occasions, to meet the emergencies which must arise in such establishments from the rayages of maladies of a serious character. and by the admission of injuries resulting from accidents of a dangerous and alarming description. Still, however, in this, the thirty-fifth year of the nineteenth century. we find it to be our duty to announce to the members of the medical profession, and to the British public, that the largest, the wealthiest, the most splendid of our endowed scarcely be faithfulled

dent surgeons. A fact of this description a not only a stain on the character of the with respect to the general policy of wa, but it is also a stigma on its renu-Lhomanity.

of the minor establishments we know, and well, that there are persons who are denominated "house-surgeons;" but they are beardless lads, who have bought themselves into "office." We know equally well also, that there are medical officers attached to the various hospitals, but amongst these how many individuals are there who disgrace the profession to which they belong, by throwing into their dirty coffers the money which is viciously and basely obtained from aspirants to the office of house-surgeon, - money which is cunningly enticed often from the most inexperienced students, at a horrible sacrifice of the welfare of the patients, and to the utter perversion of every principle of that pure benevolence to the existence of which the hospitals owe their foundation! In 81. Bartholomere's Hospital, for example, the office of house-surgeon is sold, solo, like an ox or a carr in the neighbouring market! William Lawrence has been one of the sellers, too, within the last year, and pocketed the cash which he obtained from the purchaser with as little remorse or shame as his brother traffickers on the same day bagged the produce of their cattle sales in the Smithfield pens. Shame. shame, that such practices should be perpetrated in a temple dedicated to the divine purposes of charity! In one institution, as our readers have recently seen,-in the hospital which belongs to the London University, -- the office of house-surgeon has not been converted into an object of barter, of odious and mercenary barter, but has been made a prize for successful intellectual ca petition. It has been conferred To its possessor, therefor -not the insignific

purchase, but those which belong to the strangelated hernia? Can they find the well-qualified and experienced members of the profession. But will it be believed that in Guy's Hospital there is no house-surgeon. either in name or in substance, and that a like deficiency also exists in the other great homital of Southwark, -- the hospital Thomas, - the two establishments commanding, at the same time, pecuniary resources amounting to, if not exceeding, the sum of one nundred thousand pounds PER ANNUM? Both hospitals, it must at the same time be remembered, are liberally stocked with physicians and surgeons, whose friends and relations in the medical corporations have so contrived affairs that the hospital functionaries are enabled to draw their salaries from the pockets of those medical students who have the misfortune to be the victims of the ticket-and-certificate system With only one hundred thousand pounds per annum, the funds of those hospitals are too poor to allow adequate salaries to be paid out of them to resident surgeons.

" Ah !" but some of the corrupt and pettifogging tribe will assert, " there is a resident apothecary in each establishment." True enough. So, too, there are resident pestles and mortars, resident mous and resident sponges -pieces of convenience which are as much at the disposal of the resident anothecary, as the resident apothecary is at the disposal of the non-resident physicians and surgeons. The apothecaries are, in reality, nothing more than pharmaciens.* They regulate the dispensing department, and in some instances of great emergency, prescribe, perhaps, a dose of rhubarb, or twenty drops of laudanum. But do the apothecaries operate in cases of surgery? Do they dare cut down upon and divide the stricture in cases of

The advantages which would necessarily arise from the appointment of a resident surgeon of first-rate abilities to each of our great hospitals, would, in the course of a few years, be incalculable. The sick poor would be efficiently treated, the students would derive perpetual opportunities of improvement from an ample supply of clinical instruction which he does not now possess the means of obtaining, and the facts and observations which practitioners thus favourably circumstanced must be enabled to re-

sheath of an artery, and tie the vessel, in a case of dangerous hemorrhage? Do they attempt even to reduce a dislocated limb. to adjust the divided ends of a broken bone. or relieve the brain, by means of the trephine or elevator, from the pressure of a piece of bone in a fractured cranium? In short, the anothecaries of our hospitals are the mere servants of the medical officers in matters of dispensing, although they probably go through the formality of an occasional walk along the wards, in order to report any newly-occurring peculiarities in the cases, on the arrival of their masters, who, being particularly industrious and attentive, generally contrive to visit the hospital at irregular hours on two days in each week. Such a system of management one could almost conceive to have been projected by some crafty wily undertaker, who, having engaged to execute by contract the funeral business of the hospital, saw that it would be rendered profitable in proportion to the number of "black jobs" which he should have to execute. That a mode of management so fraught with evil is on the point of terminating for ever, we are well assured, and although this is the best consolation that the mind under the circumstances we have stated can receive, yet an indemnity against future wrong-doing can have no tendency to mitigate the sorrows and sacrifices which the misgovernment of our hospitals has produced during so many successive genera-

^{*} We make no attack on the professional gracter of the gentlemen who hold the of resident apothecary in these estawe feel pleasure in stating Guy's Hospital, is not but that the busiexecuted with in-

cord. would contribute in a pre-eminent de- orrhea; and many, I am sorry to say, who have of our medical institutions are now conproper quarter, the worthy baronet expressed himself thus in the warm and stirring language of indignation and truth. We quote from his 54th Lecture on Surgery in Vol. 2, 1823-24.

"At the present time, however, a surgeon must be either grossly ignorant, or shamefully negligent of the duty which he owes to the character of his profession, and to the common dictates of humanity, if he persists in giving mercury for this disease Let those persons who suppose that gonorrheea can be cured by mercury, go round our wards and see whether mercury has any effect on that disease. Look, gentlemen, at 100 patients in our foul wards, many of whom come into the hospital with syphilis and gon- denounced the

gree to promote the general diffusion and advancement of the thoroughly investigated treatment of these patients? You are principles of medical science. As the affairs aware, gentlemen, that I scarcely ever enter the foul wards of St. Thomas's Hospital. When ducted, the responsibilities are so numerous, have the patient removed to the clean ward. from their being separated into so many divisions, that there is scarcely a more difficulty. The secure patients under gonorrhee are a particular case demands my attention, I cult task to be executed than that of tracing compelled to undergo so infamous a system of out those links in the chain of circumstances treatment that I cannot bear to witness it.

To compel an unfortunate patient to undergo which point to the source of a particular a course of mercury, for a disease which instance of management. Occasionally, in- does not require it, is a proceeding which deed often, it happens, that a patient is at-character of a medical institution. No contended by a physician, a surgeon, an apothe-sideration shall induce me to repress my cary, a dresser, and a nurse, each undertak. feelings on this subject; no authority shall ing to execute certain duties, but no one restrain me from giving full expression to those feelings. As long as I continue a suracknowledging that the responsibility of the geon of Gny's Hospital, I will endeavour to case rests on his own or her shoulders. When do my duty; but I care not whether I continue a surgeon of that hospital another day. I do Sir ASTLEY COOPER so ably filled the office say that the present treatment of putients under of surgeon in Guy's Hospital, he was so gonorrhua in these hospitals, by putting them much annoyed by the occasional interference for five or six weeks, is infamous and disof the physicians with cases of surgery in graceful. The health of a patient is, perwhich he had operated, that he was induced haps, irremediably destroyed by this treatment, and, after all, not the slightest effect to recalcitrate, and express his great annoy- is produced by it on the disease. If he is ance at the presence of some of the medical cured of his gonorrhoa at all, he must be officers who were dangling at his heels, and curred by other means. If you go to a patient with gonorrhoa in the foul wards at the not only interfering with, as that celebrated end of his course, and ask him how many surgeon has more than once stated in public, times he has rubbed in, he will generally but absolutely retarding and preventing answer 'Twenty-eight times.' If you ask the speedy cure of his patients. On one he spits three pints a-day; but ask him subject of abuse, where there was also a directly, 'No, I have the disease still upon me.' vision of the responsibility, arising entirely His disease is not in the slightest degree in consequence of non-responsibility in the affected by the mercurial course to which he has been so unpardonably subjected, and it will soon after be necessary to cure him by injections or other means. When so infamous a practice prevails, I cannot satisfy my own feelings by resorting to milk andwater language; every man of common feel-THE LANCET, Fourth Edition, page 192, ing and honesty is bound to speak out on such occasions.

It it impossible to read this language without entertaining respect for its author. The denouncement of the odious system was honest, bold, and unflinching. In this instance, when THE LANCET had existed only about six months, one of the first es sulting from the existence medical press, because ble. During tent "y

tem of poisoning patients with mercury.patients whose diseases required not one grain of mercury,-without producing the slightest effect on the ruling authorities of the establishment. At length the denouncement of the shameful abuse was published in this Journal, and along with it some strictures of our own, written in exact accordance with the views of the lecturer, and in less than ten days after the" infamous system" was made public, Sir Astley, at the conclusion of a lecture, thus addressed his rlass: -

" I believe much good has already resulted from my observations on the abuse of mercury, and I am happy in being enabled to state that the venereal wards of Guy's Hospital are about to be opened un-DER NEW AND IMPROVED REGULATIONS. I have spoken to the treasurer (Mr. BEN-IAMIN HARRISON), and I have the satisfaction of stating that the custom of making patients spit three pints a day will no onger be a part of the system, but that he venereal wards will be opened under NEW AND IMPROVED AUSPICES.

Private remonstrance in attempting to correct this horrible abuse of one of the nost powerful, and, at the same time, one of the most poisonous of our medicines, was itterly unavailing. Publicity, however, had he effect of shaming the ruling party, or parties, into the adoption of a rational sysem of treatment. We appeal to all the tudents who attended Guy's Hospital from he year 1816 to the year 1822, and we ask hem whether they ever witnessed more listressing scenes than were to be seen in shat were called the " foul wards" of that nstitution. Sufferings of the most dreadal description were caused by the use, the riminal use, of mercury, administered, in act, for the cure of a local malady over vhich it had no remedial power, but proluced, by its continued employment, often month and six weeks together, a train less frightful or destructive in han the very worst

terrible diseases

often been confounded, even by discriminating practitioners.

The calamities, therefore, that originated in the abuse which Sir ASTLEY COOPER SO feelingly and justly denounced, must, during so many years, have existed to a frightful But where was the RESPONSI-BILITY? Oh! it was divided. And, in reality, the distinguished complainant and surgeon was not responsible for the treatment of his own patients. There was a gentleman who ruled over the establishment. That gentleman was Mr. BENJAMIN HAR-RISON, and even that important functionary ought to have acted in conjunction with forty-nine associate governors.

Now, we put it to the common sense and the good feeling of the profession, and to the governors of Guy's Hospital, not omitting Mr. HARRISON himself, whether so destructive and cruel an abuse, attended with such unfortunate and fatal results, as the one named by Sir ASTLEY COOPER, could have existed for twenty weeks, instead of nearly twenty years, in Guy's Hospital, if there had been a resident surgeon in that establishment, and that surgeon had been made responsible for the proper, the scientific treatment of the disease with which the suffering patients were afflicted. Where there exist these mysterious and confounding divisions of responsibility in medical charitable institutions, there are always observable in them evidences of neglect or mal-treatment. Few or no facts are collected in them that may be added to the existing stores of medical knowledge; instances of proffered aid are regarded as so many uncalled-for interferences, professional jealousies are excited, and as each practitioner seems to feel that the credit of a cure cannot be the reward of his exertions. neither will the cause of death be attributed to his supineness or his want of ability.

But let us turn our attention from the frame, and with hospitals which are receptacles for the disease has sick poor, to the metropolitan institution of

health of whose inmates is regarded as an object of the greatest importance with respect to the high objects of moral and intellectual attainment. In this establishment ONE disease has continued its destructive ravages for a long series of years, not only uncured, but almost unrelieved or unchecked. In this single justance we observe all the mischiefs which arise out of injudicious appointments, in the first instance; and, secondly, from the impolitic division of responsibility amongst the medical officers. Since the year 1820, Dr. ROBERTS, Dr. CLEMENT HUE, Mr. ABERNETHY, Mr. LLOYD, and Mr. FIELD, who has lately resigned the office of anothecary, have been the medical attendants of the children; an I, in addition, there was, on one or two occasions, a visiting medical committee appointed, which embraced Mr. LAWRENCE, Mr. BRODIE, and others, the personal friends, and, for the most part, the colleagues, of the officers of the establishment. Who, then, is responsible for the ravages which the ringworm has committed in this establishment .- for the sufferings which the poor children have endured,-for the bodily restraints to which they have been subjected, -for the imperfect education of which they have been the victims? It will be answered, that the whole of the medical officers are responsible. Ay! When it is thus divided, the portion which each has to bear presses so lightly that it is scarcely felt to be an inconvenience, and even that portion is blown away by the mere breath of either officer who alleges "that he " could not cure the patients because the " medical management of the children was " not placed entirely under his control,"-a statement which is rendered perfectly justifiable by the circumstances connected with the duties of each of the medical officers. Disastrons enough have been the consequences. The undring Ringworm has pursued its course; the children have long on Friday the 23g been kept on a most unwholesome diet; the opportunity, the

CHRIST'S HOSPITAL the maintenance of the | unfortunate boys have been tortured by the endless application of plasters and unguents to their scalps: and, what is still worse, the mental soil has, in numberless instances, been left entirely unimproved and uncultivated. These facts are most lamentable, but there is one which is also most Atraordinary. The labours, the discoveries, the observations, of the medical officers of Christ's Hospital have not contributed one solitary page of information to our stock of knowledge on the subject of ringworm. So far as the labours of those officers are coucerned, the members of the medical profession in this country are just as wise on the nature and treatment of ringworm, as they were on the first day that that malady made its appearance in the institution. We say, therefore, fearlessly and unhesitatingly, that if a succession of resident surgeons,that is, supposing the first had failed or died,-had been appointed, no such omissions or results as those which we have stated, could have been observed or recorded.

With these views and impressions operating on our feelings, we look forward with the utmost anxiety and apprehension as to what may be the rules of management for the medical officers, after the coming election of a resident surgeon to Christ's Hospifal has terminated. It is of no use to appoint a competent practitioner, and then bind and manacle him. His mind must be left at liberty to act with the utmost freedom from the exercise of any controlling influence on the part of those medical officers who now belong to the establishment, and for whose talents and zeal the "undying worm" has proved itself to be more than a match.

This journal is published nominally every Saturday; but, in reality, it is inhands of our metropolitan reader day on Friday. The el to Christ's Hospital

last words to the governors on the subject of capable of curing the disease called "ringhave happened, particularly from a division hands of Dr. Roberts, Dr. Hue, Mr. Aberdidates for the vacant office are about wen tv in number, that is, if all can be called "candidates" who have issued letters of solicitation, without entertaining the hope of obtaining a single vote. From what we have been enabled to observe, we may state that the actual candidates may be divided into two portions; the one party baving the fullest and most substantial claims to the confidence of the governors; the other part consisting of persons who have no title to the respect of the electors, although, as regards confidence, it is quite evident that they possess enough of it-in themselves. candidates placed in the two divisions stand thus .- Mr. PLUMBE on one side, - a score of opponents on the other. Here, then, is a contrast presented by the claimants for the office, and it would be quite useless to institute a comparison, for there is in reality nothing to compare, unless the shadow be classed with the substance, -unless the inexperience of youth can be made to maintain a parallel with the matured knowledge of a twenty-years' assiduous devotion to the labours of an arduous profession. Some of the candidates, we understand, have been educated at St. Bartholomew's Hospital, but we will not do the governors the injustice to believe that even a thought will be entertained of taking another gentleman from that school to place him in the office of medical attendant in Christ's Hospital. No such folly, such pernicious folly, can be committed by rational and benevolent men. The teachers of St. blomew's Hospital may be men of exof first-rate ability in the ge profession, but the many years has they are in-

appointing resident surgeons to our hospi- worm," - that the suffering children of tals generally, and of the mischances that Christ's Hospital have received from the of medical responsibilities, in the institution NETHY, and Mr. EUSEBIUS LLOYD, (the over which we know it is their desire to present consulting surgeon of Christ's Hosexert an efficient salutary control. Tite can pital), who all have been, and still are, lecturers and practitioners in St. Bartholomew's Hospital, little or no relief from the persecuting malady with which they are afflicted. All of these gentlomen have held office, have been consulted, or are still holding office, in Christ's Hospital, and their efforts in the attempt to cure the heads of the afflicted children, have been utterly and signally unavailing. The masters, the instructors of youth, have failed, and shall it be said that the apprentices, the instructed, shall be selected, in the hope that inexperienced youth can accomplish, in the treatment of disease, obstacles which are not to be surmounted by the ripened knowledge of experience and age? No such selection can be made by the governors. A choice of that kind would, in reality, be little less than a solemn mockery of the complaints which have been so loudly made by the parents and guardians of the distressed and tortured children. There may be amongst the governors two or three mischief-makers who may be swayed in their choice by the interests of party, rather than by the dictates of reason, and whose love of intrigue may be superior to that of works of benevolence; but confidently assured are we that an overwhelming majority of the governors will be influenced in the selection of a candidate by an carnest, noble, and generous desire to spare the interesting objects of their solicitude every torment which can be averted by the judicious exercise of medical skill. No conideration of a less rational or humane tendency can by any possibility determine the hoice which is about to be made by a large ody of indepen 'ent English gentlemen. They ere called upon to act as parents on this occaion, for the children are placed entirely under their guardianship. On reflection they must

perceive that it is their paramount duty to get rid of the scourge which has so long pestered hundreds of the scholars, and in furtherance of that duty we now once more earnestly express a hope, THAT THE GO-VERNORS WILL NOT BE INDUCED TO ELECT THE RESIDENT MEDICAL OFFICER FOR A LONGER PERIOD THAN ONE YEAR. Whatever may be the entreaties of the candidates. or the petitions of their friends, THIS LIMIT, relative to the time of holding the office, SHOULD BE RESOLUTELY FIXED, and not departed from under any pre; ence whatever, At the end of the year, if the state of the children do not indicate that a confirmed progress towards the improvement of their health has been made, the surgeon who has been allowed a twelvemonth's trial, should instantly give place to a successor in his office. In acting with decision and promptitude, the governors discharge no more than their duty towards the children; whereas if their conduct be marked by the slightest evidence of supineness in matters of such vast importance as the health and education of the pupils they cannot justly be excused from an accusation of culpability.

In contending for the superior claims of Mr. PLUMBE, we trust that the character of this Journal will fairly permit us to refrain from remarking that we are influenced by no partial or unworthy motive. He has proved by his published works, by his success in the important medical offices which he has already held (those of senior surgeon to the St. Giles's Infirmary, and of senior surgeon, for many years, to the Metropolitan Infirmary for Children), that he is capable of maintaining a first place in the rank of medical practitioners, and that in his knowledge of the nature and treatment of diseases of the skin, his superior is not to be found amongst the physicians and surgeons of this metropolis. His claims to the Governors of Christ's Hospital. favourable opinion of the governors are founded on his talents and experience. His title to the support and recommendation of Thursday, Octob this Journal has an other foundation

The duties of the Governors, with regard to the medical care of the children, must not terminate with the appointment of I . PLUMBE. After he has been installed in his office, that gentleman must be left free to act. He must not be hand-bound. He should be entrusted without restraint with the care of the health of the children, which would necessarily place their medical and dietetary management under his control. With such an arrangement there would be no shifting of responsibility. If the mode of treatment should fail, the Governors will at once be enabled to trace the failure to its right source, and other professional aid must be sought for and obtained. It is high time that all forbearance or dalliance with such an insidious and destructive foe as the ringworm should terminate. From the number of communications which we have received on the subject of this election, we know that the parents and guardians of the children are awaiting, with the most intense anxiety. the result of the contest. A respectful and generous reliance is bestowed by their relatives on the judgment and benevolence of the Governors; and as for the afflicted children, their hands are raised towards their benefactors in pitcous mood, expressively, though silently, hoping that the hour of redemption from their prolonged sufferings is at last drawing near. They who can remain unmoved in the presence of such a scene, and who can suffer their judgment or their motives to induce them to vote for the candidate whom they do not believe to be the best qualified and the most capable to protect the scholars from the further destructive ravages of the disease, must have their feelings steeled against all the finer sympathies of human nature. We hope and believe that persons of this description are not to be found amongst the benevolent

A letter appear " Christ's West

the writer observes,-" In the London es-" tablishment, the disorders affecting the >" scalp, formerly so troublesome, have, I " understand, disappeared." Disappeared! Why not say cured, if such be the fact? But is it not strange that Mr. BENNINGTON, the incdical attendant of the branch establishment at Hertford, should undertake to give an account of the state of Christ's Hospital in London? The time has been conveniently chosen for writing this delusive canvassing letter; but we feel confident that the Governors are not to be deceived by any such efforts, and that on the day of election they will conscientiously and honourably record their votes in favour of that man who by his researches, his experience, and the devotion of a great portion of his professional life to the consideration of the diseases of the skin, and who, by his discriminating and prudent recommendation to the Special Committee of Christ's Hospital, has proved that he is pre-eminently qualified to occupy the office of resident surgeon in that great national establishment.

It is a enrious fact that Mr. JEAFFRESON, of Framlingham, in a letter which was published in THE LANCET of March the 14th, 1835, page 872, while speaking of the qualifications of Mr. Bennington, who bad been his apprentice, refers, in proof of the first of those qualifications, to the fact that during his apprenticeship Mr. Bennington had " read the works of Plumbe on the history and treatment of ringworm." The governors of Christ's Hospital have now the opportunity of choosing between the PRE-CEPTOR and the PUPIL. To suppose, for one moment, that they would prefer the latter to the former, while yet Mr. PLUMBE is carcely forty years of age, and therefore in rime of life, would be anticipating that s would display a perverseness suld indicate to the that all lay inter-

sections of our

"ROBERT BENNINGTON." In this letter public institutions skilled cease and be

THE contest for the office of surgeon in the parish of St. Clement Danes, after the votes had been recorded by ballot during three days, terminated on Wednesday last, in the election of Mr. Cosgreave, by a majority of 103 votes over his opponent. We do not blame Mr. Dunn for having offered himself as a candidate on this occasion, but we condemn the principle by the advocacy of which he endeavoured to sustain his claims to the confidence of the rate-payers. On every account we rejoice in the election of Mr. Cosgreave, because we are satisfied that he has discharged his duty to the poor with humanity, industry, and skill; and better proof of this assertion cannot be offered than the fact that although our office is in the centre of the parish, and situated within two hundred yards of the workhouse, not a single complaint against the parochial surgeon has been made to us in the course of the nine years during which Mr. Cosgneave has filled the situation. If such a man is to be rejected because another person thinks that he ought to occupy the post, there would be an end to the respectability of the profession, to the humane treatment of the poor, and to the stability of all useful and efficient reforms.

We regret that we have not space in the present LANGET which will allow of our offering a few additional words to the "recognised" lecturers. They contend that we are unjust in our remarks, and that the existing system is not one of robbery and delusion. We must appeal from their vorbal decision to the experience and feelings of the pupils. By some of the lecturers our opinions and views have been wholly misrepresented. We thank them for their false-hoods.

The Anatomy of the Regions interested in the Surgical Operations performed upon the Human Body, &c. In a series of Engraved Plates, on India Paper, the size of Life. By J. LEBAUDY, M.D. London: Balliere, 1835; 4to, pp. 32.

WE cannot consider the present volume (which is priced at the sum of one pound four shillings), notwithstanding the freshness of its title and appearance in some parts, to be any other than the atlas of the Journal des Connaissances Medico-Chirurgicales, which is sold at the bureau of the journal, Rue de l'Ecole de Médecine, next door to the Hotel Herisson, for the much more modest sum of six francs. M. Lebandy is an excellent artist himself, and his plates have been designed and engraved with much accuracy by some of the best artists in Paris. We have, therefore, no objection to make must protest against the high price which the immense circulation which it has obinadequate price at which it was originally published,-five shillings per annum. It is, therefore, not very unlike an imposition to take the atlas of that journal, paste the words "Published in London and Paris by J. B. Bailliere," over the real title of the plate, and sell it, with thirty-two pages of description, at such an unconscionable increase on the original cost. We should certainly advise a reduction in this respect, and also in another, that of the number of the plates, for instance, plate 18, which, though suitable enough in the journal that originally contained it, is misplaced in a work on surgical anatomy.

On Blood-letting.—An Account of the Cura-tive Effects of the Abstraction of Blood; with Rules for employing both Local and General Blood-letting in the Treatment of Diseases. By JAMES WARDROP, M.D., Surgeon to the late King, &c. London. Bailliere. 1835. post 8vo. pp. 148.

THE lectures on the above subject, which were made public some months since by The original of this translation their eminent and experienced author in for several years before the pages of THE LANCET, clicited expressions of admiration from the most intelligent medical practitioners in all parts of La Chapelle,

the country, not only in consequence of the novelty of many of the doctrines which were then enforced by Mr. Wardrop, but also from the philosophical views and the strictly physiological and pathological principles on which his opinions were founded. The extensive practice which naturally attends the professional fame of an able and accomplished surgeon, speedily affords in gratifying opportunities of learning the extent of favour with which his published doctrines, far and wide, have been received. Prompted, therefore, in the present instance, by an assurance of the feelings of interest which his labours in diffusing a correct knowledge of the principles of bloodletting have excited, the author has here combined, in a series of uninterrupted pages, all that he had to communicate on the subject, with something in addition, as we learn against the surgical value of the work, but from the preface to the edition before us, with a quotation from which we shall be has been set on it in an English dress. We content in noticing the volume, for farther know that the Journal des Connaissances owes extract would be useless on an occasion in which the author has simply strengthened tained in a short time, to the cheap and the arguments, not cularged the opinions. he had previously employed : -

" Embracing some of the most important subjects of discussion in medical science. the following observations were not sidemitted to the profession without the exercisc of much care and deliberation; and the favourable reception which they obtained has induced the author to collect and publish them in the present form. In accomplishing this labour, however, he has not tailed to use his best endeavours to render the work more comprehensive, by dwelling at greater length on some points, and by giving additional cases illustrative of several interesting topics .- Charles Street, St. James's Square, October, 1835."

The volume is most conveniently indexed by side-notes in each page.

A Practical Treatise on the Diseases of the Uterus and its Appendance &c. By Madame Boryrs and V Drers Translated, with copions notes, by G. O. HEMMING, &c. London: Sherwood, 1834; 8vo, pp. 559, plates.

Nothing so cheap in the sisted by Monsieur La Duges of Montpolier, way of information has yet come from the who, by-the-by, composed a great part of press. Each plate of the seventy in these two the late Madame La Chapelle's work, also, A volumes is coloured, and with remarkable good standard treatise on the diseases of fidelity. An exception exists here and there females was always a desideratum, not only in the portraiture perhaps. In the "wood in this country, but in most of the con- pigeon," for instance, we detect one, but the tiental states; indeed we cannot say that faults altogether are very rare. A memoir the want is yet satisfied, unless we allow, of Werner is prefixed to the volume on with some physiologist, whose name we Butterflies. The selection of the biography forget, that " the uterus makes the wo:nan." of this philosopher to enlarge the bulk of a Were the latter proposition true, Madame work on butterflies is somewhat odd. The Boivin's work would be almost perfect, for man of rocks and metals seems to preside nothing can exceed in fidelity her descrip- heavily over the memorials of such feathertion of the natural structure of the uterus, weight objects. Werner, however, had one and the various murbid changes to which thing in common with as great a man in the that organ is liable. However, as she pro-clatter way. As the enthusiasm of the latter fessed to confine her attention to diseases led him to believe that butterflies carried of the uterus, we cannot reproach her for language on their wings,-for he desired his mistress, when they crossed her path, to read thereon words of affection from himself, - so Werner fancied "that stones could ticing the present translation in detail, by speak," and demanded from them the histhe copious extracts which have been already tory of the whole world. Such, indeed, long given from the original. We shall was his notion of the science, that he even, therefore content ourselves with again re- says Cavier, " endeavoured to trace the peating that the work of Madame Boirin laws of military art to those of geology, and and Monsieur Duges on the diseases of the if his account was to be received, every geneuterus is indispensable to the library of rul should have commenced his career by every practitioner; and that Mr. Hemmins studying for some time at Freyburg," where has shown a sound descrimination in ren-Werner held the post of professor, and indering it into our own language for the ad-spector of the cabinets. It is only these

> There is a very curious fact in the history of Werner, which is worthy of being noted among men of science. He wasted no time over pens and ink. He constructed no manuscripts for the diffusion of his fame. He left the simple facts which he discovered to work their own way, as they could, into general circulation. It was enough for him to detect them, and divulge their existence by word of mouth. He would not write. He hated the scribbling art with an intensity unmatched,-with an abhorrence so great, that it is hardly unreasonable to ask if he knew "the way," while the curious may ask with laudable eagerness to see his autograph, if he ever left one.

The following extract from the Eloge, pronounced by Baron Cavier before the quire to be seen University of France, will be read with inensured to terest, not only from the singular details which they which it contains relative to this circumstance, but from other characteristic acts need, his purse supplied their wants. When which are calculated to engage the attential last audience became too numerous for each tion of the readers of a work of tuition. Whatever is not new in this account is the lecture. His door was at all times open worth reviving :-

"Strangers who happened to visit Werner at Freyberg, and expected to enter into conversation with a mineralogist only, were surprised at his continual discussions on tactics, politics, and medicine. They were sometimes tempted to regard them as allied to the reveries of a maniac. Indeed, we may admit that there must have been something of exaggeration in generalizing to such an extent the relations of a single object; enthusiasm upon a field of inquiry which he described to them as so vast and fruitful as to embrace all these topics. A mineralogy which was purely mineralogical, would perdevoted themselves with ardour to a mineralogy which seemed to present them with a key to all nature : and even although, on a final analysis, there might only remain to them the foundation of the science, would they not still have reason to rejoice at the pleasing illusions which had been the means of leading them thither? Some individuals who have since risen to the first rank among the mineralogists of Germany, had wished to hear him, only for the purpose of obtaining a summary knowledge of mineralogy; but having once listened to him, that science became the profession of their lives. It is to this irresistible influence that the scientific world has been indebted for those laborious observers who have removed from the globe the last veil that concealed her mysteries. Karsten and Wiedman in the cabinet-Humboldt, Von Buch, Daubicisson, Hermann, and Freyensleben, on the Cordilleras, amidst the flames of Etna, in the deserts of Siberia, in the mines of Saxony and Potosi -have been led on by the spirit of their master. They always ascribed to him the honours that resulted from their labours; and it might be said of him, what could formerly be said with truth of Linnaus only, that nature was every where interrogated in his name.

"Few masters have enjoyed in the same degree the pure and unreserved gratitude of their scholars; but no one, perhaps, had ever so much deserved it by his paternal regard for them. There was no sacrifice which he would not make for his pupils. His time he would not make for his pupils. His time fluence on the and strength were at their service; and if accommodated. he knew that any of them were in temporary | ties, eager

to see conveniently the objects which he ex-hibited, he divided the students and repeated to them; he took his meals usually with some of them, as if he wished that no opportunity should be lost for their instruction. Such a master might well entrust the care of his reputation to his scholars; and G is, in fact, by them that it has been established. In this point, also, resembling Socrates, to whom he has been compared in so many other respects, nothing can be known of his views but from the notes that have been taken of his lectures. Whether it was that he became satisfied with the ascendancy which he acquired by his powers of speakbut the disciples of Werner hurried with it g, or that the vivacity of his imagination coald not submit to the restraint and tediousness of writing, it was only with the greatest difficulty that he was induced to prepare for the press one or two pamphlets and a few articles for the journals, though haps have disgusted many of them; but they he engaged in oral discussions as readily as could be wished, and for hours together would atter the boldest and best-connected ideas. Nothing, however, could make him take up a pen. His antipathy for the mechanical act of writing, was rendered amusing by its very excess. His letters are extremely few. The tenderest friendship, the most profound esteem, could scarcely extort one from him; and at last, in order that he might not reproach himself for his want of politeness, he ceased to open such letters as were sent to him. One author, who was desirous to have the opinion of many scientific men respecting a voluminous work, circulated his manuscript among them. During its progress the packet was lost. After a thousand researches, it was at last disinterred from under a hundred others in the house of Werner. To carry this matter to the extremity, he did not even reply to the French Academy when it placed him on the list of its eight foreign associates, which is adorned with all the great names of which Europe has been able to boast for more than a century. Perhaps he did not even know that this honour had been conferred on him, unless he chanced to learn it from some almanack. This insurmountable antipathy to writing caused him to infringe the laws of etiquette, which next to his studies affected him most. In everything else he is said to have observed the slightest courtesies of social life with as much punctuality as he attended to the varieties of minerals. His little eccent ties, at which he was the first to am in no respect unpleasant in whatever is most cle amiable in disposit

w. b. 1.7

by attending to his foibles. But these peculiaritist posterity has to lament, as they have thereby been deprived of valuable works, which no one else for a long time can execute so well. It is said that the first sheet of his great work on mineralogy was sent to press, but that he could not underso the fatigue of correcting the proofs. His whole life was thus spent in ignorance of all that was going on at a distance, without reading the journals of literature, and without even ascertaining whether envy had occasionally made him the object of her attack. His life might have been expected to be prolonged for a considerable time; for of all the methods which he had studied, that of taking care of his own health had not occupied him least. But the misfortunes of Saxony escaped his foresight, and destroyed his peace, and his resulting anxiety produced a complication of diseases, to which no care could administer a remedy. He died in the arms of his sister, on the 30th of June 1817, aged 67, at Dresden, whither he had gone in the hope of some alleviation of his sufferings."

The Cinique Médicale, or Reports of Medical Casee. By G. Andran, Professor to the Faculty of Medicine, &c. Condensed and translated by D. Spillan, M.D., &c. London. Renshaw. 1835. 8vo. Parts 1, and II.

WE recommend this translation as a production which presents two advantages that are not often found in combination in medical works. In the first place the original (which, as we have before said, is too well known to require comment) is the best system of medical pathology extant; and in the second, the translation, which seems to be executed with accuracy and care, is moderate in price. Generally speaking, the English translations of foreign works are published at unreasonable prices. Their circulation is thus necessarily limited, and the good example of many excellent continental works prevented from exercising the influence on medical literature and practice which it is desirable that it should obtain. The price of this translation will. when it is completed, hardly be higher than

the will centend that a transtensisted.

produced with accuracy,

of the original, and he must be a hardy

Observations on the Principal Medical Institutions and Practice of France, Italy, and Germany, &c. With an Appendix on Animal Magnetism and Homospathy. By En-WIN LEE, M.R.C.S., formerly House-Surgeon to St. George's Hospital. London. Churchill. 1835. 8vo. pp. 216.

THE contents of this volume are justly described in the preface as presenting " an impartial and not inaccurate sketch of the actual state of medical and surgical practice in France and Italy," with some " notes on German Institutions, less copious, but calculated to convey some idea of the state of practice in that country." The author might have given other qualities to his sketch with advantage, because the great bulk of his matter is not new to this country; but he does not seem to be a gentleman of much originality or expansiveness of view, or one who is likely to handle an old subject, or newly arrange the points of a stale topic, in a more vigorous or attractive manner than his predecessors, and we willingly excuse his abstinence from the attempt. He would certainly have failed in the effort. His dedication, however, of a volume devoted to an exposition of the free medical institutions of the continent. to one of the most narrow-minded andilliberal functionaries of the close hospitals and colleges of Great Britain, was a mistake of which he should not have been guilty, and certifies very early in the book more respecting the deficiencies in its character than there is any occasion to denote here. Even as it is, Mr. Keate must have received his copy of the volume as a diseased child receives into its unwilling hand a cup of detested rhubarb. But impartiality and accuracy are excellent qualities, and having said thus much respecting the absentee virtues. we express contentment with the labours of Mr. Lee in that respect. His volume will prove useful to medical students who visit the continent, and afford them a fair extent of introductory knowledge respecting the institutions which supply the means of professional learning in the quarters specified. Scattered through its pages we find

^{*} Mr. Lee's grammar cannot be much praised. How many languages are studied by Englishmen in preference to their own! "German institutions" do not constitute a "coustry." Such blunders are frequently

150 was impossible to flidge. In confirmation of this, he alluded to the case of a girl who had been received into Guy's Hospital, while the catamenia were present, and which were arrested suddenly by the affusion of cold water, followed immediately by a severe attack of pleurisy, attended with numbress and cedema of the inferior extremities; but so soon as the uterine disturbance was corrected, the pleurisy and other symptoms induced by the arrest immediately disappeared.

Dr. JOHNSON adverted to the fall which the patient had received, and said he had requested the advice of an eminent physicianaccoucheur and pathologist of this metropolis, whose letter in reply to that of Dr. Johnson was read, but it simply and briefly attributed the sufferings to spinal disease.

The PRESIDENT (by the special request of Dr. Johnson) gave his opinion on the treatment; he suggested that perfect rest for months should be enjoined, and that a nourishing diet should be allowed, and anodyne injections used; but during the time the catamenia were present, he would strongly recommend that the patient should move about, as a sluggishness of the uterine functions at that time, he had found, greatly contributed to increase the debility. He could easily conceive why the stimulating preparations of iron had not proved beneficial. These he never prescribed under similar circumstances, for he had found that such stimulants naturally increased the irritation, and thereby kept up the pain, suffering, and disturbance. The same objection, however, was not to be urged against the diffusible stimuli, and from the carbonate of ammonia, rendered palatable to the patient, he had derived in his practice great benefit as a stimulant.

Dr. RYAN, in addition to this treatment. recommended small doses of strychnia, and the introduction of metallic sounds into the uterus; in the use of which instruments he had seen much benefit derived when cautiously introduced into the uterus, commencing with small-sized bougies, and gradually increasing them; for while the patients were suffering from dysmenorrhoea, he had ascertained by examination at the time, that the parts were much contracted.

Mr. CLARKE observed, that whatever merit attached to this plan, was due to Dr. Macintosh, who introduced the practice.

Mr. Costello remarked that this formed one of the improved plans of treating urethral diseases, which he hoped shortly to lay before the Society.

Mr. STRETTON then exhibited to the Society some diseased preparations of fungus hæmatodes, attacking different structures in the same individual, and the Society shortly afterwards adjourned.

LONDON UNIVERSITY MEDICAL SOCIETY.

Oct. 16, 1835, Mr. Chippendale, President. MOLLITIES OSSIUM.

(From a Correspondent.) - A paper on mollities ossium was this evening read to the Society by Mr. PIPER, and followed by an animated discussion, in the course of which several theories on the pathology of the disease were advanced. Mr. Haymes thought that proof that phosphoric acid was superabundant in the system, had been afferded by analyses of the bones of persons who had died from this disease, and that their insoluble phosphate became by this means converted into a soluble superphosphate, which was thus, with much greater facility, removed, by the absorbents diminishing, more or less rapidly, the quantities of earthy material. Mr. PACKMAN advanced an opinion that the disease arose in conscquence of deteriorated function of the periosteum, its arteries having lost their healthy secerning power, while the absorbents still continued to remove the portions of earthy matter that had already been deposited. Mr. BRENT endeavoured to follow up this view, and supposed the reason of the periosteum being unable to secrete a healthy deposit (in cases where immense quantities of common salt had been habitually swallowed by the patients, as has been said to have frequently been their custom) to be either the result of sympathy with the stomach and other organs of digestion, so greatly debilitated by the salt, or else that the salt itself soon became absorbed into the circulating fluid, and re-acting upon the phosphate there, as well as on that contained in the osseous structures, produced two partially soluble salts, the phosphate of soda and the muriate of lime, which were immediately taken up by the vessels. He added that the disease might, on the other hand, arise from deficient acton of the kidney, that organ becoming unable properly to separate the salts from the blood, which, by accumulation, would have the tendency of giving rise to the soluble salts. The phose urine, he argued, was a sufficient that the urinary organs we turbed. Messrs. Kause and other gentlemen ject, which courted

until the perio

NORTH LONDON HOSPITAL.

CARIES OF THE OS CALCIS.

AMELIA CALLOWAY, aged 17, was admitted, May 12, under the care of Mr. Cooper. About three years ago a swellin appeared under the ankle of the right leg on its internal side. Sometimes it was very painful, but she continued to move about until the week previous to her admission. Some time last March the swelling broke. She had experienced a little relief at a dispensary, until a short time before her admission, when she got much worse, and her general health suffered considerably.

14. Pain so violent in the ankle that she cannot sleep; poultices have been con-

stantly applied to the swelling.

June 20. She has been more free from pain since the last report, but has complained occasionally of sleepless nights. She has been taking small quantities of iodine, which, depriving her of her appetite, was discontinued, and sulphate of qui-nine, with infusion of roses, was given instead. On introducing the probe into the sinns, it is felt to penetrate deeply into the cancellous structure of the os calcis-

Aug. 1. Mr. Coopen being out of town, Mr. Liston to-day removed a portion of the os calcis with a small trephine, scooping out a portion of the cancellous structure of the bone. The part was stopped with lint, and

a poultice was applied.

Sept. 21. A small piece of bone exfoliated a month ago, since which time the wound has been gradually healing, and is now

nearly closed.

Mr. Liston remarked on this case, that the disease was most frequent in the heads of bones and in short spongy bones. also sometimes occurred in the cancelli and shaft, and in flat bones, between the tables. The cause of the disease was external injury and incited vascular action; suppuration in the cancellated texture frequently following very slight incited action in persons of a scrofulous habit. Great suffering generally is experienced during the progress of an acute abscess to the surface. An enlargement usually cusues from the addition of new bone, which is arranged in nodules on the outer table, and sometimes extends to the bones which are articulated with the bone that was diseased. There is one more closes leading to the ulcerated

the discharge proceeding from which filage. The os cal-the disease, pro-

sometimes commenced in the bursa, sometimes in the substance of the bone. varies much in extent and degree. The softening and disease are not always limited to one bone, but affect the synovial apparatus between the astragalus and the other bones. The prognosis is various, according to the extent of the disease.

In treating this complaint, Mr. LISTON rcmarked in continuation, that it is necessary to remove partially or entirely the part diseased, or to bring on such a change of action as will throw it off. The first object may be accomplished by trephining, as in the case in question, by scoops, saws, or forceps; the second can be effected by the potential cautery, the red oxide of mercury being generally preferred by the lecturer. Mr. LISTON exhibited several specimens and drawings from various cases, showing the different kinds of the disease.

DISTRESSING BICKNESS CURED BY CREOSOTE.

Dr. Elliotson, in a late lecture, related the following case, which shortly since occurred in his private practice. Mrs. P., a lady, residing near town, when apparently recovering from an attack of sore throat, was seized with incessant retching and vomiting, accompanied with debility and depression, both of mind and body. This distressing state continued for a week, during which period no food of any description was retained in the stomach. There was no pain on pressure, and no other inflammatory symptom. Wine, brandy, and even soda water, were all immediately ejected. The pulse was extremely feeble, and almost imperceptible, and she had frequent fainting fits. Two grain doses of hydrocyanic acid. though repeatedly administered, had an effect in stopping the vomiting. She was supported during the week by nutritive glysters containing white of egg and milk. It was after a week, during which the above symptoms continued undiminished, that Dr. ELLIOTSON was requested to see the patient. He ordered her two minims of creosote. to be given every two hours, and increased if the sickness continued, but to be diminished if it ceased. The first dose was thrown up, but a second, administered immediately after, remained on the stomach. The next dose, given in two hours, came up. Another was administered and retained. The vomiting had entirely ceased on the next day, without any increase having been made in the dose of the medicine, which was therefore now diminished in quantity, sed fetid. The soft parts around and, shortly after, entirely discontinued. ensed so as sometimes to The patient rapidly recovered, and is now in good health. Dr. ELLIOTSON has had repeated opportunities (besides the cases already published in THE LANCET) of tryis points; it ing the effects of creosote in vomiting, but as the details would present mere repetitions, we refrain from giving them. The medicine has certainly sustained in his hands a high character. The judicious directions, however, which Mr. TAYLOR affixed to the cases published by that gentleman in a recent Number of THE LANCET, should be carefully observed by those who make trial of the crossote.

LITHOTOMY.

Thomas Smith, aged 61 years, was admitted, Oct. 15, under the care of Mr. Lis-TON. He has manifested symptoms of stone from infancy, the most marked symptoms being a pulling at the prepuce, and violent pain while making water, which dribbles from him, soiling his clothes. During the time of micturition he is very restless, tossing about in every direction. These symptorus very much increased as he became older. Mr. LISTON having sounded him and detected a stone, the boy's friends being anxious that the operation should be performed immediately, he was cut on the day of admission. The boy being held between the knees of an assistant, a small curved staff, with a groove a little on one side, was introduced, and held firmly by another assistant, towards the arch of the pubis. The incisions were made in the usual way with a common dissecting scalpel, and the bladder was reached. The staff was then withdrawn, and the stone extracted with a small pair of forceps in forty seconds from the first incision. On the 21st he was doing exceedingly well.

OPERATION FOR CATARACT.

Margaret Lake, aged between seventy and eighty, presented herself at the hospital on the 15th of October with cataract of both eyes. Mr. Liston operated on the right eye, the pupil being previously dilated, by dropping in a little solution of extract of belladonna. Having covered the left eye with a bandage, he made steady the right one with his left hand (Mr. L. frequently impresses on the pupils the necessity of practising with both hands alike, as, for instance, in this operation on the left eye, in cutting for fistula ani on the right side, and various other operations), he then introduced the cataract-needle with his right hand, about a line or so from the junction of the sclerotic coat with the cornea, and reclined the cataract, gently disentangled it, and withdrew it cautiously. The eyelids were then closed, and a small piece of lint dipped in cold water, and a bandage, were applied to the eye. Mr. Lis-TON remarked, that in the generality of cases this was the preferable operation.

ST. BARTHOLOMEW'S HOSPITAL.

OSTEO - SARCONATOUS TUMOUR OF THE LOWER JAW — OPERATION — EXCISION OF THE BONE.

Ox Saturday, Oct. 17, an interesting-looking girl, of about sixteen years of age, was led blindfolded into the operating theatre. On being secured on the table, the disease evinced itself by a tumefaction in the situation of the left side of the under jaw-bone. Mr. STANLEY intended, in accordance with the joint approval of his colleagues, to remove the morbid growth by extirpation of the diseased bone. He commenced by an incision extending from the symphysis of the chin to the articulation of the jaw, on the left side, in a curved direction, according with that of the shaft of the bone. On refleeting the integument, the external facial artery was wounded. This was secured by Mr. LAWRENCE, who assisted the operator, who then proceeded to dissect cautionsly through the buccinator muscle and the coverings of the maxillary bone, about an inch inferior to the duct of the parotid gland; in accomplishing this, several small branches of the external maxillary artery were divided, and successively secured by the assistant. After carefully exposing the whole shaft of the bone to above its angle, Mr. STANLEY separated the muscles which were attached to its inferior margin as well as its internal surface, by means of a common scalpel; and having thus cleared away all the soft parts, the morbidly enlarged bone formed a conspicuous object. At about a quarter of an inch on the right side of the symphysis, Mr.S. commenced to saw through the jaw-bone with a small straight saw, and after making a groove in it, the short bone forceps were applied, but ineffectually. On exchanging them, however, for others with longer handles, the bone was at once cut through. A similar process was adopted at the angle, with the same success, and the detached portion of bone was then removed by separating the lingual and other muscular branches which confined it to the soft parts in its neighbourhood. After securing a few bleeding vessels, and cleaning the parts adjacent to the face and the wound, the edges were approximated, and confined by means of three sutures and some strapping. The poor girl hore the operation with admirable fortitude, though it lasted more than half an hour.

After the removal of the patient, Mr. STANLEY came forward and stated that the was a case of osteo-sarcoma, original the cancellous structure of the island by the cancellous structure of the land that and internal surface.

tion. He did not consider this morbid de- | on the left side of his face and nose. Durvelopment to be of a malignant nature, inas- ing the two last years the swelling and pain much as it wanted those symptoms which of the part had increased, and several miusually attend that class of diseases. Some nute portions of the bone of the antral cavity practitioner, who had visited the patient in the early stages of the disorder, plunged a knife into the tumour, but no bleeding resulted, nor did the formation of the tumour cause any pain or constitutional derangement. Still, however, it was desirous in these cases to practise extirpation, in consequence of the rapid growth of this fungus, and the displacement of parts occasioned by it.

A section of the morbid parts was made, and the specimen handed round to the pupils. It presented a fibrous structure, of a radiated form, including in its interstices a matter resembling albumen. The patient is doing very well.

STRANGULATED FEMORAL HERNIA. -Mary Bradshaw, ætat. 59, whose appearance rather indicated the age of fourscore years, was brought into the hospital on Sunday the 6th of September, for the relief of an incarcerated femoral hernia, which had been in a state of strangulation for a period of ten days.

Mr. LLOVD, considering all the circumstances of the case, determined to operate at once, and therefore at once resorted to the knife. On an expose of the contents of the sac, the intestine was ascertained to be in a state of gangrene, and adherent to the mouth of the crural ring. Under these prejudicial circumstances, it was determined merely to divide the stricture and permit the mortified gut to remain undisturbed in the sac. The edges of the wound were therefore approximated, and the nationt was removed to bed. with, however, an exceedingly unfavourable prognosis. The pulse gradually degenerated, and on the succeeding Wednesday evening, although braudy, carbonate of ammonia, strong broths, eggs, &c., were liberally supplied, the patient expired. On a post-mortem investigation the peritoneum exhibited decided evidence of inflammatory action having pervaded that tissue; the strangulated intestine was in a state of complete sphacelus, and had become adherent to the interior of the sac and the mouth of the ring.

ST. GEORGE'S HOSPITAL.

is disease was admitted into time since, under the Eight years previous was stated to d been bruised

were discharged at different periods through the left nostril. The treatment of the case was very simple. An opening was made through the superior maxillary bone over the alveolary processes into the cavity of the antrum. A probe was introduced, and dead bone was felt. The day after this operation the man was in a high state of febrile delirium, which was subdued by rest and antimonials, combined with Dover's powder. During the man's stay in the house, Sir B. BRODIE (at the request of his pupils that he would render the case one of instruction) made the following clinical observations thereon :-

" Here, then, gentlemen," he remarked, " we have an instance of injury of the face : at the end of eight years afterwards, portions of dead bone are discharged from SPHACELUS OF THE INTESTINE. - DEATH. the neighbouring parts, and, I may add, that they will certainly continue to be discharged for some time to come. This case leads me to speak to you of diseases of the antium generally, and to draw your attention to the present patient, whose circomstances are interesting to the surgeon. No clear account is given of the diseases of the antrum by surgical writers.* cases are rare; I have, however, seen several instances of inflammation of the superior maxillary bone. I believe that in these cases the inflammation is not dependent on local causes, but is produced and caused in the same manner as rheumatic inflamma-

"Inflammation of the lining membrane of the antrum may terminate in supporation. The cavity of the bone may be transformed into an abscess, and pus may be discharged. I conclude that such must have been the case here. Generally, when the disease runs to this height, the cause is local, and is frequently to be found in a diseased tooth. A person has a bad tooth, a malar, a cuspidatus (if the fang he large), or a bicuspis. He does not like to lose it, and he puts up with the pain and inconvenience until the pulp of the tooth becomes dead and irritates the membrane lining the alveolus, like a piece of dead bone, sooner or later. Inflammation and suppuration take place, and the matter does not escape. It may present under the gum, but sometimes it is lodged at the bottom of the alveolary socket. The bone above is absorbed, the periosteal lining of the alveolas, and the membrane lining the antrum, ulcerates; the bone becomes dead, matter collects in the cavity, and the patient suffers great torture. When the antrum is affected, there is a dull constant sense of pain over the part, with lancinating

Some of them will stare at this.

pains shooting through the cheek. There is of the cavity. They at first cause but little with cedema and redness. The patient may remain in this state for a length of time. The matter is discharged from the nose or not, according as the aperture may be open or plugged up. If the former, the patient feels relief from the discharge. In these cases there is generally some dead bone, but there is no difference in the symptoms, so far as my experience goes, whether dead bone be present or not, but the former is the more telious. You may apply leeches to the part, and put the patient on the usual antiphlogistic treatment; but this does not strike at the root of the disease. The first thing is to draw the diseased tooth, which will in some cases open to you a free communication with the antrum, when the patient experiences immediate relief. Sometimes you will find the discharge from the part very trifling, and in some cases there is none at all. If this should happen, the plate of bone hetween the alveolar process and the antrum is very thin, and may easily be broken down by a sharp-pointed instrument, and the two cavities laid open into one, when you may explore the antrum with a probe, and if you find dead bone there, you must wait until it has exfoliated. When you have made a free opening, keep the patient quiet, and keen a catheter or bougie in the opening, to prevent it from closing up. Through this you should inject the antrum with a syringe, very frequently. If the discharge come away through the nose, well and good. If it do not, you will know that the opening between the turbinated bones is closed, and the case may become troublesome. Suppose that the alveolary socket is filled up with dead bone. You must then make an opening. You would not make it through the jaw, because that is a bad place. Raise up the cheek, and then with a scalpel divide the membrane above the alveolar process of the molar teeth, and, having exposed the hone, make a circular opening in it, with a strong trocarshaped instrument. The instrument must be strong, or else it will break instead of the bone. I used a pair of strong sharppointed scissors in this case, the other day, because I had no other instrument at hand, when I introduced my little-finger into the antrum, and was enabled easily to hook out every piece of dead bone. There is a plug in this wound, to keep it open, and it is frequently syringed out.

" Some writers describe a polypus of the antrum, and have given descriptions as to how it is to be tied and extracted. This is perfectly hypothetical. I never met with a case of the kind, and I do not believe that

Malignant diseases, such as fungus hamn-todes and carcinoma, affect the antrum. wards, and its They grow from the inner lining membrane ever any "intell

slight effusion under the skin of the cheek, pain, and show no symptoms by which they can be recognised; but hy-and-by the tumour enlarges, pressing outwards on the cheek, upwards on the orbit, and downwards on the palate bones, extending itself, in fact, in every direction. The bony substances of the autrum and alveoli become destroyed, and the teeth drop out. The tumour increases, the walls of the antrum ulcerace, and the fungous growth protrudes. The cheek now becomes affected, and the eye may be pushed out of the orbit, causing blindness, or the roof of the month may be broken down, and the tumour press upon the tongue and nose. The growth of the part now becomes more rapid; there is a profuse discharge, and occasional bleeding from its surface; the patient becomes weak, gradually sinks, and dies. I do not know anything more distressing than the deathbed of a patient in this disease. There is a paper on this subject by Mr. TRAVERS in the Medico-Chirurgical Transactions. Such cases are, unfortunately, not rare. I suppose it must have been the occurrence of these cases which led to the idea of polypi of the antrum. Some have supposed that these may be removed by being turned out, or by the application of the actual cantery to them. DESSAULT I believe it is who had a case of this kind in which the patient remained free from the disease for three months; but you know that a malignant disease may return after twelve months. I tried the method of proceeding by turning out the tumour; the check bulged out, and the bone had been absorbed. With a scalpel I cut down upon it; the tumour was soft, and broke down, but I turned it out. There came on most frightful hemorrhage, and I plugged the antrum with blue lint, hoping that it might slough out. It did so partially, but the patient was not cured, and he died soon afterwards."

> The perambulation of the bospital is in regular periodical progress for the session. From the senior surgeon down to the deputy-assistant surgery man, and from the apothecary's sub-assistant down to Rodenick MACLEOD, all are at their posts, and there will continue—pro tem. At present, "one o'clock" finds them all on the move. Notice of every operation, autopsy, and inquest, is punctually posted up. Clinical lectures are given by Dr. SRYMOUR every Saturday, at four p.m.; by Dr. Wilson on pathology, every Monday at half past two p in.; by Mr WALKER OR Some surgical case, Thursday at a quarter before 4 p. Sir B. Brodie every Tues one p.m. on a surgical

ADVICE TO ROSPITAL PUPILS. On opening the "Clinical Course" on argery, Sir B. BRODIE addressed the folwing remarks to the junior pupils: "I propose to commence a course of linical lectures, and in each lecture I shall seak to you of some one case in the hosital, and in order to investigate some of the portant cases fully, I may perhaps deliver you three or four lectures upon one subect. This, however, I shall not do frenently. To explain to you these cases, owever, is only one object of a clinical cture. To know surgery well, it is necesury that you should know anatomy, chedistry, and materia medica, for these only ill give you a clear insight into its practice. in entering an hospital to study cases, it not merely necessary to study them to nable you to pass an examination at the Col-ge and Hall. You should observe and andy the cases for yourselves. That is the aly way to extend your information. When I examine a young man at the College, I esteem the knowledge which he has acquired by inquiring for himself, much higher than that which he has acquired by lectures. The explanation of hospital cases is of great service. The clinical observations which we make to you at the hed-side of the patients, can be heard but by few; I say you should therefore notice the cases for yourselves. I advise you to go round the hospital frequently. Go round with the surgeons, the house-surgeons, and even with the dressers and senior pupils, for those gentlemen have seen more of hospital practice than you, and can therefore give you much information on many subjects with which you are as yet unacquainted. There are always to be found cases of greater or less importance in the wards; but of these the latter should more particularly attract your attention. Many will pass by cases of cut fingers, or sores, or little fractures, as trivial affairs; but will you not continually meet with such cases in private practice? Make it your business, therefore, to understand them. Your first attention in the hospital should be directed to these, after which you may proceed to those of greater importance, which are only made up of minor effects. In a compound fracture, for instance, you have two minor points, a wound and a simple fracture, making up a greater one-a compound fracture. If you do not understand either of these minor ones, how are you to understand this? If in ping round the wards you are told of a ing sore, go and look at it yourselves,

this very much to be the case when first I began to lecture on surgery, and I soon discovered that there were a great many subjects to be treated of in my lectures, a knowledge of which I had yet to acquire. Be very minute in your observation of symptoms, as you may otherwise omit much that is valuable in the diagnosis of a case. There is only one way in which you can study cases sufficiently to remember them, and that is by taking notes of them for your own use, once or twice daily, or at certain periods, as may be necessary to impress the facts on your memory. I have been in the habit of keeping notes of many cases. When I commenced practice, I took down notes of every case. Now I take down fewer notes, and only those that are important. I have many volumes of these notes by me, and do you suppose that I find them useless? Do you think that I consider them as waste paper? By no means. On the contrary, I derive very great advantage from a reference to them. Take notes of cases then, and take them fully: there are no opportunities for study so useful as those which occur in an hospital. Years of private practice will not yield you the same advantages. Let me therefore urge upon you most strongly, not to neglect your hospital studies."

INGUINAL HERNIA, NOT STRANGULATED NOR REDUCED .- OPERATION .- DEATH.

WILLIAM HARRISON, admitted Sept. 14th, at 12 o'clock at noon. Sir Benjamin Brodie being absent, Mr. Cutler, the junior assistant surgeon, took charge of the case. On examination, there was found a punctured wound at the upper and inner part of the left thigh, on a line even with the base of the scrotum; and a large tumour of the left side, of the usual size, and occupying the usual situation, of inguinal hernia. The man stated that he had been afflicted with "the windy rupture" for fourteen years, but that up to the present time he had been always able to return it easily. Four days ago he met with a fall, when a metal spike ran into his thigh, and at the same time he received a blow from an iron rod over the part now occupied by the hernial tumour. These he stated to have caused the descent of the hernia, which has been down ever since. Mr. Cutler saw him immediately on his admission, and after examining the case, he requested the opinion of Mr. Keate (who was going round the hospital at the time) upon it. The surface of the skin covering the tumour was red; and, in the opinion of some gentlemen present, crepitated upon presbe any thing about it that you sure, indicating inflammation of the cellular ask the house-surgeon, or tissue beneath. We could not, however, the more experienced detect any symptom of the kind. The lower the more experienced detect any symptom of the kind. ou may depend part of the tumour was barder (Mr. Keate hers. I found upper, which was elastic, and was driven

down, upon the patient attempting to cough. the swelling, until the preceding four days, A probe introduced into the wound of the was untrue. Immediately after the sperathigh did not pass to any distance under the tion he was ordered, Calomel, five grains; skin. There were no very urgent symptoms present; there was no vomiting or hiccup, and Mr. Cutler, we were told, was rather doubtful as to the tumour being a hernia at all. Yet it seemed very evident to every one else in what the disease consisted. Mr. Keate remarked that there were no urgent symptoms present, but that eventually the operation must be performed. The man was then we believe put into the warm-bath, and the taxis was employed, but ineffectually. He had been twice bled before his admission.

At 3 p.m. Mr. Cutler performed the operation, assisted by Mr. Hawkins. The layers of fascia were successively divided upon a silver director, until the sac was opened, and a large knuckle of healthy intestine from the sigmoid flexure of the colon protruded. Mr. Cutler pushed his finger up to the external abdominal ring, and declared that the intestine was not strictured by it, but that it was quite free. Mr. Hawkins pushed his fingers down to the bottom of the sac, and passed them completely around the gut; but, after further manipulation, the intestine was not reduced, but left extruded from the abdomen, and the wound was united by sutures. After the man had left the operating theatre,* Mr. Cutler made some remarks on the case to the pupils present, the precise meaning of which we were unable to comprehend. Indeed we doubt whether any of the pupils who witnessed the opera-tion were able to understand why it was performed; nor was it until in a conversation between Mr. Cutler and Mr. Lanc, when the latter gentleman made some general remarks upon the case to those around him, that any one could account for the circumstance of a hernial sac being simply opened and sewed up again. Mr. Lane said that the contents of the hernial sac consisted of a portion of the sigmoid flexure of the colon uncovered by peritoneum; that it had become attached by longstanding inflammation to the base of the sac which rested on the contents of the scrotum, and, by its posterior surface, to the anterior and inner surface of the muscles at the superior part of the thigh. These old attachments not being able to be broken down, the intestine was prevented from being returned into the cavity of the abdomen. It therefore follows that the statement of the man, previous to the operation, that he had been always able to reduce

the man was lifted from the operating theatre to his bed in Drummond ward, but owing to some great neglect lie was, before the operation, neather into the theatre. The porter and surgery-men are new in their vocation, and like machinery on the first night of a pantomine, they work very "stiff,"

Compound Extract of Colocynth, ten grains, to be taken immediately.

On visiting him in the evening, six hours after the operation, he was found much casier. The tongue was moist, the pulse 80 and compressible, and he complained of no fixed pain. The bowels had not been lieved, and he was ordered Sulphate of Magnesia, two drachins; Infusion of Roses, one onnce and a half, every three hours: and

Soda Water for common drink.

Sept. 15. At half past twelve Mr. CUTLER saw him; the bowels had not been opened, and he had passed a restless night; the tongue was dry, and furred in patches; the pulse 85, and full. There were also general pain and tension over the whole abdomen (which had been fomented with warm flannels), and severe headache. He had been ordered three grains of calomel every four hours. On finding the patient in this state, Mr. CUTLER appeared auxious to "draw off the wind" from the belly, as a means of relieving him from the severe tympanitic tension under which he laboured. The man was ordered to lie on his right side, whilst Mr. CUTLER introduced an elastic tube into the rectum. This came in contact with the hardened feces, but did not bring away any "wind." A catheter was then introduced, and forced through a mass of feces, and a stilette was passed through the catheter, but no evacuation followed. Two stomach-pumps (Wiess's and Read's) were now procured, and an exophagus tube was introduced, and warm water was attempted to be injected per anum. The mechanical action of Mr. Weiss's instrument not being understood, it proved to be of no avail, and Mr. Read's was used instead; about a pint of water was injected, which the patient was unable to retain, and which served only to wet the draw-sheet on which he lay. Every method of drawing off the wind having failed, the man was left at rest, and the calomel ordered to be continued. The patient frequently complained of faintness, and vomited a little after the attempts at "drawing off" were discontinued. He was allowed beef-tea for diet. Mr. Cutler's reasons for acting as described, were founded upon his having followed a similar course in a "stone case, with great success; but doubts may fairly be entertained of the propriety of irritating the mucous membrane of the bowel near to the scat of a half-strangulated irreduced hernia which had undergone a tolerable degree of manipulation scarcely twenty-four before. The justness of this opinion somewhat confirmed by the bleeding the man in the ration which was

himself, to the l'espere. T opened; there is less tension and pain over flammation of the bowels, following a blow the abdomen since the bleeding, and pres-ure can be borne. The blood is highly cupped and buffed; pulse 80 and small; hiccough, and vomiting. The operation was anxious

amount of six onuces; the blood is highly buned and cupped; and has been again bled by the house-surgeon to twelve ounces this morning, the blood being as much cupped, but less buffed. The pulse is 100 and small, the tongue moist, and countenance less anxious, but the bowels have not yet been opened. He passed a restless night, and is was ordered Calomel, three grains; Compound Extract of Colocynth, ten grains; to be taken immediately. The prognosis of the case has now become unfavourable.

Vespere .- He is worse than at the morning visit; the bowels have not yet been relieved. Since the morning he has taken two doses of castor oil of one ounce each. Pulse quick and full, 100; abdomen tense and painful; countenance anxious; he is very restless. Soda water for drink.

17. On visiting the hospital this morning, his bed was vacant, and his body about to he removed to the dead-house. He sunk been administered to him, but without the least effect, and from the time of the operation until the hour of his death, the bowels were never relieved. The last medicine he took was port wine.

Autopsy twenty-four hours after death.

On opening the cavity of the abdomen, the general appearance presented by the coats of the intestines, was that of severe inflammation. On examining more par-ticularly that portion of the sigmoid flexure of the colon which was extended through the abdominal ring, it was found to be deeply injected with blood, the red vessels appearing very prominently through the gulated, and was returned very easily into the cavity of the abdomen by Mr. Lane, who was present. There was no band con-necting it to the bottom of the sac, and nothing but a thin adhesion between one of the appendices epiploicæ, and the posterior

ere not examined.

over a portion of extruded intestine. symptoms were followed by constipation, tongue moist; has not been sick since the performed to relieve these latter, which it morning; slight singultus; countenance failed to do. The constipation was attempted nxious. to be relieved by purgatives given only by 16. He was again bled last night to the mouth, the few injections that were administered being too mild (consisting principally of castor oil and sulphate of magnesia) to be of any service; whilst the severe inflammation was combated by four general venesections, of no great amount, the first of which was only performed twenty-eight hours after the patient had been in the hospital. Had the operation not been perstill restless; there is less tension and pain formed, and the venescction and purgation of the abdomen. His diet is beef tea. He been pushed to a greater extent, and had a generally bolder line of practice been adopted, the termination of the case would probably have been different.

Some doubts, we believe, were entertained as to the propriety of holding an inquest on the body. It was, however, eventually determined that one should be held,-when the assembled jury with an ignorant coroner at their head (on what evidence we know not), returned a verdict of "Died from Mortification." The morbid appearances afforded no ground whatever for the verdict, and a gen-tleman of competent anatomical and surgical acquirements, who also carefully exgradually, and died about twelve at noon amined the parts implicated in the hernial Purgative medicines, colocynth and calo-protrusion, informed us that he could dismel, calomel and opium, and croton oil, had cover nothing approaching in its pathological appearance to either sphacelus or mortification.

LOCK HOSPITAL.

CASES OF GONORRHOEAL DISCHARGE ACCOMPANIED WITH CONDYLOMA AND CONDYLOMATOUS ULCERATION.

Case 5 .- Margaret Gawlor, ætat. 18, admitted, Nov. 17, under the care of Mr. WALKER. She has been on the town three months, and has had a discharge from the vagina nearly the whole of that time. The condylomata, with which she has been affected, have been present for two months. The vaginal discharge was preceded by a scalding in passing her urine. At the commencement of her complaint she took six calomel pills, one every other night; this affected her mouth, which is somewhat sore part of the sac (which might casily have now. There is at present a profuse, thick, een broken down) prevented its complete yellow discharge from the vagina, which within the external ring. These exhibits some preternatural vascularity over pathological points in the case the vestibulum and orifice. There is an The cavities of the irregular gray sloughy ulceration over a patch of confluent condylomata, elevated much above the surrounding skin, and pre-senting more or less a warty character and by severe in-appearance, occupying the entire margin of

the left labium and apper part of the right | with a great tendency to sickness, and pain one, where however it is more circular and isolated; it also involves the right side of the perineum inferiorly and posteriorly to the labia. There is a thick yellow secretion from the posterior fauces; there is no in-creased vascularity about the throat and tonsils, which are but slightly enlarged; the right one, however, more so than the left. She complains of much general debility, and has a pleuritic pain in the left side, which prevents her lying on that side, and is sometimes increased on taking a deep inspiration. The tongue is clean but white; appetite impaired; pulse hard but compressible, 96. Bowels and catamenial secretions are regular. She never was preg-nant, and denies ever having had any previous venereal disease.

Nov. 7. The Acetate of Lead lotion was

applied to the ulcers.

8. This was changed for Oxymuriate of Mercury gr. 25 to 3j; Washed Sulphur 5j; Carbonate of Magnesia 3j: every morning carly. She continued this plan of treatment

until the

17th, when, on visiting her, we found her complaining of want of rest at night from pains in her limbs. She is very weak. The pulse small; tongue slightly furred. There is mercurial fetor of the breath, and the gums are tumefied; no appetite. Sulphur and Carbonate of Magnesia to be discontinued, and she was ordered, Comwound Decoction of Sarraparilla 3ij; Nitric Acid diluted may: three times daily.

22. To use the cinnabar fumigation every

night.

27. She is much better in her health. The vaginal discharge is less, and the condylomatous thickening of the left labium is diminishing, and the ulceration is healing, and covered with a dark dry scabious surface. She complains of great thirst, nausea, and syncope. To continue her medicines.

Dec. 6. She complains of great nervous trembling and syncope; pulse quick and fluttering. The condylomatous ulceration has still a warty character and appearance. Ammoniated Tincture of Valerian 5; Camphor Mixture 3iss : twice daily. The sarsaparilla to be discontinued. Solution of Chloride of Soda; Water; of each equal parts, to be applied to the ulcers. The cinnabar famigation to be continued.

11. The valerian draught was changed to-day for the Tincture of Muriale of Iron

May, three times daily.

13. She is certainly better since taking the steel. The affection of the labia is

15. Her bowels being somewhat disordered, the cinnabar fumigation and the steel medicine were omitted, and she was ordered to take a Rhubarb Draught with Tincture of Opium.

20. She is still very low and nervous,

on pressure over the epigastric region. She was therefore ordered to take the following powder at hed-time :- Mercury, with Chalk gr. ij; Compound Ipecacuanha Powder gr. v; Powdered Rhubarb gr. iv; Carbonate of Soda gr. x, and to have the abdomen treated with tepid fomentation.

22. To-day she was ordered Compound Tincture of Bark 5j; Aromatic Spiri of Ammonia gtt. x ; Decoction of Bark 5x : three times a day, and to have fish-diet and kill of port-wine, and half a pint of beef tea. Her strength gradually increased under this plan of treatment; the condylomatous nicerations and labial sores healed, and she left the hospital soon afterwards at the request of her friends.

Case 6 .- Julia Healey, ætat. 21, under Mr. WALKER. She has been on the town for two months, but her present complaints began four months since, with an intense itching of the pudendum, after which (two months since) a vaginal discharge came on. She has had severe scalding on passing her urine for four months, and ulcerations of the labia for two months. She has also had ulcerations without the labial commissure for two weeks. Three months since she took copaiba for one week, and has had promiscuous intercourse to within the last two mouths. Her present symptoms area profuse thick yellow discharge from the vagina, with much scalding in passing her urine, and general increased vascularity of the labial surfaces. There is condylomatous alceration of the nymphæ, with a superficial yellow ulcerated surface at the upper part of the margin of the left labium. There are several isolated condyloniatous ulcers in the external commissure between the right labium and thigh; the throat presents no particular abnormal appearance. The general health is very good. The catamenial discharge commenced at sixteen, and has been absent for the last four months. She has had one child, and has aborted once. She has had no previous venereal disease. There is much thickening of the præputiom chloridis. She was purged with Calomel and Senna, and the Acetate of Lead lotion was ordered to he applied to the parts.

June 23. To take a bath twice every week, and to continue the Acetate of Lead

lotion.

26. The discharge from the vagina has not diminished, but there is less scalding in passing her urine, and less general vasc larity and tenderness of the parties mouth is tender and the gums are pery taste. The Black to the ulcerations,

of the Acetates

iection. July 3. She all discharge for the last five days, and the | skin is of the tubercular character, and does and tumid, but there is little ptyalism. Medicines to be continued.

10. The condylomata have all gone. The gums are very tender, and at the back part of each side of the jaw they are ulcerated. she says that the vaginal discharge has rearned. The pills to be continued, and the stragth of the injection to be increased.

26. She is much better; the vaginal discharge is pale and small in quantity. The vestibulum is blue and vascular; ptyalism continues; the gams are florid, but not so much alcerated. The same plan of treatment was persevered in until the 7th of August, when she was discharged cured.

Case 7.-Ellen Trevelyan, actat. 20, admitted Nov. 20th, 1834, under the care of Mr. WALKER, with condylomatous labium, gonorrhora, and bubo. The history which she gives of her present complaints is very imperfect. She has been married ten months, and says that soon after her marriage she had scalding pain in voiding her urine, which has gone off and returned again several times since, but she has remarked no discharge until six weeks since. She has had a bubo and condylomatous affection for one month. She has had no connexion for three months, and has only taken a little opening medicine. She has at present a very abundant thick yellow discharge from the vogina, with much scalding pain in passing her urine. There is enlargement and thickening of the left labium with superficial condyloniatous ulceration along its inner margin, and there is one insulated condyloma at the inferior extremity of the right labium. The hubo is in the left groin, of the size of a walnut, and not at all painful; the inner surface of the throat is slightly vascular; the toosils are enlarged, more particularly the right, general health good; tongue furred; bowels confined; catamenia regular. She has never been pregnant.

22. She was ordered to take the White Mixture Biss twice daily, and to use the Saturnine Lotion.

28. The vaginal discharge is nearly gone, and the scalding is much diminished. The labial inflammation remains the same. A few spots of lepra have appeared on various parts of the body within the last few days. To take three grains of Calennel and three grains of Rhubarb at hed time, and to use the bath twice a week; a Blister to be aped over the bubo.

says that the discharge from the

scalding is almost gone. The gums are sore not partake of the characteristic appearance of legra, there being a circular deposition on the cutis, though under a slightly desquamating surface. Those spots which first appeared on the skin, are now so far advanced as to have left only a brown syphilitic stain on the skin. Some of the characteristic symptoms of the case bear now an apparent resemblance to a secondary eruption, succeeding to condylomata; although the ulceration at the inferior margin of the right labium does not partake of all the characters of condylomata. To continue her medicines.

Dcc. 2. She is much better to-day, the tubercular eruption is thicker on the skin. partaking of a mixed character of lepra and tubercle, some patches having the distinctive characters of each, whilst others assume the appearance of an intermediate variety which has been named small psoriasis. There is one leprous scab with some surrounding redness under the right scapula. The case exhibits specimens of the three varieties of eruption, of simple stain on the skin, lepra, psoriasis, &c. On closely questioning her, we learnt that about three weeks since, she remembers having a sore on the lower extremity, which bled.

6. The eruption is increasing, there are light yellow scabs over the scalp around the roots of the hairs. There are several wellmarked spots of lepra on the skin, but fewer of psoriasis. Some of the glands of the neck are swelled; she is very weak and low, with some disposition to syncope. Many of the symptoms being now severely aggravated, and the decided syphilitic character of the disease not to be doubted. Mr. WALKER determined to put her on a mercurial course. She was ordered to apply the Black Wash to the ulcers, and to rub in half a drachm of the Mercurial Ointment every night.

13. She is very much improved in health; the syncope and trembling subsided soon after she commenced taking the mercury; there is now incipient ptyalism, with a coppery taste in the month. The cuticular cruption has much subsided, and some of it is desquarenting. The excoriation and ulceration of the labium have healed, and the thickened appearance of the parts has gone down. Blue Pill five grains; Extract of Henbane two grains: to be taken in a pill twice daily.

20. Her improvement has been very rapid. The cruption over many parts of the body has quite gone, and in others there is only a scabby stain left; there is but little stopped, but that some little thickening of the labia left; she complains he complains of great of some pain over the epigastric region soon at does not advert after taking the pills; there is free salivation thesa. The present; there is slight puffiness over the uption on the to be slightly ulcerated. She was ordered

convulsive movements of the limbs, and in distance in a perfectly insensible state; and since the occurrence of a very bad fit which pened twenty years ago, he has dragged

t leg after him, at the same time

that he has been lately in very difficult circumstances, from poverty, which had acted much on his mind, though on Thursday the 6th of August, three days before admission to the hospital, he contrived to drink a bottle of wine. On the next day he did not appear to his friends to be perfectly rational. On Saturday he fell down in a fit, and from that time he has had delirium. The irrationality increased from the time he bad the fit. He was admitted on a Sunday, (I did not so, him then,) and his skin was hot. and his forchead pale, and perspiration stood upon it; he was continually delirious, talking incoherently, and repeatedly uttering the same words .gain and again. His face I HAVE selected a case, gentlemen, for my the same words gain and again. His face first discourse with you, which I consider is stated to have een finshed, and the pupils ontracted, contracting · application of light. h Wight, his countets natural enc was accompanied his own jokes. He says that of the brain and nervous system. I shall he feels no pain any where but in his feet. The head is free from pain. Now the reason of his complaining of his feet you will see in a moment. The medical man who had visited him before he came into the Henry Grey, a man above the ordinary hospital, had very properly directed his stature and rather of a robust habit, aged feet to be put into warm water; and into 39, was admitted on the 9th of August, with warm water they had indeed been inserted, a statement by his mother that for the last for they had actually been boiled, and now twenty years he has been subject to fits. presented complete masses of blisters. In those fits he usually falls down suddenly, Every one of his toes had some portion of becomes perfectly insensible, and experiences the enticle separated from it, and he seemed fully aware of their condition. His tongue that state he remains for a few minutes, or he puts out after a little solicitation; it is perhaps even for a quarter of an hour. She very slightly coated, and rather dry; there states that he neither hites his tongue, nor is no tenderness of the abdomen, but it is froths at the mouth, but discharges large rather tumid at the lower portion, and he quantities of flatus from the stouach when discharges a good deal of flatus per anum. the fit is over. It is added, that occasion- His bowels were operated on by medicine ally, instead of falling down, he walks some before his admission, and he was bled twice, and had leeches applied to his head. His pulse on admission was 120, full, and admitting pressure.

then to have been more severe. It appears

Well now, when Mr. STONE saw him in weakness in both legs. this condition on his admission into the hosda half ago, after having pital, considering, and very properly considering for three sucdering, the state of his pulse, he ordered similar to the sixteen ounces of blood to be taken from the but stated it arm, directed a cold lotion to be applied to given to him every six hours. The report next day states that he passed a very restless night, that he was delirious and raving at intervals; his head and skin were very hot, but yet they were copiously bedewed with perspiration. He complains of nothing but his feet, and asks every body who goes near him to loosen the straps. You ought to be informed that he was brought to the hospital in a strait-jacket, and remained in one ever since, and had been fastened to the bed by leather belts. The tongue is now pretty clean; the pulse 120, and rather jerking. He continues in much the same state, raving, and talking indecently and lewdly all the day. Now it was at this time that, happening to be at the hospital, though it was not my day, I was requested to see him. I do not know that it would have been absolutely necessary, even if there had been proper people to sit by his bedside to have confined him as he was confined: indeed, it is quite impossible here to have people employed for that purpose in the case of every such patient, for a dozen similar patients may be in the hospital at the same moment; it therefore became necessary to confine him in another manner,-in the manner I have stated. Well, on carefully examining the case, and finding there was heat of the head, -finding that the pulse bore a considerable degree of pressure, and that the tongue, though not much coated, was still a little drier than one would have expected in the disease-in the true disease, (of which I shall speak by and hy,) -finding these things, and taking the history of the case into account,-its occurrence after intoxication or excessive drinking, -excessive, when compared with the abstinence which he had previously been obliged to undergo, taking also into consideration the nature of his delirium, which, although he talked, and hallooed, and raved, was, notwithstanding, not difficult to subdue; and finding, in addition, some tremor in the hand, and some tremulousness in the tongue, I pronounced the case to be, and now present it to your notice as, a case of delirium tremens,—that description of delirium tremens which has been considered by some authors as the second species of delirium tremens, namely, delirium tremens with high vascular action in the membranes of the brain, or in a portion of the brain itself, or in both; or, in other words, irritation of the brain,-with inflammatory or congestive action going on in that organ.

Perfectly agreeing, therefore, with the propriety of Mr. Stonk's treatment as regarded bleeding the patient, but knowing that further bleeding should be had recourse to only most cautiously. I did not hesitate, under those circumstance, to repeat the bleeding moderately and beauty, by ordering eight ounces to be taken with the cupping-

the head, and had three grains of calomel given to him every six hours. The report next day states that he passed a very restaless night, that he was delirious and raving at intervals; his head and skin were very hot, but yet they were copiously bedewed

Now the prognosis in this case was exreedingly doubtful. You are to remember that the man had for twenty years previonsly been the subject of epileptic attack; that he had also been the subject of a previous attack of a similar kind, and therefore it was not unlikely that he might be suffering under some slow change of structure in the brain itself, or its membranes, consequently the prognosis was exceedingly doubtful. Still I was satisfied that the correct mode of treating the case was to diminish irritation by means of large doses of morphia or opium, and at the same time to relieve congestion or inflammatory action by moderate depletion.

The report of the next day, August 11, states that during the first few hours of the night he had only a few seconds of sleep, and that he then awoke, and raved most furiously; but that towards morning he had three hours and a half of sleep, and that when he awoke he appeared to he better. He is now much quieter; he is more rational, and appears to know some of the events of the preceding day; he still wan-ders a little, but the furious delirium is quite gone. He became tranquil after taking the two first doses of morphia. His skin is still hot, his face not so much flushed, and the pupils are rather contracted. He says that he has a little pain in the head. The pulse is 116, full, and soft. Tongue now clean and moist; bowels open. He was directed to be again cupped on the occiput, to the extent of eight ounces.

The report of the next day, the 12th, states that he passed a pretty good night, slept very well, but wandered at intervals. He is now sensible, and answers quite correctly, but occasionally talks incoherently. His skin is quite cool, and the countenance not flushed; the pupils are still contracted. He says he has no pain in the head, but he feels drowsy and hanguid. His hands are tremulous, and he is a little more exhausted. Tongne clean, bowels open, and now the pulse has come down to eighty, and is somewhat full. He was directed to be released from confluencent, and to take the calomel and muriate of morphia every six

instead of every four hours.

The report of the 13th states that he did not pass quite so good a night. There we more heat of skin, and more general ement. He wandered a little at the way to the head; no the head; no to the head; no to

haves large poultice applied to his feet and epileptic character, which continued for a

The report of the next day states that he passed a very good night, but continued much in the same state. Pulse 82, not so full, but somewhat jerking; still there appeared to be a little more tremour, and therefore I ordered him to have a pint of bof-tea a day. Wishing to diminish the quantity of the muriate of morphia, I directed half a grain to be given him every eight hours. He passed a very bad night after the quantity of morphia had been reluced, and was very restless, tossing about in bed, talking loudly and incoherently, swearing violently, and moving about to such an extent as to compel them again to put him into confinement. His skin became hot, his face was slightly flushed, and the pupils were contracted. Mr. STONE was called in the morning to bim, and very properly gave him a grain of the muriate of morphia. After he had taken this he had some sleep, and it is stated that upon awaking he appeared to be pretty quiet. Tongue moist and clean; bowels opened lour times during the night, and once this morning; pulse 94, and rather full. He was again directed to take the half of a hours.

On the 16th the report states that he had passed a good night, and proceeds thus :-Wanders a little occasionally; face not flushed, but pupils still remain contracted; tongue moist and clean; still tremulous; bowels considerably relaxed; pulse 90; feet very sore, but not so painful as they have been. The mercury was now running off by the bowels; it had produced irritation of the mucous membrane, and it was found necessary to give him an ounce and a half of the compound chalk mixture after each stool, and to continue the morphia.

The report of the 17th states, that he passed a tolerable night, remaining very quiet, and much the same as yesterday. Pulse 94, becoming rather more feeble. It was then considered necessary, in addition to the muriate of morphia, to allow him, in small quantities at a time, a pint of porter in the course of the day.

The report of the 18th says, he did not sleep much during the night, but was quite collected. He wandered a little this morn-Countenance very natural, pupils till rather contracted. He complains of his feet being very sore. Tongue clean; owels rather quieter than they were; pulse ad still rather feeble. He was directed linseed-meal poultice applied to with the Liq. Plumb. Acet. was becoming rather o take a grain ry four hours.

He was directed to omit the calomel, and to seven o'clock, he was seized with a fit of an long time, during which his features became distorted. I presume that the pulse at that time could not have been very much excited, for either Mr. WHITFIELD OF Mr. STONE found it right to give a drachm of the Spiritus Ætheris Sulphurici Compositus, and a drachm of the Aromatic Spirit of Ammonia, in a camphor mixture, which he took; after which, it is stated, he slept soundly, having no return of the fit, and remaining much in the same state as before the fit occurred.

> Then the report of the 20th of August states that he passed a very good night, and continued tranquil and rational both yesterday and on this day. The skin quite cool; no pain in his head; pupils contracted tongue clean, rather dry; his pulse 84, and feeble. Feet not better; there is a large sore on the heel, which is sloughing. Bowels much quieter; the dose of sulphate of quinine was directed to be increased from one to two grains; and as he did not like the beer, it was directed to be omitted, and he was allowed four ounces of wine daily instead.

The report of the 21st states that he passed a pretty good night, but that during grain of the muriate of morphia every four it his bowels were opened four times, and twice this morning. He is quite sensible; pulse 86, and somewhat full; his tongue a little dry in consequence of the irritation in his bowels, and it was found necessary to change the chalk mixture for some of the compound infusion of catechu.

He was directed to have a slice of meat on this day.

The next report states that he passed a good night; pupils contracted; bowels quiet; tongue moist. As the bowels became quiet, the tongue became moist; bowels open only once; pulse 90. He was directed to continue the sulphate of quinine every four hours, but to take half a grain of the muriate of morphia every six hours.

The report of the 23rd is to the effect that he continues much the same.

The report of the 24th states that he remains quite rational, but that the bowels are rather relaxed; tongue clean. It was now found necessary to add a drachm of the tiucture of kino to each dose of the infusion he had been taking.

On the 25th the report states, that the bowels were more relaxed to-day. medicine does not check the purging. complains of some pain in the abdomen. There was a degree of tenderness there, which was distinctly traceable along the course of the colon. The stools contained a good deal of mucus, but still a considerable secretion of bile. His tongue was clean at the edges, but white and dry in the middle. Complains of thirst. It was quite clear now sing, at about that there was something more than simple

irritation going on in the bowels, which I him was to order that he should have twelve thought it probable that the quinine helped to continue. I therefore directed that medicine to be omitted, and eighteen leeches to be applied along the track of the colon, to be followed by the application of a blister in the evening, still at the same time continuing the astringent medicines; and if the starch, with twenty-five minims of the tincture of opium, thrown into the rectum every morning.

The report of next day states that he felt relieved, and that he had now no pain, except from the soreness of the blister. The howels had only been opened once since the last remedies were resorted to. His tongue a little dry in the middle, bis thirst less, and

he remains perfectly rational.

The report of the 27th says, that his bowels had not yet been opened on that day; he sleeps very well; tongue moist, but a little coated; his face a little flushed; the skin rather hot and dry; feels thirsty; pulse 96. He was directed to take half an ounce of castor oil. For some time the muriate of morphia, in consequence of his remaining so perfectly rational, had been gradually omitted, so that by this time he had ceased to take it. It appears by the report, that the castor oil operated violently; seven stools followed its exhibition. The astringent mixture was again ordered, and it checked the purging. His howels are a little relaxed to-day, and he complains of some tenesmus on going to stool. Tongue moist; skin rather hot; not so thirsty, and the flush has left the check; pulse 84. As he objected to his wine, saying that he did not like the taste of it, an ounce of brandy was given to him every twenty-four hours in gruel or arrow-root.

The report of the 29th states that he feels better. The bowels had been opened once; he has little pain except from the blister; his countenance is clearer, and natural; pupil natural; tongue a little coated;

pulse 72, not very feeble.

The report of the 31st states that he has one on very well since the last report His bowels had not been opened for two days; tongue a little foul at the root. He was directed to take two drachms of caster oil immediately; the dose to be repeated if necessary. The first dose did not operate, but the dose in the morning produced three stools; he complains of nothing but his heels. Tongue clean and moist; pulse 74, and pretty good. The sores upon his heels are healthy and granulating.

Well, now, it was not necessary to do any thing more for this man. He went on gradually improving from the 1st of September until the 1st of October. I quitted London myself at this time, and I find that all that was further necessary to be done for be divided int

minims of dilute sulphuric acid, with a drachm of gum mucilage of acacia, out of infusion of cascarilla, three times a day, in consequence of considerable perspiration. This plan was directed on the 15th of September, and was continued, with merely an occasional exhibition of a slight aperient. purging was not relieved by those remedies, He lost all tremour, he had no pain in his I directed that he should have a glyster of head, he was perfectly rational, and he we at out of the hospital quite well on the 1st of October.

> Now I stated to you that I considered this to he a case of delirium tremens, as I chose to christen it, attended with high or excited vascular action, by which I mean to imply delirium tremens consisting of irritation of the brain; that irritation in this particular case being accompanied by some degree of inflammatory action or congestion,-I believe of inflammatory action either of the membranes of the brain or of the brain itself. But I do not think that our time will be mispent if I just say a few words about delirium tremens itself; leading afterwards to that form of it under which I consider this man to have laboured.

In former days this disease of the brain and nervous system was most commonly confounded with phrenitis, until Dr. Surrox of Greenwich published a valuable treatise on the subject, and pointed out how essentially it differed from inflammation of the brain. and showed that it was, in fact, a distinct and peculiar affection of the brain and nervous system, - distinct from inflammation, and therefore requiring peculiar and distinct treatment. Other medical men have since written on the subject. The term, perhaps, is one which we cannot regard as exactly correct, inasmuch as delirium tremens is a term which certainly implies a something that does not take place. The delirium itself cannot tremble. Other persons have variously christened it. Pearson and Armstrong called it "brain fever." Dr. BLAKE called it the "brain fever of drunkards." Dr. Corland has called it much more properly "delirium cum tremore." There is delirium, and there is trembling; therefore the latter perhaps is the better term. Still, if we distinctly derstand by the term "delirium tre of what the discase really con no objection to that de

The disease

be said to be delirium with tremour, most gets out of bed, pernaps, and wants about probably, as Dr. Gregory has stated, aristite room during the whole night. Pering from exhaustion of the nervous power, haps, before this, you begin to find that membranes of the hain, or in the substance sometimes of an offensive odour. During of the brain, or in both; in other words, the whole of this time, however, you will accompanied by more or less of inflamma- in his head. Often, very often, these pation or congestion.

Now the symptoms of the first species of the true delirium tremens generally manifest themselves in this way :- A patient for a time is a little different in manner and appearance to what is generally observed in him. His friends notice a little peevishness, a little fretfulness, and, at the same time, a little abstraction in his manner. He finds fault with his associates. From being a good-tempered or a good-natured man, he becomes a hasty one, and complains unnecessarily. He does not appear to be well, but at the same time, if asked whether any thing is the matter with him, he will perhaps snappishly answer, "No, I am quite well." This goes on, probably, for two or three days, perhaps for a week, in some instances for a fortnight, a change only manifesting itself in this way. His appetite fails at the same time; his nights are restless; he tosses about in his bed, and when he gets up in the morning, having had little sleep, in some instances scarcely any, he does not feel refreshed. As the disease advances, his fretfulness yields, perhaps, to some particular delusion, (or, to use what is probably a better term,) to some illusion. That illusion most commonly relates to his own affairs, or perhaps to the affairs of some particular friend; the illusion being always of a despouding character. He imagines, though perhaps rolling in riches,-or at all events, possessing every comfort, his business going on well as usual,—he fancies that every thing is running to sixes and sevens, and that he is going to the dogs as fast as he can, and that it will be as much as he can do to avoid getting into jail; or he thinks there is some conspiracy against him, or against his life, - some attempt to assassinate him. All his illusions are of a desponding, or even of a horrible character. At times—with less illusion, perhaps, as regards himself-he is busied in setting to ights the affairs of his friends. If spoken this time, he will answer with perfect

He will tell with perfect cor-

is in health, but directly

abstracted, and re-

and consisting wholly in irritation of the his hand trembles very much, that his brain and nervous system, constituting the tongue is exceedingly tremulous also; and true "delirium tremens" of Dr. Sutton. now if you examine his skin, you discover The second species of delirium tremens is that it is bedewed with a cold, clammy, accompanied with more or less tremour, but sticky perspiration; and it is stated, though at the same time it is attended by a highly I cannot say myself that I have ever obchited state of vascular action in the served the fact, that the perspiration is irritation of the brain and nervous system, find that he does not complain of much pain tients do not complain of any pain in the head. Now, it is right to put you upon your guard that there will be sometimes pain of the head, and most commonly there will be a profuse cold, clammy, sticky perspiration, over the whole surface of the body, the extremities feeling cold too; there may be no heat of the head, but the head will be bathed with perspiration, though sometimes that perspiration-I will not say is wholly absent, but is so slight as easily to avoid detection, unless you assiduously look for it as one of the symptoms to confirm you in your diagnosis. Now, I stated that the tongue is, commonly, tremulous, in addition to which, if there be simple irritation of the brain and nervous system, unconnected with anything like inflammation, you will not find it dry, you will not find it rough; you will find it a little coated, it is true, but it will be coated with a white creamy moist muens.

Now, in acute inflammation of the brain, you have not in the carly stage a tremulous tongue, but a dry rough tongue; and as the disease advances, in the latter stage you have a tremulous tongue; but it is not tremulous from the beginning. The face, which affords other indications in true delirium tremens, is pale; the eyes are rarely suffused, but they are somewhat dull. 1 say rarely, because I have in one or two instances seen the eyes slightly suffused, but not evincing a tithe of that suffusion which you will find in active inflammation of the brain. At the same time there is no intolerance of light or noise. The pulse, if the disease comes on slowly and gradually, is, at first, perhaps, soft and slow; as the disease advances, it becomes quick, soft, and feeble; and as it still further advances, the pulse becomes rapid, and if the disease is about to terminate fatally, either unaided or not yielding to aid, then perhaps it becomes fluttering, and that sort of pulse is felt, which I do not know how to describe better, than by calling it a "fluid pulse, which seems like the flow of a continuous stream of water under the finger.

I stated to you that there was generally stee of illusion, considerable tremour of the hands, and at the same time tremour of the whole body. This, however, varies in intensity, from being so dition of the brain and nervous system un- resources of nature in curing fractures and der that state of irritation.

I have something more to say upon this subject. I have to speak of the treatment, and a little to say upon the diagnosis and the distinct points of treatment of the two species, and therefore I will postpone these divisions of the topic, as the hour has elapsed, until next Monday.

ON THE

TREATMENT OF FRACTURES

WITHOUT THE AID OF SPLINTS.

By W. C. RADLEY, Esq., M.R.C.S. L., Newton Abbot, Deconshire.

THE illustrious Sydenham, in his old age, said. "Don Quivote is a good book: I read i him still." I think and act with Sydenham in this respect, and am induced to select quotation as a preface to the observations I am about to make on an important branch of surgical art :- " At all times, in all places, and by all the learned, simple means of cure are more esteemed than those that are compound." I have watched the simplicity of nature in all things natural, and endeavour to imitate her in all things artificial,-especially in the practice of surgery; and thus it is that in the treatment of the accidents of which I am about to speak, I have been enabled to throw off the useless lumber of art in the shape of splints, and to effect cures with less pain to the patient, in shorter periods, and in a far more creditable style of surgery, than is generally possible under those old encumbrances.

Nearly twenty years have clapsed since my first attempt was made to cure a fracture without force and coercion, and success has invariably followed every subsequent effort; and I now assert, that every species of fracture which is curable with splints, may be much better cured without them. Moreover, I affirm, that splints are not only useless, but positively injurious; productive of great pain and inconvenience to the patient, and in no case can give aid to the cure. On the contrary, I consider that they retard that desirable termination of our services. Fully aware am I, that assertions which condemn the practice and views of ages, should be advanced with caution; and influenced by the considerations which innovations always create, I have hitherto been deterred from presenting my thoughts with irritation, and and practice in writing on these matters undue accumulation to the attention of the profession. As to limb, which public opinion (founded on ignorance of the bandage; for

other injuries), among those persons who have been my patients, as well as a host of friends whose feelings of interest have been awakened on the subject, I used continually to find them to be active opposers of a mild system of cure. By far the greater number of persons think that a broken bone cannot be "set" without the use of force; nor afterwards retained in a proper positan but by strong compression, or what I have termed coercion. In all such cases I had ever found my patients more disposed, through fear of the results, to suffer the irksome tyranny of the splint, than to have themselves allowed the use of a soft pillow.

But not so now. Opposition to the plan has ceased among them; and where my assistance is required, bystanders, though yet half incredulous, let me proceed without remonstrance, while I assure them my aim is to make the patient easy and so to keep him, referring to numerous cases in proof of its efficacy. I mention this popular prejudice in favour of long-established usage, because many preposterous modes of cure in medicine and surgery will readily occur to from the pages of Cervantes the following the mind of every practitioner, wherein absurdities no longer have a place in practice; and of which the wonder is that they should have ever been adopted at all. Let any candid surgeon read a modern catalogue of surgical instruments, and reflect on the announcement it makes. He will there find offered to him a choice of "Mr. Amesbury's apparatus" (excellent of its kind) "with splints complete." There are splints bearing the names of the venerated Pott, of Cline, of Sharpe, and of Martin, "whalebone splints," "improved fracture cradles, used at Guy's and St. Thomas's," "japanned" and even "iron splints," and, last but not least, "long splints, to reach from the foot to the arm-pit,"-to keep one set of muscles in protracted and painful extension, while their antagonists wait in an agony for their turn to move. Are these the resources of surgery in the year 1835? They constitute the abuse of surgical mechanism, which ought for ever to have given place to chemical science? When a fracture is properly reduced, the cure proceeds to its accomplishment, not on mechanical, but vital principles, assisted by rest and a genial atmosphere. I assert therefore, that mechanical aids should ever be passive and not active, where there is no displacement for the hand to reduce. All force or external pressure that produces pain is mischievous, and should be avoided.

In such a state of things, one indicate alone should influence our minda which the patient feels.

neither the splints nor the bandage can be the breast and shoulders, close to air, and of use? Even if the limb be not in a malposition, yet irritation, passing into active without surgical aid it unites, and a cure is inflammation, tends to delay the result of perfected. our efforts; and to secure ease to the patient, we should sedulously obviate those errors, method is pursued. Like the clavicle, it is and prevent the evil of malposition, by fre- merely bound round with the common intequent examinations of the limb.

A man had the right lower maxillary the mental anguish; secondly, the pain pro- bone fractured; the broken side was firmly duced by awkward motion, clumsy hand- supported in situ naturale, by a pad of line ling, and the supererogatory offices of "set-ling," by compression and restraint, and press most on the dependent portion. The thirdly, the permanent evil consequences blow was a heavy one; but after he had lain that too frequently follow, - evils which are ten days in bed, he got up, moved about, much more commonly produced by mal- could eat sufficient, talk enough, and slept treatment than by the simple effects of the soundly, mutil the sixteenth day from the accident alone.

muscles, by the compression, had lost the appropriate uses. power of motion,* in consequence of which the muscular energy of the limb continued for a long period impaired, requiring much matter, and unite, with common warmth and patience and assidnous discipline to restore quiet, without splinting. it to health, though the patient was a hearty

and vigorous youth.

Another fine athletic fellow whom I saw, by falling across a low grassy bank, fractured his femor very near the centre. Six where the bones are imbedded in thick musmonths afterwards I saw him, weak, pale, enlar parts possessing strong vascular acand emaciated, with a pair of long splints tion! I write at a disadvantage, because bound upon his thigh with a degree of force splinting has long been the custom, and the that brought to my mind the sailor's mode custom it will continue to be, until a fair of fishing a broken mast, and all this infliction for the vain and ideal purpose of keeping the bone "right," though without any such force, the limb would have repltained its use in one fourth of the time which was occupied in the cure. Each of these was a case of simple fracture.

Let me seriously ask, Do surgeons ever apply splints to a broken rib. The practice is not possible; but does not the bone unite and heal without it, and simply with a little plaster spread on lamb-skin, although the bone is not deeply scated in and clothed with muscle like the thigh, the leg, or the arm, but merely covered by integuments; and, moreover, is repeatedly in motion, from the convulsive shock of the cough which the accident excites. There are exceptions to the rule, but they do not affect the argument.

In fractures of the clavicle, I have never gd that the inventive power of surgidesigned a splint. Yet look this osseous appendage to

The suffering produced by fracture and Quixotic professor) would splint up a broken accident, when the frolics of a country revel Not long since, a young peasant in a tempted him from home, when he got half neighbouring village fractured the femur drunk, and entered with much volubility rather below the centre of the shaft into the particulars of his accident, the re-Twelve weeks afterwards I accidentally saw sult of which was, a stiffness of the parts on him, with his thigh tightly splinted up, and the following day; but common care soon unable to set his foot on the ground; for the enabled him again to put the jaw to all its

Long fissures and fractures of the bones of the cranium become filled up with ossific

If in these comparatively unfavourable situations the union of bones is perfected without the aid of splints, how much more certainly and rapidly will union take place, trial shall have been given to some such plan as I am about to advocate, in which simple precepts and a greater reliance on the resources of nature, tend to make the application of the splint a barbarous and obsolete fashion.* I have waded through some quartos for the purpose of culling facts from the practice of others, to support my views in the cure of fracture, but with little success, and that of the negative kind, the statements being made without the design of militating against the general doctrine. Sir Astley Cooper's elaborate work on dislocations and fractures of the joints, is authority enough on the general employment of the "splint and fracture box" at the great London hospitals; and Dr. Bush, of Totness, a gentleman of great professional talents, on lately returning from the

^{*,} A favourite dog belonging to one of Sir Walter Carew's packs of fox-bounds ventured too near the heels of a vicious horse, which kicked back and broke heels of a vicious horse, which kicked back and broke the dog's leg. He was cured without splitting, for after the lapse of three days he industriously grawed off every thing that was put upon the limb. He was continued until well, getting fat the while; and he has aince lunted as before the fracture. An African pigeon, which had its thigh broken, was cared with-owt a splint or deformity.

(the subject was a gentleman aged 74, a severe contusion has been unfortunately neighbour of Sir Astley's), a pasteboard splint and an evaporating lotion were used. in obviating the accession of heat and its This dressing was not disturbed until the twenty-fifth day after the accident." "The wound was some time in healing, being prevented by the pressure of the splint." This suffering was endured for a month, wanting three days only, by an old man with all the fidgety uneasiness of seventy-four years upon him. I fear this case did not end to the patient's comfort at those gastronomic seasons, when he wanted to carry a cup or a fork to his mouth. This recluse system of casing up limbs from the eye for a month, much as I admire Sir Astley Cooper as an operative surgeon, takes I think from his credit for penetration into the remedial processes of the body.*

At page 259 of the treatise, we are recommended to apply a many-tailed bandage; and at page 370 " a light bandage in cases of fracture, wetted with spirits of wine and water." This application to most recent cases of fracture is decidedly bad. Let spirit be diluted with water ever so much, still the compound will be a stimulant. The first indication of surgery in these cases is to prevent heat which stimulation excites, and the second is to allay and subdue heat when it has been excited. The injury of the fracture itself, when effected with as little violence as may be, the jagging extremities of the bone acting on the soft parts, will always be a powerful exciting cause of heat,

* A very ugly "care" of fracture at the appear portion of the tibia, four or live inches from the inferior point of the patella, occurred to a respectable farmer in the prime of life, a few miles from hence, by a cart-wheel passing over it. The surgeon splinted and bandaged as usual. The leg was schlom exammed, the real position of the fractured ends of the bones was for the greater part of the time concealed; and when the limb was examined, the soreness was so great from the pressure, and the tumefaction so long remained, that little good was done by gemle extensions from time to time, or any other kind of mo tion. Twelvemonths afterwards the good man showed me the limb. I concealed my surprise, for the projection of the superior edge of the fractured portion of the tibia, over the inferior portion of the bone, was full three quarters of an inch. Of course that projection was anteriorly and superiorly. Here was a " cure!" Why it was five years before the man could bear to step firmly with the leg, the weight of his body overhauging the line of bearing on the foot! He was told by his surgeon that all this displacement and weakness was a part of the consequences naturally attendant on so bad a species of fracture. Of course I did not disturb this opinion. I only recommended him to make "the best of a bail matter," encouraging him with the hope that time would mend it a little, under the long-continued anspices of a plastered, circular, dressed skin, and a bandage which he wore for a year, having them from time to time renewed.

of compound fracture of the elbow-joint irritation, and pain. But in cases where superadded, I have found ample employment effects in the use of a very weak lotion of water and superacetate of lead, or some decided sedative; or in tepid bathing, with exposure to the atmosphere to promote evaporation. This object cannot be attended to under the customary mous of proceeding.

(To be concluded.)

PECULIAR RELAXATIONS OF THE UTERUS.

By F. MONTGOMERY, M.D., Physician-Acconcheur to Sir Patrick Dun's Hospital.*

WHEN the uterus has expelled the product of conception at any period of its growth, active contraction should immediately commence, and its volume be speedily reduced to its original dimensions. But matters do not always proceed thus favourably, the uterus being liable to fall into a state of atony and relaxation. One condition of this accident, of whose existence I have fully satisfied myself in many instances, has not, as far as I am aware, been noticed by any writer, the peculiarity of it being, that it continues in a chronic form, occurring most frequently after early abortions. which, however, are not necessarily connected with any loss of blood during the miscarriage; but when the patient is beginning to take exercise, she is unexpectedly seized with considerable hemorrhagic and leucorrhical discharges, inducing great debility and alarming apprehensions, with, most frequently, no pain, but a sense of internal fulness, which appears to her to interfere with her passing water; she has a dull aching feel in the small of the back, and is constantly annoyed by a sensation of relaxation in the whole contents of the pelvis. On examination the vagina is found unusually relaxed, and the os uteri gaping, with its lips tumid, thickened, and projecting, soft, and flabby; the cervix is dilated, its natural tapering form is gone, and the body of the uterus itself is felt to be enlarged and doughy when pressed by the finger, the organ appearing quite insensible. This condition may persist sometimes for months, with various degrees of constitutional disturbance, the discharges being someth so profuse as to endanger life, but slight, or only occasional tracting attention ance, than by the

symptoms.

ccur under these circumstances; but if the | and constant cloths wer with vinegar and estored, abortion will almost inevitably appen. The details of a few cases will lucidate these points.

Case 1.—In July, 1830, I was called to ee a lady who had just miscarried in the econd month of gestation, with profuse henorrhage. She had miscarried twice alead@within the preceding six months. On his third occasion she seemed to recover vell, and left her bed in a week. A tonic ystem of treatment now employed by me ailed, and she did not cease to have vagiial discharges. I then examined the os steri, and found it just in the state it had cen in a month before, gaping open, soft, claxed, and flabby. I recommended her to to the sea-shore, leaving her husband schind. This was done; she took small mantities of oninine and gentian, with aronatic sulphuric acid, and bathed every day intil November, when she returned home completely re-established in health, and mmediately afterwards conceived, and on the 6th of the following August* gave birth o a fine healthy child, which she marsed with niccess. She has had two children since.

Case 2.-On the 30th of January, 1832, Mrs. V. aborted, without cither pain or aemorrhage, on making water, in the third nonth. She had been some time before greatly startled by a hatching hen, and she now gravely asked me if I did not think what she had been delivered of was very like a chicken. At the end of a week she was able to go about as usual. Two months after the miscarriage she sent for me; from the time of the abortion she had never been entirely free from vaginal discharge, and pains, resembling slight after-pains, with resical irritation and dysoria. I found the aterus almost exactly in the state I had felt it two months before. Tonics, free ablution of the lower part of the trunk with cold salt water, and opening sea-bathing as soon as the weather permitted, perfectly re-established her health in about six weeks, during which time she lived absque marito. She conceived again, and was delivered in February 1835.

Case 3. - In the middle of April 1834, a sister to the patient Case I, and mother of six or seven children, miscarried carly in the third month, with very little pain or hemorrhage. At the end of a fortnight she went to church, felt greatly fatigued, was seized suddenly with a smart uterine bemorrhage, nearly fainted, and was conveyed Her medical attendant next day shed a rigorous system of low diet, or drink, full doses of landanum,

one of the uterus is not soon completely water; in addition to which a bag of chalk, moistened with vinegar, was introduced into the vagina. In a week matters had become much worse, and when I first saw her, she was unable to move, and almost without pulse, and shivering from being constantly soused in wet, and the mind depressed to the lowest degree of despair. I found excessive relaxation of the vagina, the os nteri so open that it would have admitted the points of three fingers, its lips tumid, but soft and puffy, and the body of the organ enlarged and doughy. I immediately had the wet cloths replaced with dry and warm ones, and ordered a jar of warm water to the feet, a scruple of ergot of rye in warm wine; jelly, good broths, chicken, and claret; tonics as in the former cases, and removal by-and-by into the country. She was soon much better, but had remained in town, and conceived again in June, and again miscarried in August, when I attended her; there was little hemorrhage, but the uterus was still relaxed, which I obviated by rest in the horizontal position for several days, a generous diet, and tonies. I also prevailed on her to go to the sea-side, her husband remaining at home. By the beginning of winter she had completely recovered, returned, conceived again, and in September 1835 was safely delivered of a daughter.

These facts promise to be useful from suggesting to us, in addition to other considerations, the obvious indication of using restoratives for the general powers of the system, the local application of tonic agents, and the use of specific stimulants to brace the uterus; but the chain of morbid actions can only be effectually broken by withdrawing the individual for the time from the possibility of conception, the uterus being, as is said in agriculture, allowed to lie fallow for a season. I have had a case in which this relaxed condition of the uterus was ascertained by dissection four weeks after labour, accompanied by profuse hemorrhage.

The nterus was found considerably larger than it ought to be at such a period after delivery (one month); measuring 44 inches in length, and more than 24 in breadth; its cavity would have contained an egg; the os nteri and cervix were quite open, and sufficiently relaxed to allow the introduction of my fore-finger; its parietes were about three-eighths of an inch thick, with the structure as soft and flabby as that of any other muscle in the body, so that it might be rolled round the finger, and when divided by the knife the vessels were found uncontracted and pervious.

There is a question which very often meets us in practice which it may be proper to notice here; ought patients who have experienced considerable hemorrhage in labour to be allowed to nurse? In my opinion they ought, if no other reason interfere, be-

of December that on the 5th of it appears to me very probable that chronic application, as a stimulus to contraction, and relaxation after early abortion (indepennent from its refrigerating power. With redently of hemorrhage) being so much more gard to the ergot of rye in cases of protracted frequent than it is after delivery at advanced menorrhagia, the specific action of that periods of pregnancy, is attributable to the remedy is strongly confirmative of a belief want of the manmary excitement. But the that those discharges are often dept, dent nursing we may find it necessary to pro- on the relaxed state of the uterine fibres hibit beyond half or a quarter of the usual we have been considering, constantly lead-period. Every day's experience convinces ing to a suspicion of organic uterine disease, us, that one woman will suffer more exhaus- a suspicion which a vaginal examination tion by three months' nursing, than will an rather tends to confirm, the organ being thus produced is, I have reason to believe, os nteri tumid and puffy; and I am strongly this very condition of the uterus. It is perfectly well known that when nursing disagrees, or has been too long continued, the dame Boivin, 23rd Plate, Fig. 1, which she prominent symptoms are precisely those describes as "a scirrhous tumefaction of the which accompany a relaxed uterus induced posterior lip of the os uteri, taken from a by other debilitating causes, and from examinations made under such circumstances, after an abortion in the sixth month. I have learned that the condition of the uterus which I have been describing is very frequently induced in a greater or less degree. In July last I saw a lady, of apparently sound constitution, who had been nursing for nearly seven months, and mesented many of the morbid effects of undue lactation, such as derangement of the digestive organs, pain in the back and left side, with almost constant slight red discharges, and occasional lencorrhora. found the vagina greatly relaxed, the uterns slightly descended, enlarged, and softened, and the os uteri sufficiently open to admit the end of my finger. Immediate weaning, attention to the digestive organs, tepid saltwater baths, tonics, and sca-bathing, soon completely restored her health. Dr. M. Hall says that "the uterus suffers," but he does not specify how. I have only to add to what he has said, that what "the uterus suffers" is relaxation, both of its tissue, by which its vessels are allowed to discharge their contents too readily; and of its connexions, by which it acquires a tendency to prolapse: and when patients who have unduly given milk, conceive within a short time, they very generally miscarry.

The remedies that will do most service are in these cases, preparations of cinchona, gentian, colomba chalyheates, mineral acids, country air, sea bathing, and cold topical ablution. Should the hemorrhage burst out profusely, the tampon with pressure, in-stantly, and the ergot of rye, are the means on which generally our greatest reliance ought to be placed. Occasionally an opiate, or the application of cold, may be used with advantage; but I cannot avoid observing, that the indiscriminate liberality with which both these remedies are applied in practice is greatly to be deprecated. A napkin is ing they can often soaked in cold vinegar and water, laid ground,

cause the mammary effitement which ac- on the external parts, and removed smokcompanies the early part of lactation, pro- ing with heat; this is only a pretence of dopagates its influence to the uterine system, ing good. The general principle on which promoting there active contraction. Indeed, cold should be used, is that of its sudden other by twelve; and one of the ill effects found increased in size, with the cervix and disposed to believe that this is really the condition of the uterus represented by Mawoman who died of pulmonary consumption,

POISONING BY HYDROCYANIC ACID.

By T. G. GROGHEGAN, M.D., Prof. of Med. Juris. to the Coll. of Surg. in Ireland.

THE particulars of the following instance of poisoning with hydrocyanic acid were related to me by the individual himself, and those who witnessed its effects: -

A gentleman, aged 21, being subject to uneasiness in the stomach, was induced to have recourse to hydrocyanic acid. He commenced with one minim of the acid of the Dublin Pharmacopæia (sp. gr. .998); this dose he repeated twelve times the first day, without any perceptible effect. On the following day he took half a drachm, on the third a drachm, which he repeated on the fourth day, and on the fifth day a drachm and a half; all without effect of any kind. On the sixth day he increased the dose to two drachms, and two minutes afterwards (a sensation of extreme bitterness being produced in the month), having walked a few paces, he experienced a feeling of great confusion, with headache, and loud ringing in his ears. With difficulty he retraced his steps, leaned forward on a table, became insensible, and then fell backwards, remaining in this state three or four minutes, during which time he was violently convulsed, and, to use the expression of the medica gentlemen present, affected like a poisoned with the acid. After come insensible, and while table, his thighs w extr

clenched, the solid sesqui-carbonate of am-convulsions frequently, if not generally, pre-monia was applied assiduously to the nos-cede coma. trils, and he was shortly able to swallow a lin the case detailed, vomiting was not little fluid. (Two drachms of the spiritus present at first. This symptom is mentioned ammonize aromaticus were diluted with a by some writers as indicative of a fatal terexception of pain and a feeling of distention favourable one. littewater to give to the patient.) Vouit- mination; but recorded instances affording supervened with great relief, and in reason for concluding, that although late in half an hour he was quite well, with the the order of symptoms, it is generally a by this extraordinary dose. The acid taken ing symptoms were dissipated on spontaneon the various occasions was diluted with one vomiting. In its toxicological relations water; the total quantity consumed being a there can be no doubt of the propriety of little more than six and a half drachus of classing it amongst the narcotic poisons, an acid, the per centage of real acid in though it seldom produces sleep. Its thera-which, according to Ure's table, should peutic action, however, appears to demon-be 1.5.* 1.5.*
strate the propriety of placing it amongst
The above case was witnessed throughout "sedatives," as has been done by Dr. A. T.

The property of hydrocyanic acid, been taken by accident, or for self-destruc- violent effects, appears to have been hitherto tion. In a paper on the treatment of this little noticed by writers, but it is obviously vol. 43, by MM. Persoz and Nonat, the consideration, whether under any circumsymptoms are divided into three stages; stances it can be considered as possessing 1. General malaise (or giddiness); 2. Tean accomplative power. Whether there be tanus; 3. Interrupted respiration, or what conceded or not to this poison a power of Orfila occasionally terms the stage of flac- accumulation, it should be borne in mind for cellity and insensibility, during which the many reasons, that minute difference in pulse rapidly fails, and finally becomes extinct. I have frequently observed animals to which this acid had been administered, acid presents the most extraordinary anomaperform rapid motions with the mouth and lies in its action. Thus, Richard knew a jaws, as if a powerful impression had been patient take even twelve ounces of laurel produced on the nerves of taste. Couling water, prepared by one of the first phar-(Paris, 1819) states that in experiments on maciens in Paris, in the twenty-four hours, his own person, he experienced from doses without any symptoms of poisoning. Dr. varying between twenty and eighty-six drops Montgomery failed in killing a cat with a of the acid (of Vanquelin?), an insupport-ably hitter taste, nausea, hurried pulse, and a half of the same acid (kept for three years longer) almost instantaneously destroyed a rat. In the great majority of experiments which I have made on the subject, young animals have been less sensible to its action than old ones. The interval which may clapse between the swallowing of the poison and the commencement of its action, became a question of great importance in the trial of Freeman for the murder of Judith Buswell at Leicester, April 2, 1829. Five drachms of the medicinal acid had been taken, and the bottle was found corked and wrapped in paper beside the hed of the deceased, who lay in a composed position. The question arose, could the deceased, after taking that quantity, have had time to perform the various acts which her position and surrounding objects indicated? In the instance detailed first in this paper, a ---tity equal to twenty-five drops of the

^{*} From a careful examination of two distinct portions, I assertiant of the per centage of real neid to be 60. Therefore the reported strength of the said of the Dublin Planmacoportal is 29 times that of the fail employed in 101s case; and the per centage of the acid generally used in Eogland, if correctly preared and carefully preserved, is five times as great, from ratenhation, however, grounded on the quan-try of materials employed, the strength of the acid if the Dublin Pharmacopech should be about three per cent.; the acid which was used in the instance nuder consideration was prepared from the ferro-cyanide of potassium, and it should be mantipued, at its chemical exantination was not umbrusken for weeks after its employment; it had been, and possessed strongly the charac It is also well known to an. com the ferro-eyanide
the atrong, will rethat of day, unthore than two

English acid, of thee per cent., commenced to act in about two minutes. Should twelve times as much, or five drachms, begin to operate in the one-twelfth of the time, or ten seconds? Within that period the acts of Judith Buswell could certainly be accomplished. A proportion not differing very materially from this may be found to exist. As to the smallest quantity capable of pro-ducing death in the case I have detailed, the quantity of real acid amounted to 7 of a grain, which was almost the same as that about her heart." The following notes were taken by the epileptics in the dreadful acci- taken as soon as she was placed in hed:dent which occurred at one of the Parisian Incoherent, very restless, uneasy in everhospitals, and by which seven patients lost position; pulse 80, soft and regular; tongue their lives. The case related in this paper clean; eyes clear; skin natural. On pla illustrates very strongly the beneficial effects cing the fingers lightly over the apex o of ammonia or its carbonate, in consequence the heart, a sensation is communicated of its stimulant powers. Chlorine, which to them not milke that which emphy decomposes the poison, most probably also sema of the cellular tissue would occasion effects a good deal by its stimulant action. Ent it is lost on the least increase of pres sure. Resonance very dall over the whole in this lost is reasonable to the control of in which this agent can be applied, is rarely of the precordial region; impulse consider at hand; at present, however, chloride of able as high as the clavicles, and peculiarly lime, or soda, is as likely to be easily pro- strong in the epigastrium; a loud bellow cured as any other medicine, and either of murmin over all the region of the heart these can be made to evolve its chlorine sometimes with a rasping noise; the latter rapidly by the addition of vinegar, or any of is best heard in the second sound, the for the ordinary acids. Very possibly after the mer in the first; vesicular respiration every patient has been to a certain degree restored where distinct. by the use of these antidotes, his recovery might be promoted by an emetic, and for and has not since spoken. this purpose the sulphate of zine, mixed liable to produce depressing effects, than some other medicines of the same class.

I add a few particulars of the dissection of a case which terminated fatally:-A schoolmaster of Dublin purchased an ounce of the medicinal acid (Scheele's), and swallowed it. Next morning he was found dead. The stomach in particular exhaled strongly the smell of the poison. The only morbid appearance of note discovered, was a patch of dark-red extravasation under the mucous membrane of the stoniach, near the pylorus; an appearance which seems to have been mistaken for gangrene, in a case related by Hufeland. This appearance I should conceive to be allied to the black warty extravasation observed in cases of irritant poisoning. The stomach exhaled the odonr for three days, at the end of which time the poison was detected by the usual means.— (Condensed from the Dublin Journal, Nov., 1835.)

DURATION OF PHTHISIS .- Of 114 cases, observed by Louis, rather more than twotenths died between the first and sixth months of the disease; four-tenths between me, as some medical fries the sixth and twelfth months; rather less than a fourth between the first and second years; and less than one fifth between the stupid, and second and twentieth.

PULSATION IN VEINS OF THE ARMS.

By CHARLES BENSON, M.D., Surgeon of the City of Dublin Hospital.

MARY OLIVER, æt. 60, of middle stature

Aug. 15. She became comatose last night

While feeling her pulse, I was struck with with some stimulant fluid, as wine, or brandy an appearance or pulsation in a samination with some stimulant fluid, as wine, or brandy back of the hand. Further examination showed a distinct pulsation in every superficial vein of the two upper extremities, but I could not feel it. Some of the pupils, however, assured me they felt it. The pul-sation was isochronous with that of the radial artery, but a little later, following it after an interval of time, which, when carefully attended to, could be satisfactorily appreciated. I could learn very little of this woman's previous history, though I sent an intelligent pupil to her late residence. He could only ascertain that for the last six months she had suffered very much from palpitations and headaches; that she was often intoxicated, and had often received wounds on the head, and followed her usual occupation (selling fruit) until a few days before; and that she was a Scotchwoman.

In the evening I took ten ounces of blood from her arm, and was surprised to find that it did not come per saltum, although pulsa. tion was observed in some of the veins below the bandage. The veins, after the bleeding, seemed much more diminished in size than I expected from the quantity of blood drawn off, and all pulsation ceased! This last circumstance dis visit her next ma was decidedly multuous.

16. Still comatore, but is very sensible to irregular slit-like opening, surrounded with timul? The veins are collapsed, and to- cartilaginous and osseous deposits. irtery 80; 90 when roused; heart's action as at first report.

19. Very little alteration, until this mornng, when her left arm and leg were found to be flexed, and somewhat rigid: The veins ned resumed their distended appearance, and pulsation was distinctly misible in all as it first. My colleagues and the hospital pupils now joined me in observing the pulsations. The veins rose and fell with the jected from the brachial artery, but not a respiration, becoming turgid towards the end of expiration, and flaccid when inspiration was nearly complete. In both states, however, their pulsation went on rerularly, heating as often as the artery, 80 in minute, but a little after it. There was no loubt of this, though the interval was very ninute. No change in the cardiac sympoms. The question as to the cause of the curious phenomena before us was now considered, and the discussion induced us to 1st, that the pulsation was derived from the 'eft side of the heart, sending on its blood brough the capillaries into the veins; 2nd, hat it was derived from the right side of the scart, and depended on regurgitation.

20. As blood-letting had benefited the of eight ounces the pulsation ceased. No doubtless, retard the rate at which the imnotion in the veins of either extremity pulse was transmitted. bould afterwards be seen. She died on the

ollowing night.

Autopsy twelve hours after death.

rom disease; not even congested. heart was at least twice the usual size. turicular appendages, especially the left, were remarkably large. The right anricle was dilated, and a little hypertrophied. The right auriculo-ventricular opening was very large and gaping. The right ventricle was lilated and hypertrophicd. Its cavity was wice as large, and its walls twice as thick 18 usual. The floating margins of the tricuspid valves were thickened, and studded with small cartilaginous nodules. The pul artery valves somewhat thickened, corpora sesamoidea much devericle was enlarged, and

ally devoid of pulsation. Pulse in the radial left ventricle was dilated, its walls a little thickened, but softer and paler than those of the right. The mitral valves contained calcareous and cartilaginous deposits. The aortic valves were greatly thickened, and filled with osseous matter. The aorta too had osseous deposits. Careful examination evinced nothing peculiar elsewhere in the whole body and vessels. One of the arms removed from the body was carefully inparticle of injection passed into the veins, The valves of the latter also resisted the passage of a fluid from a trunk to its branches.

I think the post-mortem decided the queson as to the cause of the venous pulsation. It is to the right ventricle that we must look for the efficient cause. This ventricle we find hypertrophied, and the auriculo-ventricular opening dilated; so that regurgitation into the auricle was inevitable; and as this would acte more particularly the circumstances of occur with considerable force, it is easy to he case. Two opinions were supported conceive how the impulse would be communicated along the dilated veins, even to their small ramifications. The valves intercepted the shock when the veins were flaccid; but in the distended state of the vessels the shock was sent from valve to valve, even by the very force with which they were patient before, a few ounces more were thrown across their tubes. And this may be It flowed distinctly per saltum, supposed to take place without any imperreterial in colour, but much thinner. The sephalic vein near the bend of the arm was sephalic vein near the bend of the arm was sephalic vein near the bend of the arm was sephalic vein the triple of the arm was sephalic vein near the bend of the arm was sound. The pulsation following that of the refered in order that it might not be inclected, in order that it might not be in arteries may be explained by the more yield-ing structure of the veins, which would, doubtless retard to recent which the control of the veins, which would,

Venous pulsation has very rarely been observed to extend beyond the jugulars. Hombert (1704) mentions a case in which the pulsation in the veins did not correspond in frequency to that of the arteries; that it was The laugs almost universally connected only to be observed during paroxyms of o the costal parietes by old adhesions. No asthma; and that the post-mortem exhibited luid in the plears. The lungs quite free great dilatation of all the cavities of the heart. The with thinning of their parietes, and large polypi extending from the ventricles into some branches of the aorta and pulmonary arteries. He attributes the pulsation in the veins to regargitation during the morbid palpitations of the heart, whilst the arterial pulse was occasioned by the regular action of the ventricle. Dr. Elliotson mentions a young lady with violent cough, in whom all the veins of the back of the hands and forearms distinctly pulsated synchronously with the arteries. This is all he says. Dr. Ward relates the case of a debilitated woman in whose hands and arms venous pulsation was observed for three days, but as the woman and the lining recovered there was no opportunity of deand opaque termining the cause. Dr. Davis relates a case in which the only morbid appearance it was an discovered on dissection was, that the left

ventricle was somewhat enlarged and firmer | vantage. Tepid drinks should also be given, than natural. Dr. Graves mentions two cases of venous pulsation; but he gives no details, nor does he offer any explanation of their cause. I do not think that either of the foregoing cases affords any proof that it depended either on the force of the left ventricle, transmitted through the capillaries, or on any independent action in the veins themselves. All the arguments in favour of either of these opinions might have been, and indeed were, advanced in the case v bich I have related. And yet the disse 'ion proved, I think, incontestably, that hy ertrophy with dilatation of the right ventrale, was the true cause .- Ibid.

NEW TREATMENT OF CROUP.

By Dr. KIRRY, Prof. of Med. in the R. C. S. in Ireland.

treating croup, pursued by Dr. Lehman, Staffend. The cough, which sometimes con-Surgeon at Torgan, consisting in the applications for a few days, appears to me to be in his hands when seasonably applied, and vantage. that it had been used successfully in several families, before his assistance could be pro-cured. My own personal experience for blood from one or both arms, or from the nearly twenty years in the efficacy of a some-jugular vein. Now, I am quite awarc of the recommend during the first hours of an atperspiration, which should be perfect; and
tack of croup. I believe there is a disposi- I believe that it not uncommonly disturbs families; and when one suffers, I think it diseases of the respiratory apparatus. prudent to examine the other members of the group, and advise such precaution as circumstances may suggest.

My first advice is, that the neck shall be surrounded with a flannel bolster of hot salt, probably be thus brought into a state of quickly heated to a temperature of which diaphoresis. I remember a remarkable inthe hand is impatient. A woollen stocking will do, not too tightly stuffed, to accommodate itself to the form of the parts fered from the highest inflammatory stage with which it is to lie in contact. The tempera- a patient of so great corpulency, I doubted ture of the whole surface of the trunk and my success, and therefore opened an artery is accelerated, with a fulness and softness and the alarming symptoms rapidly disapwhich promise a copious perspiration; and peared. when that is established, it is astonishing to witness the rapidity with which the uneasiness about the larynx, the almost pathognomic cough, and the cubarrassment an expression of of respiration, disappear. A triumph over venesection; the disease has now been obtained, but the withholds remedy is to be renewed, to confirm the ad- motes a thi

and even small quantities of cold water. which is exceedingly grateful, and eagerly wished for. The medicine I uniformly prescribe is a mixture of ammonia, saturated with vinegaz or lemon-juice, and a few drops of laudanum, the doses of which I alternate with two-grain doses of calomel and James's powder. Diaphoresis may thus be continued for twelve hours. It may then be allowed to subside, by changing the application less frequently, and employing a lower temperature. But these remedies should not wholly be laid aside for two or three days, or even for more, should there be any cough, or the slightest trace of preternatural laryngeal sound. While the perspiration continues, I do not risk its suppression by purgatives; but when it has nearly ceased, I administer tincture of jalap, magnesia calcined, electuary of scaumony, and water. This combination agrees well with the stomach, acts in small doses, and its operation is more certain than any other medicine I am acquainted The attention of the profession has been with. The discharges are sufficiently abunvery properly directed to a new method of dant, and the whole business is soon at an cation of hot water to the region of the best treated by low diet and mucilaginous larynx, at the commencement of the disease. mixtures, to which squill, hippo, and lau-Dr. Lehman affirms that it has not yet failed damum, are sometimes added with much ad-

The nature of the case had previously been over-disease was recognisable through the reclooked, and he now decided that not lithot- turn in patients under forty-five years of the but lithotomy ought to be adopted, and age; for as life advanced, the prostate beaccordingly performed. The mode came firmer and of a denser structure. regards the line of incision,

The PRESIDENT requested to know,

whether the bladder was much thickened; and, also, whether, in adults, Mr. Costello had found that the degree of thickening was proportionate to the straining which

calculous patients make.

Mr. Costello replied, that he did not believe that the bladder was prone to thicken, prior to pubcrty; no doubt, however, violent efforts of straining were a cause of thickening.

Mr. House asked, in what condition the bladder usually presented itself, when the calculi were found situated in the kidneys.

Mr. Costello presumed that this depended on the fact of that viscus remaining quiescent or active during the renal affection.

Dr. Appison alluded to two cases, which were designated cases of "irritable bladcommend is suited only to the period of in- |der;" where the sufferings experienced from the bladder during life were most exeruciating; although, after death the bladder was found to be healthy, and a strumous diathesis affecting the whole substance of the kidneys, was discovered.

Dr. RYAN requested to know from Mr. Costello, what was the earliest stage at which he would recommend the breaking down of the stones in children, and what was the carliest period at which he had found diseases of the prostate gland in

Mr. Costello answered, that the youngest advisable age was four years; he had performed it on a child at seven years of age, Junior President; Mr. F. Hale Thompson, and numerous cases were on record at the attended with less pain in children, than that of lithourity. As to the earliest period of life at which he had met with diseases of the prostate gland, he could say that in his Mr. Costello opened the discussion, by own practice he had not met with it in any

Dr. RYAN said he was aware that an enthe rule laid down largement of the prostate gland was the ocks, the first " condition of old age," as surgical writers nearer to termed it. He would next ask if Mr. Costello here stones had tried in these cases the use of iodine. He maring one had himself, in two cases, afforded considerable relief, especially to one sufferer, who | had been discharged from our public hospitals without deriving the least benefit from the measures there adopted; and who, although the gland was very much enlarged, obtained case from the disease very rapidly; and no doubt the cure would have been complete had the nationt, who was very poor, and resided a long distance from the infirmary, been able to continue his attendance. He believed that the injection of Whiting's account. iodine into the bladder, thereby carrying the substance into immediate contact with the gland, would produce much benefit.

Mr. Costello regarded ionine as beneficial in cases of simple engorgement; but of the abdomen, a large and prominent tuequal benefit would result from scarifying mour, slightly moveable, and evidently conthe gland. He would remind the doctor taining fluid, with three or four other tuthat the cavity of the bladder, although it mours, less distinct and prominent, all conwas lined with a nuncous surface, had not taining fluid, of various degrees of consistence, the power of absorbing injectious; in proof and reaching down into the pelvis. of which he would state, that if one grain origin was obscure, and the fact was uncertain of onium in solution were injected into the whether they spring from above, or (though rectum, it would produce more effect than more probably) from the liver, perhaps contwenty grains thrown into the bladder. He neeted with the ovaria. Some further remarks were made on the therapeutic powers of iodine in the treatment of diseases, and then the Society adjourned.

LONDON MEDICAL SOCIETY.

Monday, October 19, 1835.

Dr. WHITING, President.

ABDOMINAL TUMOURS.

THIS Society commenced its meetings for general treatment the tumous the winter on the first Monday of the pre- smaller, but more sent month; the 19th, however, being the Iodine had been first day of which we are enabled to report proceedings. On the previous Monday evening a case had been related by Dr. attachment

WHITING which was regarded as one of so much interest, that an opportunity was afforded, we believe, to the members to pay the patient, a young woman named Martha Collard, a visit. Dr. Johnson, it appeared, had availed himself of the occasion; and the report before us of his statements, and the discussion which ensued, runs thus, from which must be gleaned the particulars that are necessary to a general knowledge of or.

Dr. Johnson said he had found the young woman to be very respectable in her station, and communicative. On examining her person he discovered, deeply buried in the cavity tions. To an operation for their removal Dr. LEONARD STEWART Was desirous of the could not agree, -although, while profespassing a continual stream of fluid in and ledge of surgery,—and at the present moment out of the bladder, while the patient was he should refuse to assent even to the evalying in bed, by means of a peculiar appa- cuation of the fluid, unless it was designed ratus, in cases of mucous discharges from that the patient should perish on the table; Mr. Costello answered, that whether de-mulcent fluids, or an alkaline solution pre-pared with the liquor potassæ and distilled maintained that an hydatid tumour situated

peritonitis would assuredly result. Mr. PILCHER, under whose care Martha Collard was placed conjointly with Dr. Whiting, agreed that whatever propriety there might have seemed some months ago, when the chief tumour was less prominent, and did not fluctuate, in removing it, he was satisfied that if now attempted she would die; but still if she and her friends particularly wished it, he would have no objection to use the knife. If guided by his own judgment, however, he would puncture the mort prominent to remove its contents, establish a drain. Since she had been

Mr. Jones moving to

were not so extensive as was generally pre- | when in the erect position, and a dreadful concerved.

Dr. Johnson alluded to Lizars' successful removal of a gigantic abdominal tumour from a woman, where the incision could not have been less than fourteen inches in length. But where one similar operation succeeded, ninety would fail. Here the subject dropped.

CÆSAREAN OPERATION FOR THE REMOVAL OF A PETUS FOURTEEN MONTHS AFTER CONCEPTION

Mr. HUTCHINSON read a case of uterine pregnancy, in which the fortus was removed from the andomen fourteen months after conception. Mrs. J., aged twenty-eight years, of an active disposition and good constitution, had been married eleven years without having children; the catamenia were regular until August 1834, when they ceased, and she believed herself to be pregnant, in which belief she was supported by her medical gentleman, who found every symptom attendant on pregnancy. From the month of September her breasts enlarged considerably, a milky fluid was secreted in abundance, and the areolæ around the nipples were strongly marked. The uterns enlarged more rapidly than is usual in the early months of pregnancy, so that by the middle venience for a day or two after, from the portions of putrid skin and membranes. however, the abdomen continued to enlarge, and her legs became ordeniatous-From the latter part of May she gradually wasted, and the breasts and lower extremities fell to less than half their former dimensions, except the abdomen, which remained, as to size, stationary, but her general health suffered materially. Such was istory of the symptoms up to the 14th when the patient first consulthinson).

sense of suffocation when in the recumbent. On examination per vaginam, that canal was found to be shorter than natural, and its sides were compressed by the protrusion of a large tumour, occupying a portion of the pelvis, situated between it and the rectum, and the os uteri was indistinctly felt, the fundus appearing turned downwards and backwards, its mouth being forced up behind the pubes. On the 8th of July she was much altered for the worse, and yet more reduced; pulse 115, respiration laborious, tongue dry and furred, and the bowels constinated; constant vomiting; pain in the back; continual desire to micturate; she suffered also from frequent labour pains, and bearing down, with cramps in the legs, and her nights were restless. Ramsbottom now also saw her, and after examining the tumour externally, and by the vagina, he (Dr. R.) was of opinion that the case was one of ovarian disease, and that paracentesis abdominis ought to be had recourse to. On the 12th of July the Doctor and his father met, when, from the distinct sense of fluctuation communicated to the hand, he believed that there was ascites, complicated with ovarian enlargement, and the senior physician concurred in the propricty of evacuating the fluid without loss of September she was of very great size. of time. Accordingly on the 15th of July, She now suffered from pains in the back he (Mr. Hutchinson) introduced a largeand the region of the stomach, occasioning sized trocar through the linea alba, about syncope from their severity. During the two inches above the umbilious, where the next month the movements of the child tumour was more prominent, when about were felt, and it went on increasing in ax pints of a dark chocolate-coloured fluid size. After December the child was regularly felt, and seemed to become gradually not a fetid odour. This operation afforded stronger. At the end of April she was considerable and almost instantaneous reseized with periodical interine pains, at lief. Dr. F. Ramsbottom expressed surprise tended with strong hearing down, and she at the character of the fluid, having been then considered herself in labour, especially previously impressed with the conviction as the ninth month, according to her calculated that the fluid was contained in the peritolation, had arrived. The pains continued ucal cavity. At the expiration of a fortnight through the night, attended with a slight a lock of feetal hair escaped through the openbloody discharge, and after the passage of ing in the tumour, which had not healed, two or three stringy substances, they gra- and other pieces afterwards repeatedly passdually subsided. She suffered great incon- ed through, as well as globules of oil and restlessness of the child, after which the hard circumscribed tumour could now be movements were no longer sensible; still, felt through the abdominal parietes, in the left hypochondrium, evidently betokening the presence of the head of a child, and the nature of the case was then apparent to all. In September her symptoms became aggravated, and she suffered much from constitutional irritation. On the 21st of Septemher Mr. Hutchinson proposed to remove the feetal head, to which Dr. Ramsbottom objected, in consequence of the advancement of putrefaction, which would prevent an en-The symptoms tire removal of the remaining feetal substion, but the stance. Mr. Hutchiason, were not so physically speaking; but still, therefore, performed the operation, by en-larging the wound both above and down he had his doubts of her perfect recovery, wards, to the extent of five inches, Mr. Mayo owing to the ulcerative process which had assisting, who introduced his hand, and commenced in the alimentary canal, indigrasped the right upper extremity, which he cated by the presence of fecal matter in the brought out of the wound, but the cross discharge which issued from the wound in position of the futus prevented its being the abdomen. extracted without separation with the knife at the shoulder-joint. Then followed a foot, and afterwards the tronk, but the head was too bulky to be brought away entire. The funis was divided. A portion of it with some membrane was left bauging out of the wound. On examination the placenta was found to be still adherent, and it was not removed. The wound was simply dressed and poulticed, and an opening was left in the lower portion of it, to allow the free exit of any fluid which might still remain in the cyst. The fectus was as large as an ordinary feetus at the full time of utero-gestation, and the cuticle was entire, except over the scalp. On the 24th of the month the patient had passed a good night, expressed herself as being much relieved, and appeared to be cheerful; the pulse 115, but evidently excited by the presence of the medical gentlemen; she was free from rigors or sickness, and experienced no pain in any part of the abdomen; the bladder and bowels spontaneously acted, and no medicines were prescribed. On the 25th the placenta was removed through the aperture, and had the appearance of baving been macerated for a long time in water. On the 2nd of October, a slight gastric uncasiness supervened, but decreased until the 8th, when she was attacked with constant pain on the right side of the abdomen, with sympathetic fever, but fomentations and salines afforded relief from these, and since then the general symptoms have remained the same, although the countenance has decidedly improved; the discharge is occasionally feculent, but granulations have sprung up, and the wound now does not extend to more than about half an inch in length. The softness of the abdominal parietes has entirely disappeared, and the poor sufferer appears to be in a fair way of restoration to health.

The unanimous thanks of the Society were returned to Mr. Hutchiuson for the detail of the case; remarks were offered upon it by several gentlemen, but these we withhold from publication in the present report, as every reason existed for expecting that others would be given at the next meeting, for at the hour of adjournment, seven or eight members were on their legs evincing anxiety to speak on the case; and it will be better to review the whole at once. One of the learned members observed,

surgeon, who concurring with Mr. Hutchin- that the various opinions formed by the

THE LANCET.

London, Saturday, October 31, 1835.

If we were to congratulate the profession, the public, and, above all, the parents and guardians of the eight hundred children who are domiciled in the town and country establishments of Christ's Hospital, on the election of that candidate for the office of resident surgeon, who, from his age and manifold professional qualifications, was the best fitted to discharge the highly-important functions of the station, we should, we regret to say, offer those congratulations on an event which has not occurred.

The cause of inhumanity, of injustice, and of intrigue, have once more triumphed in a medical election; but that triumph is so tainted and tarnished with disgrace and dishonour, that it has given the last stamp to the expressive seal which is attached to the decree of fate wherein is proclaimed the downfal of our entire system of hospital and medical misgovernment. There are upwards of four hundred governors of Christ's Hospital,-gentlemen of affluence and elevated station in society, who have become electors through the payment of a subscription of 400% each, or of 200%, through being the nominces of aldermen, - who, being aldermen, have become governors ex-officio. These gentlemen, insta electing Mr. PLUMBE, who gaged in the pres ing a period his tin

of pathology during upwards of twenty-six | pital without being educated, in consequence years, who for a long period was the of the check and interruption which their senior-surgeon of the Metropolitan Infirmary for Children,-and who, besides, is the well-known author of an approved work on the diseases of the skin,-these wealthy, respectable, disinterested, and discerning governors, have turned aside and spurned a practitioner thus qualified and recommended, in order that they might place in the office of resident-surgeon of the hospital, a wonth of the name of Thomas Stone, an assistant in the apothecary's shop of St. Thomas's Hospital! After such an exhibition of -we really know not what to term it,-on the part of the electors, we feel no hesitation in asserting that it is the bounden duty of Parliament to take from the governors of the whole of our medical charities, that patronage and those functions which they now enjoy and exercise in the appointment of medical officers. On the institution of a National Faculty of Medicine, the transference of the powers which, up to the present time, have, in almost all instances, been so improperly exercised by the lay governors of our institutions, to a high, an efficient, and a competent authority, would not only be a matter of easy accomplishment, but would be rendered an imperative act of duty.

Leaving corrupt and all other indefensible motives out of the question, what do we observe in the election which has just terminated? Why, the supineness alone which has been manifested by the governors, would call for and warrant the interference of the Legislature. Good God! How can such men pretend that their proceedings are influenced by motives of charity? They know that the boys in the establishment have been suffering intensely for above a quarter of a century from that scourge the ring-They have seen that their medical it not in their power to remove

we known that hun-

for the full

scholastic pursuits received from the ravages of the contagious scourge; and yet, with a knowledge of all these distressing and painful disasters, only a fraction more than one-third of the governors attended to give their votes at the election, and, strange to remark, the favoured candidate is a youth of twenty-four, and the second on the list is a youth of twenty-three years of age.

On what principle, then, did they proceed

in the contest? Really we are compelled to state, and it is with pain that we place such an allegation upon record, that the governors appear to us to have been influenced by every motive and consideration, save and except that of feeling the slightest interest in the welfare of the children who are committed to their charge. Only a hundred and fifty-seven votes were given on the occasion: yet there were ten candidates. every one of whom had some supporters,the winner who gained the victory in this extraordinary contest, obtaining only thirtynine votes. Three or four of the candidates had ten and twelve votes. Others had seventeen and eighteen, and so on; indicating in every instance the exact force of that degree of private family interest which could be employed in their favour. The circumstances, taken altogether, on being presented to the public view, render it a most lamentable and disgraceful exhibition. If the governors will but examine the oath which they take on being admitted to the hospital. they will scarcely centend that they do not falsily the spirit of that oath, if the whole of their official conduct be not regulated by an carnest desire to employ the funds of the hospital to the greatest advantage for the children. The terms of their oath are calculated to nullify every feeling of self-interest on the part of the governors. The ob. ligation, in fact, enjoins, directly, the most conscientious and scrupulous discharge of their duty. In connexion with that sacred left the hos- injunction, therefore, voluntarily undertaken. let us set before the public, and the LAURIE, are now called upon to make. parents and guardians of the children in possibly, a sacrifice of their health, and of Christ's Hospital, the words of Sir Peren many, if not of the whole, of their worldly LAURIE, an alderman and magistrate of the interests, on account of benefits which were City of London, and one of the governors conferred on the ex-ufficio governor. Even of Christ's Hospital. Let us take the words the ballot, powerful shield as it is against of this occupant of the judgment-seat, - corruption, furnishes no security for talent of this manager of a great public charity, or honesty, when men choose to be governand by those words let us test the conduct, ed in their conduct by such motives as have the disinterested and henevolent conduct, of been exemplified in the behaviour of Sir his brother voters. We shall give his words PETER LAURIE. At any rate the worthy in a dialogue which occurred between Sir knight was frank. He stated why he gave Peter and one of the candidates:-

calling to solicit the honour of your support Hospital.

his vote to the youthful and inexperienced CANDIDATE. - Sir Peter, my name is candidate. There was no disguise about , and I have taken the liberty of him, and instead of attempting to justify in the election which is about to take place his conduct, he offered an apology for his for the office of resident-surgeon in Christ's vote,-the only excuse which the circumstances could seem to warrant. The fether miliar to me, sir, but I am sorry to say that of the candidate had served Sir Peters LAURIE, and therefore the vote was given for the son. The health, the happiness, and the well-being of thousands of children. for many years to come, were items so triffing, insignificant, and unimportant, in this affair, they were not deemed worthy of that institution, we suppose, must all be

Gloomy as is the picture which this disclosure presents to the view of the moralist, yet it contains one point of relief. What chance has merit in an electoral Thomas Stone was not an assistant discontest when motives such as these can in- penser in the apothecary's shop of St. Barfluence the conduct of the voters? Sir thalamere's Hospital. The Vincents, the PETER LAURIE, on examination and reflect Stanleys, the Lawrences, the Hues, the vote for one hundred pounds, the tendency feated in their attempt to plant another of enemy as the ringworm. A new officer, therefore, is selected, from another establishment, and let us hope that the improved system of diet and treatment which was recommended by Mr. Plunks when he was consulted by the Special Committee, will not be disturbed by Mr. Thomas

Tonk.

from Mr. Tarbutt, one of the Governors of the hospital, that not one of the royal or endowed hospitals or charitable establishments of this metropolis, should be excluded from the operation of the new Charity Commission Inquiry. Since the year 1816, whenever the Act for reviving the Commission was renewed, it was always managed

But some sad misgivings oppress our thoughts on this subject. We fear, indeed, that the assistant-apothecary of St. Thomas's Hospital was chosen by King HAR-RISON and his brother treasurers, because the vonth has shown that he is endowed with that pliability of disposition which will always render him subservient to the word of command in the office of apothecary to Christ's Hasnital. Such a quality of mind was held, we believe, by the majority of voters on this occasion, as infinitely to be preferred to a knowledge of the diseases of children, - a supposition which received some show of confirmation from the fact. that Mr. Eyseniys Liovo had threatened to resign his office if Mr. Peumbe should be called upon to discharge the duties of resident surgeon. The importance of this threat may be estimated by the governors, as, also, may be the value of Mr. Laoyo's survices; though, for ourselves, we are utterly at a loss to understand the weight of either the one or the other, more especially after having observed the miscrable figure which Mr. LLOVD has cut in his ten-year fight against the ringworm. Fortunately, then, as the assistant dispenser of St. Thomas's Hospital is elected to the office of resident surgeon in Christ's Hospital, Mr. LLOYD will not carry his threat into execution. He will not resign the office of visiting or consulting surgeon, which is a subject of congratulation for posterity.

We cannot conclude this subject, and take ur leave, for the present, of the Governors toppilal, without expressing our hose Ministers of the presentation Commons,

of the hospital, that not one of the royal or endowed hospitals or charitable establishments of this metropolis, should be excluded from the operation of the new Charity Commission Inquiry. Since the year 1816. whenever the Act for reviving the Commission was renewed, it was always managed in the exemption clause, to provide that the affairs of certain of the hospitals should not be made the subject of investigation. In the Act which passed the Legislature at the close of the last session, and in which measure it is ordered that the inquiry into the whole of the remaining institutions shall terminate in, or before the commencement of, the month of March 1837, -only seventeen months from the hour in which we write,-no such nefarious exception was allowed to be introduced. Even in some of the institutions where the inquiry was not pushed so far as the demands of public justice required, it will be renewed and prosecuted with the utmost vigour. The pecuniary and other concerns of Christ's, St. Bartholomew's, St. Thomas's, and Guy's Hospitals, will soon be subjected to a scrutiny which cannot be concluded without advancing the best interests of those great national institutions. Had there been less of jobbing in some of those establishments. less of corruption in electing their medical and other officers, they might again have been included in the exemption clause of the new Charity Commission Act; but as their aluses had become too manifest and odious to be defended, they are committed, without restriction or complaint, to the scrutinizing researches of the Commissioners appointed by an executive government, the members of which are pledged to promote and support the cause of national medical reform.

In placing the letter of Mr. Rumser (page 187) before the practitioners of medicine in this country, we feel called upon to express a hope that the questions which

have been proposed by that gentleman will Lincoln's-Inn-Fields. The members of the not remain unanswered by his professional junto, the self-perpetuating clique of twentybrethren. With reference to the subject one, have passed over the name of Mr. W. of his communication we can only observe, Kingdon, in the list of members who are that the proceedings which are still manifested in several of the Unions relative to thus insulted Mr.W. Kingdon has shared the medical contracts, are altogether at variance with the assurances which were given, both to the Kent deputation, and to ourselves, by the noble Lord the Secretary of State for commonalty. Be of good cheer, then, Mr. the Home Department in the House of Commons, and by the Poor-Law Commissioners at their apartments in Somersct-House. The There is one more reformer who we could Commissioners contend that the Board of not so have named had the Council been Guardians are at liberty to make as many contracts with medical practitioners as they Mr. Kingdon being one of the "quiet and may think proper, and we have every rea- the peace-lovers," he would have remained; son to believe that this allegation is strictly stranger to the exertions which reformer: and faithfully correct. He wa We will take care that this subject shall elected. He is one of the set. He acts with them, he sits with them, he persecutes with them, he prosecutes with them. And wher is WILLIAM LAWRENCE? He is THERE and THERE only. It is the burial place o his reputation. No. no. Mr. Kingpon, Hayou been elected, your character for honest would have been lost. You now preserv your integrity, at a cost of three hundre pounds a year; and considering your high regard for the honour of your fame, yo will feel and acknowledge with us that th receipt of the pounds sterling would hav proved but a sorry recompense for the

At the great meet

of your character for integrity

- "firm but respectful remonstrance to the subject with your "hats off," and a report of " heads of the College, -a firm but respect-
- " would achieve the object that the members
- " of the College had in view."

Before we say another word to Mr. KING-DON on the subject of his exclusion from the Council, we commend to his notice the brief speech that was delivered by him at that meeting :-

"Mr. KINGDON.-1 think we had better proceed to remedy the evils we now feel, than go to evils that we know not of. It appears to me that there is great inclination on the part of those gentlemen who are at the head of the institution, to redress the evels of which we now complain. cries of "no," and marks of disapprobation.) Gentlemen, it has been said that each member present has a right to express his opinion with respect to the business upon which we are met; and, certainly, upon a subject like this, if he can by possibility have more than a right, I feel that he has more than a right to express his sentiments. (" Hear, hear." And I do repeat that such strong resolutions, coming from such a meeting as is here, will have such a tendency on the conduct of those men at the head of the institution, that a remonstrance made to them, firm, but respectful, will procure a redress of our grievances. A firm, but respectful remonstrance in that quarter will have the effect of remedying the evils complained of. (Applause and disapprobation.) And I beg of those gentlemen to consider well how they hastily throw off from themselves their present charter, for, if they let it slip from them, they may get that which will interfere with them a great deal more; and I cannot help thinking that the objects of the profession will be best promoted by their doing that which this meeting seems inclined they should do, and which a respectful remonstrance will have the effect of procuring."

What say you now, Mr. Kingpon? Was a "remonstrance" the appropriate remedy? Really we are anxious to know what you would have said of the conduct of the College, or of the constitution of the Council, if you had been chosen one of the Council--if (that is), by your premeditated rou had been enabled to pocket per amum of the LAWRENCE ence on this

the proceedings at the conference shall ap-"ful remonstrance in that quarter, - a pear in the pages of THE LANCET, for the " firm but perfectly respectful remonstrance, benefit of the uninitiated members of the protession.

> A CORRESPONDENT informs us that some blockhead of a lecturer has been accusing this Journal of being influenced by its selection of articles for insertion in its pages, by the tender of pecuniary bribes. As the writer has promised to send us the passage in print, we shall refrain from saving more on the subject until we see the specific charge. Accusations of such a character, however, are by no means unacceptable. Every ass thinks his own bray the best, and if his paper be not received, attempts to account for it to his friends by saving that "his " purse is not long enough to ensure the " insertion of his communications."

We rely on the performance of the promise of our correspondent.

QUESTIONS

RELATIVE TO MEDICAL ARRANGEMENTS UNDER THE

POOR-LAW AMENDMENT ACT.

To the Editor of THE LANCET.

Sir .- At the last unniversary of the Procincial Medical and Surgical Association at Oxford, a committee was appointed to consider and report on the best means of affording medical relief to the sick poor, especially with reference to the Poor-Law Amendment Act.

As Secretary to this Committee, I am desired to solicit you to further their objects by inserting the present communication, and by supporting it with such arguments as your own just views of the subject may suggest.

The lamentable effects of recent measures. both on the sick peor and on the medical profession, and the determined attempt to continue and to justify them, evinced by the last report of the Poor-Law Commissioners (dated August 8th, 1835), demand the most decided and unanimous conduct on the part of the profession. Our opposition will, however, possess but little moral force, if it

be not supported by substantial reasons, and these reasons can only be deduced from a correct and ample compilation of facts, which, unfortunately, exist in such profusion where the new law has been carried into effect.

These considerations will, we trust, induce our professional brethren, residing in those parts of the kingdom already under the operation of the Poor-law Amendment Act, to supply us largely with answers to the subjoined queries. By so doing, the labours of this committee will be rendered more efficient, and it is hoped that, in consequence, a more suitable, a more just, and a more humane system of parochial medical relief will be adopted. I am, Sir, your obedient servant,

H. W. RUMSEY. Secretary to the Committee. Chesham, Bucks, Oct. 26, 1835.

The subjoined questions are addressed to individual country practitioners.

- 1. What has been the mode of appointing and paying medical officers of parishes in your neighbourhood for the last few years?
- taken place since the introduction of the Poor-law Amendment Act?
- vided for the poor as formerly?
- district or districts entrusted to the care of one medical officer?
- 5. What is the greatest distance of patients from the medical officer, and is that distance greater or less than it was under the old system?
- 6. How are orders for medical relief obtained in ordinary cases? and how in urgent?
 7. Have "tenders" been required? and

extent:

8. What are the amounts of the stipends? Are they fixed annual sums? or are they payments per case? If the latter, is any gradation, according to the numbers or distance of the patients, allowed? and is any limitation to the sum total exacted?

9. Are the forms of the contracts in any of their clauses degrading to the respect-

ability of the profession?

10. Have there been any instances of distress and danger to the sick panpers, and to what direct causes are they attributable?

11. Are there any other particulars, bearing on any of the above questions, that occur to you as being worthy of remark?

As the prosecution of this inquiry is likely to be attended with considerable expense, it is suggested that, on public grounds, communications addressed to the Secretary legal ineligibility to should be post-paid.

EXCLUSION FROM THE COUNCIL OF THE LONDON COLLEGE OF SURGEONS.

To the Editor of THE LANCET.

SIR .- Will you have the goodness to grant insertion of the accompanying letter in your Journal of next Saturday, and oblige, Sir, your very obedient servant,

W. KINGDON.

2, New Bank-buildings, Oct. 26, 1835.

TO THE MEMBERS OF THE

MEDICAL PROFESSION.

GENTLEMEN,-Having of late been treated with injustice by the majority of the Council of the College of Surgeons, and having learnt that he who tacitly submits to injustice becomes an instrument to his own degradation, I take this, I believe the most proper, method to protest against the measure of exclusion which has been practised towards me. Thinking that such a body would not willingly treat any one with in-2. Has any alteration in the above mode justice. I suspected there must have been, anknown to me, some disparaging report abroad, and therefore addressed the Presi-3. Is an equal number of medical men pro- dent and Council to inquire if, to the belief of any of them, such report existed. 4. What is the population or extent of the some time I received an answer avoiding the question, and thus in effect admitting that if they allowed me an unsulfied reportation, they damnified their own conduct. On the same showing, however, their conduct was calculated to damnify my fair fame,--more valued and estimated by me, as more essential than life itself to the welldoing both present and future of myself and Without power to question this tamily. have they been furnished? and to what conduct, shielded as it is by charter, granted we may presume by a gracious sovereign, for the benefit and not the oppression of his subjects, I still have the power possessed by every English gentleman to see that my reputation do not suffer by the partial or selfish conduct of others, and it is for this reason that I now address my professional brethren. After more than twenty years of public and private practice as a surgeon in London, I must be known to some of you; and I address you to intreat that if any of you know, or think you know, anything disparaging to my character, you will have the goodness to inform me, and thus confer the greatest favour that man can confer on man; for I am conscious that any such disparagement need only to be made known, to proved as resting on misappreha founded on falsebood.

render

my College, 1

imply that L tensional o

for election. respecting me, given to the Parliamentary Committee by the then President of the College (which he afterwards made all endeayours to correct that gentlemanly feelings could prompt), has been deemed a sufficient cause to throw me out of my fair professional course; or unless my not having an hesitate to tell him that the amount of adinterest in common with surgeons of hospital, or a mind easily led to surrender its own views and see things as others wish, be deemed a sufficient cause, and neither of these can be supposed to influence the minds of honourable men, I must remain under the stigma of exclusion for my own demerit, did I not make this appeal to my professional brethren, so as to make known to them that on the majority of the Council rests the responsibility of having used their power unjustly. Such conduct needs only to be canvassed, for the reprobation of the right-thinking to fall on those who practise it : and I have felt it my duty to offer my character for the strictest investigation, in order that the majority of the Council may have the benefit, if anything can be found against it, as an excuse for their unprofessional and unjust conduct. It is the conduct of such men that drives the quiet and the peace-lovers to seek and enforce change. It is the conduct of such men that renders futile the best efforts of the honourable and the able to place the affairs of our country on a footing of fairness and stability. I am, gentlemen, very faithfully yours.

W. Kingpon. 2. New Bank-buildings, London, Oct. 26, 1835.

ENGLISH EDITION OF LEBAUDY'S PLATES.

To the Editor .- Sir, - I was happy to find in the notice which appeared in the last number of THE LANCET, on the Anatomico-Chirurgical Plates of M. Lebaudy, that the only objection against the work related to the price at which it is published. By correct information as to the number of plates contained in the fasciculus sold in Paris, and considerations of the expenses necessarily attending publication in England. I feel assured that the writer of that article will soon be convinced of his mistake in estimating my profits on so exorbitant a scale, and I shall trust to the known character of your contributors in general, for a contradiction of this imputation against my racter as a man of fair and honourable The fasciculus of plates published of twelve plates (not lish copy contains), exper, without

d the duty

Unless erroneous information | upon them, let the writer add that of translating, printing, and putting into boards, and he will find, after defraying these expenses, that my profits are by no means exorbitant. In case, however, the writer of the notice in question have not the data for making the estimate I mention, I do not vantage I derive from the sale of each copy of the Atlas, to the trade, is precisely three shillings. Trusting that you will do me the justice of inserting this in your next number, I remain, Sir, your obedient servant, J. B. BAILLIERE.

219, Regent-street, 27th Oct., 1835.

WESTMINSTER HOSPITAL.

THE officials of this establishment have abandoned their old and ruinous abode in the smoky region of Petty France, and have domiciliated themselves in a spacious edifice in the broad sanctuary on the north side of Westminster Abbey. Of the architecture of this building the critics say that it is of the "Tudor collegiate style." The plan of the architects may have been laid to complete the building in that fashion, but the funds of the building committee have not been extended far enough to perfect it. The pile, as it stands, is typical of the Hottentot Venus, having an apron of ornament in front, with the back and sides in puris naturalibus. 2501. would have sufficed to cover the nakedness.

REMOVAL OF A LARGE MALIGNANT TU-MOUR OF THE CHEEK WITH A PORTION OF THE BONES OF THE PACE.

SATURDAY last was regarded as a regular "field-day" at this institution, in consequence of the performance of the above operation. In perambulating the wards, we observed a case of scrofulous disease of the ankle-joint, one of necrosis of the tibia in a child, in which, considering the small portion of bone removed, the wound appeared to be outrageously large; there was also a case in preparation for lithotrity, and one of severe burn and scald of the left lower extremity, which was covered with large vesications, and small collections of matter were forming and burrowing under the muscles. One of these was, in the language of the surgeon, ordered to be "scratched." " Now, sir," said Mr. GUTHRIE to a pupil of St. George's Hospital who was present, "show the young gentlemen into the operating theatre; let them get on the upper seats, and leave the lower one for the old men, the white-wiga." In a few minutes the operator entered, followed by the rest of the hospital staff, amongst whom were Messrs. STANLEY and KEATE.

visit to the patient in Queen Anne's ward, where we found a pallid female, about fortysix years of age, lying on her bed, wrapped in a flannel gown. This female was to become the subject of the proceeding.

molares also lost their hold. The facial tumour likewise steadily increased in size, assuming a conical shape. In March last she applied at a dispensary in the country, recommended to come to London. Soon after her admission into the Westminster Hospital, Mr. Guthric made an incision into emancipating some pus. This aperture did not close, but communicating with the subjacent disease, became fistulous; the fetid sanious discharge fell into the mouth more profusely, and being swallowed, produced nausea and vomiting. In this way her appctite was destroyed, and the constant lancinating pain in the tumour broke her rest. She has recently become much emaciated. The catamenia have been irregular for four years. During the last year they have appeared four times. The bowels have uni-formly acted well. Since her admittance pointed knife. the scope of the treatment has been merely alleviatory. Some difference of opinion existed among the surgeons as to the propriety of the operation; but, it being determined in the affirmative, Mr. Guthrie made prepa. discased mass, was rations for its performance.

The patient was placed in a chair, having terior order the head supported on pillows, and kept employments

Previous to the operation we paid a brief | steady by an assistant. A vertical inclaion was made through the integuments, extending from just below the tendon of the orbi-cularis palpebrarum muscle, to about half an inch within the angle of the mouth, which divided completely the upper lip. By this Her name was Mary Brown, and she had incision the coronary branch of the facial been for some years a resident of Codicol, artery was divided, and a little hemorrhage in the county of Herts. She was admitted was produced, which however soon ceased. into the hospital under the care of Mr. Another incision was carried somewhat shouthrie, on the 8th of July, 1835, with a liquely outwards and upwards, so as to tumour on the right cheek. She has been avoid the parotid duct, towards the lobe of married and has had fourteen children, of the ear, and a rhomboidal flap of integuwhom six survive, and are, apparently, unment was then obtained, by making a third

In the course of last spring the bony tissue. By this means the max-she found clots of blood descending into illary sinus was of course had open, and its the mouth from the teeth, two of which posterior wall exposed, which was found fell out; afterwards the bicuspides and involved in a similar state of disease. Mr. Guthrie now divided the zygomatic process of the jugal bone by a stroke or two of the mallet and chisel, and by the same means separated its ascending orbital process from where she was supplied with a lotion, and the external angular process of the frontal, which did not require any great degree of force, owing to the softness of the osseous tissue. In this way the bone was perfectly the apex of the tumour, for the purpose of freed on the outer side from any attachment to surrounding parts. Directing his efforts in a similar manner to the inner side, the maxillary and palatine bones were separated from their fellows in the line of the palatine suture, by insinuating the chisel between the two front incisor teeth. An opening being made into the right nostril by piercing the cartilage of the ala nasi, the masal bone was separated by the chisel from the nasal process of the superior maxilla, and the lachry mal bone and the orbital plate of the ethmoid were cut through with the blunt-

The superior maxillary nerve where it lies in the spheno-palative fossa, having first carefully divided with the GUTHRIE, by placing hi its situation calpel was

as effected with considerable difficulty, in assequence of the impediment caused by e motions of the tongue. When the mass as brought away, part of the posterior igle of the diseased sinus, where it often mmunicates with the ethmoid cells, was und to be left behind, and required sepate and rather tedious dissection, as did adpart of the glandular structure of the ft palate, and the amygdalæ, which had articipated in the disease; as well as a poron of the pterygoid plate. Here of course ie greatest care was incumbent on the perator, from the proximity of the carotid, hich he afterwards stated he was in great ar of wounding. Upon the division of the ranches of the internal maxillary artery, me hemorrhage occurred, which occaoned a good deal of distress to the patient, y the blood accumulating in the fauces. was, however, expelled by the expiratory forts, which were increased in violence as ie blood accumulated. The mouths of the ivided arteries very quickly contracted, ery little blood being lost during the operaon, and not a single ligature being required. Ir. GUTHRIE now requested Mr. WHITE to camine the surface from which the tuour and its excrescences had been reloved, in order to ascertain whether any estige of it remained behind. A little was etected at the upper and posterior angle of ie cavity, most probably in the walls of the pheroidal sinus, which being seized with a ook, was, after a little tedious dissection, moved. The bone was afterwards scraped. The removal of the disease now being acamplished, and forty-five minutes having lapsed, the patient was allowed to rest a ttle, and some wine was administered. ler wet and bloody linen was removed, and ac was placed in a bed which had been rought into the theatre for that purpose. he edges of the divided integuments were rought together, and retained in apposition, -in the situation of the outer incision, by neans of two or three stitches of interupted suture, metallic wire being employed viously. istead of silk; whilst the incisions in those arts of the check and lips which were unupported by any subjecent bone, were losed by means of the twisted suture, about ve hare-lip pins being employed. A little imple dressing was laid over the check, and bandage was lightly applied.

The operator was assisted by Mr. THOM-ON and Mr. SOADEN.

Although the operation lasted forty-five sinutes, it was borne by the patient with a

scessary to remove these connexions, which | " I want something "that will cut here!" "A pair of curved scissors!" "A hook!"
"A blunt hook!" "A curved hook!" "Hot water here!" "A sponge!" "My little short scissors!" and sundry others (not all of them the operator's exclamations), which were occasionally varied by, "You bear it very well, my dear lady!" "It is almost done!" "By the blessing of God, my dear soul, it is nearly over!" "Give her a little wine!" "Don't go yet, STANLEY, I want you to see it quite done!" These remarks were throughout accompanied by the clanking of scalpels, knives, and scissors, in a pewter basin, close to the patient's ear, producing altogether a discord more horrible and distressing to the sufferer than we have ever witnessed before, or hope ever to witness again.

> Tuesday morning, Oct. 27 .- No antoward symptom has occurred since the operation. The patient slept for two hours immediately afterwards, and has since been free from restlessness or febrile excitement. She has taken nourishment, chiefly warm milk and arrow-root, and, at her desire, occasionally, small quantities of wine and water. Deglutition has been performed with very slight difficulty, and respiration not at all affected by the operation. She has taken no medicine, but it has been necessary to keep the bowels open by injection. The wound is every where uniting, the skin is sound, and round the fistulous opening in the cheek rapidly recovering its healthy appearance. There is slight tumefaction of the lids on the outer side of the orbit. The pulse has continued at 120, the same as before the operation, no variation being detected until this morning, when the beats amounted to 102, which are regular, and more sthenical. Some time after the operation, on attempting to speak, the expectorated breath distended the affected and boncless cheek in a hideous manner, but this we understand does not occur now. The patient states that she has been much easier since the amputation than she had been for some time pre-

ST. THOMAS'S HOSPITAL.

CLINICAL LECTURE

ON THE

DELIRIUM TREMENS.

(Illustrated, in part, by a Case reported at page 161),

DELIVERAD BY

DR. ROOTS,

On Monday, November 2, 1835.

You may remember, gentlemen, that when I last had the pleasure of meeting you, I concluded with an avowal of my ignorance of the precise condition of the brain and nervous system in that particular disease which is called "delirium tremens."

With respect, then, to the termination of the disease. Sometimes, if the attack has been very slight, the disease will run on for three or four days, or more, the patient will fall into a profound sleep and awake comparatively well. This, however, is not a very frequent termination, when unaided by medical means. More commonly, and more especially if it be a second or a third attack. the symptoms will increase in intensity, and perhaps terminate in convolsions, of an or two more recurrences of these convulsive attacks. It may terminate in apoplexy, and occasionally it will terminate in mania. The latter, however, certainly is not a common termination, but still it is an occasional termination of delirium tremens.

Prognosis .- Then as regards your progis; if it be a first attack,—if the constitunot been materially enfeebled, generally be favourable. ore doubtful in proed comittion deful if it

increased if, in addition to the irritation, you find accompanying it inflammation.

Diagnosis .- Then as regards your diagnosis. This is certainly a subject of the greatest importance, because upon the correctness of your diagnosis, will depend the DIAGNOSIS, PROGNOSIS, AND TREATMENT probability of your patient's recovery. If you should by chance mistake true delirium tremens-and I am speaking now of the true form of the discase, - and treat it upon the principles of inflammation of the brain, the chance is that you will destroy your patient's life. Well, then, the history of the case, the history of the patient's previous babits, whether he had been addicted to the abuse of spirituous liquors, or of apium; or if to neither of these, whether, having been exposed to great bodily privations and mental anxiety, the disease had supervened upon them. Next you must bear in mind, in true delirium tremens; the absence of the flushed countenance, the absence of the suffused eye, the absence of excessive heat of head, the tremor (the general tremor of the body, to a greater or less extent), the tremulous condition of the tongue, and also its moist creamy coat,-these things being considered in connection with the state of the pulse, which is perhaps at first rather slow and soft, speedily getting quick, but still soft; and, in addition to all these, the peculiar illusion of the mind-the illusion in true delirium tremens being perfectly different from that which is observed in inflam-mation of the brain. The patient here, it epileptic character, occasionally, or perhaps is true, is suffering under an abberration of frequently, recurring, until the patient dies; mind, but it is that which is easily conor it may terminate in apoplexy, after one trolled. He gets out of bed, but is easily got back again; he is subdued with very little difficulty. This is not the case in delirium arising from inflammation. These are only intended as practical remarks for your observance, and as we have not time to go more deeply into the subject, I shall go at once to the treatment.

Treatment. - Now supposing you were called to a patient who was labouring under the carly stage of delirium tremens, where there was no question whatever as to the nature of the disease. Your first object in such a case would be to ascertain that the bowels were sufficiently open; and to ensure will be that you would give him, probably, a warm

stimulating purgative, with, most probably, the degree of irritability in each particular a small dose of calomel,—say three, four, or case, and also to the power of the inde idual, five grains, with two or three drachms of In slight cases, small and frequently rematter of course, as I have before observed, the secretions cannot be otherwise than deranged; in the existing state of the brain and nervous system, you could not expect that the accretions, under the strongly recommended the employment of mercary. Now I am of opinion, and that until sleep was procured. If you find, after from practical observation, that it is exceedingly proper to give occasional doses of that the excitement still goes on,-that there mercury, perhaps every other day, or, it is still a want of sleep, and the same degree may be, once in three days, for the purpose of irritability and illusion, and perhaps of producing the effect of what, in older without the pulse being augmented (withtimes, was called an "alterative;" I think it is right to give "alterative" doses of mercury, just sufficient, perhaps, to change, not think you would do any good, -on the diminished, then I should not hesitate to contrary I am quite satisfied that you would do harm, by giving mercury, in true delirium tremens, in such quantities as should produce the specific effects of that medicine on is, that mercury, generally speaking, sets up, along with its specific action, irritation in the system. You have already excessive irritability of the brain and nervous system, therefore I would not give mercury in sufficient quantities to produce its specific effects, because I think its administration would be likely to increase the very irritability which I wished to subdue.

What, then, after all, is the indication in delirium tremens? Why, it is to allay the peculiar irritability of the brain and nervous system; to induce sleep, and afterwards to restore the secretions to their healthy character. Allay the irritability of the brain and nervous system, procure good sound sleep, and increase the patient's strength by giving moderate tonics, aided, perhaps, by stimulants, and the secretions will, in all likelihood, return to their healthy condition, without the necessity of employing the specific influence of mercury.

What, then, are the means by which we sleep? You all know, gentlemen, that in find that your patient awakes amazingly irritation of the system generally, or in irri- lieved; in some instances perfectly, tation of any particular part, no means with the caution I has which we are acquainted are so powerful in haps, be best illust allaying that irritation as opium. Then opium becomes, I may say, our sheet-anchor during th in the treatment of delirium tremens, and to see. that must be given in doses proportioned to intelligent

were not readily acted upon, you would give him some of the neutral salts with phis, the acetate or guriate, will be sufficient; it. But I am quite sure you will find that say from ten to fifteen or twenty minims in very active purging will do no good. As a slight cases, repeated every three or every four hours, until sleep is procured. But if the irritability is great, you must then . hve recourse to larger doses; in which I should say that it would be useless to commence with a dose of less than forty or fifty or even circumstances, would be natural; and, sixty minims, and I should prefer the latter, on this account, some who have written if of the tineture of opium; or from three to on the disease, being aware of this de- five grains of pure opium, or from a quarter praved condition of the secretions, have to half a grain of the muriate or the acetate of morphia, to be repeated every four hours the patient has taken three or four doses, out there being the slightest proof of inflammatory action in the brain itself, or in the membranes of the brain), and that the in some degree, the secretions. But II do delirium seems to be increased instead of give an increased dose. For example, if I had been giving half a grain of the muriate or the acetate of morphia every four hours, and after the third dose found the irritability the constitution. Now my reason for this not allayed, having waited the proper time after the exhibition of the last dose, I should then give one dose of a grain. Observe that I say, after having waited the proper time. Now my reason for saying this, for advising you always rather to commence with a small dose at first, and to wait the effects of thatto feel your way, as it were, than to commence with the boldest dose at once, is this. that though in a great many instances you will find success attend the exhibition of the larger dose, yet it has occurred to me in two instances, and it has also been related to me by one of the best practical physicians of the present day in this town, as having occurred to him also in one or two instances, that by commencing with a dose, say of a grain of the muriate or the accrate of morphia, such an impression has been made on the brain and nervous system, that the patient has never been aroused from it; knowing, therefore, that such an effect may take place, it becomes our duty to exhibit opinm with caution. When sleep has been procured,would endeavour to allay this irritability of and when it is procured it very generally the brain and nervous system, and procure runs on for six, seven, or eight hours, - you

The caution I have ju you the folio he ind practitioners

a lady who had been ill for some time; and it was necessary, as a matter of course, though painful to her friends, to acquaint me with the cause which had brought her into the condition in which we saw her. She had unfortunately contracted a habit of drinking brandy. Now I found her suffering under true delirium tremens. There was the tremour, the quick pulse, and, being in an advanced stage, the tremour of the whole body, the tremour of the tongue, the profuse perspiration, the absence of pain and heat of the head, and there was the creamy moist tongue. The only symptom wanting to make up the disease appeared to me to be the illusion, which I could not detect; still I was satisfied that the disease was delirium tremens, and I was very nearly quitting the bed side, with the impression that it was a peculiar case of delirium tremens, unaccompanied by illusion; but just as I was about to go, I said-" and so you have not slept any night for some time past; you did not sleep at all last night I suppose?" She replied, " How could I sleep? We had workmen in the house." This was the fact, for there were workmen about the house; but she went on to say, that one of them had attempted to get into her room at night, a and that he was constantly at the door.
"He packed up all the plate," she said, " and took it away with him. He has since been apprehended, and my husband is now at Bow Street, attending his examination." Now this was all told so deliberately, and appeared to me to be so natural a chain of events, that I thought it must be true, and turning to a female relative or friend who was standing at the foot of the bed, I said-" Is that really so?" The answer showed that there was not a word of truth in the statement, except what related to the fact of the workmen being about the house. The existence of illusion was now manifest enough, and I directed half a grain of muriate of morphia to be given every four hours, and that if, after the third dose had been exhibited, the irritability of the system was not allayed, a dose of a grain should, after waiting the proper time, be given. Two doses were given, but still the irritability remained, and in about an hour afterwards a dose of a grain was given, the united effects of which three doses were such, that the medical man was obliged to be fetched, when he was under the necessity of pouring down brandy and ammonia, and using constant friction to seep the patient in a state of agitation for a

derable time, in order to counteract

of the narcotic, from

the patient did per-

d man had

ce is that

In addition to optum, cold applied to the head is another most useful remedy, either in the form of evaporating lotion, or applied in the shape of ice.

I have already stated to you my objections to mercury. I do not think that in this stage of the disease, or in this particular species of the disease, blisters are of much service, unless you imagine there is some slight degree of congestion, or of inflammatory action going on, which you are afraid to attack by depletory measures; then perhaps a blister may be used, but otherwise I should not have recourse to it.

Well, now, during this period, in conjunction with the opium, the powers may be so enfeebled and exhausted, that the exhibition of some stimulants may be proper. Now, of those, the Materia Medica presents a great variety; and you will find suggestions to give camphor, ether, ammonia, asafeetida, valerian, and a host of others; but I don't mind making the avowal to medical men, that in a case of this kind, as regards stimulants, and especially those which come under the denomination of " antispasmodics," I have but a very sorry opinion of them. I know what a moderate quantity of wine is capable of producing; I also know what may be gained by light nutritious diet, but I confess to you that I am not quite satisfied as to the quantum of stimulating effect that may be produced by five, six, or eight grains of carbonate of ammonia repeated every six, or every four, or every three hours. Or, if the quantum of stimulus be ascertained, still I am afraid you will give it at the risk of nauscating the patient's stomach, and preventing him or her from taking that which, in the way of nutriment, you ought at the same time to administer. However, there can be no objection, though I dare say there are many who think differently from me, for those who see their way more clearly with these remedies than I do, to giving moderate quantities of carbonate of ammonia, of camphor of other, or, if you think that it is a good stimulant, of asafeetida. I confess for myself, that I should be much more inclined, if I wanted a mere stimulant, to give some good porter, or some tolerably good ale, taking that stimulus more especially to which the patient had been previously in the habit of resorting, only giving it cautiously, and watching its effect.

The food ought, as a matter of course, as I said before, to be light and nutritions,—say milk, good strong beef tea, animal broths, and, in some instances, where the patient's stomach will bear it, I should have no objection to allow him a mutton chop, or a slice of meat, always being careful so to graduate the exhibition of stimulants, anot to produce over-excitement; if you do that, then you will get the second species of delirion tremens; you will then have

-

inflammation of the orain in addition to irri-

Supposing, then, that the opium has procured sleep, after having been obliged to resort to a larger dose. I would still continue the exhibition of the opium in small quantities-that is, if I had been giving it in the form of the muriate or acetate of morphia in doses of half a grain every four hours, then having afterwards resorted to one grain, in consequence of the previous small dose not having been sufficient to procure sleep, that one grain having had the desired effect,-then, after the patient had awoke, I should continue the small dose for a certain time every four hours, the object being, as soon as the irritability of the patient was sufficiently diminished, to diminish, also, the frequency of the dose of opium. This, however, must depend upon practical observation. It is quite impossible to lay down any positive rule as to when the quantity or the frequency of opium ought to be diminished. That must depend upon the degree of irritability remaining.

Next, as regards restraint. Now, if that can by possibility be avoided, it ought not to be employed. As I before observed to you, the delirium is, generally, of that peculiarly passive character which does not require forcible restraint, and where it can be avoided it ought, because it only produces increased irritation. One or two people, generally, ought to sit at the hed-side. It is quite sufficient to persuade the patient, merely leading him back to bed, instead of confining him with a strait-jacket, as the patient was obliged to be confined who was labouring under the second species of delirium tremens, and whose case I brought

before you last week.

Supposing the irritability of the brain and nervous system to have been subdued by these means, it may then become necessary to resort to some mild tonic, and perhaps some of the vegetable bitters, some quinting perhaps may be best adapted for restoring general strength to the system. It becomes also a positive daty, an unpleasant one in many instances, more especially in private practice, to represent most strongly to the patient the risk he runs by again indulging in the vicious habits which brought on this disease, for in ninety-nine cases out of a hundred, it does arise from the abuse either of spirits or of opinm.

Second Species of Delirium Tremens.—
(Case of Grey.)—Well, then, with respect to
the treatment of the second species,—that
species under which Grey was labouring.
Now in such a case the treatment must, to
a certain extent, be of an opposite character,
and, to a certain extent, ultimately, of a
combined character. He had been twice
bled before he came in. He was bled, properly bled, by Mr. Stonz, when he came in.
of the deli-

saw him that he was suffering under deliriun tremens, yet I was equally satisfied that h was labouring under delirium tremens accompanied by inflammation of the brain or its membranes, or both; for I do no hesitate again to confess my inabilit positively to say when the brain alone is in flamed without there being any inflamma tion of the membranes of the brain o when the membranes of the brain are alon inflamed without there being any actual in flammation of a portion of the brain itsel: It looks very well on paper to make thos distinctions, but you will find it difficul enough to make them when you come tpractise. Satisfied, then, that this inflam ination existed, and that a sufficient o nearly a sufficient quantity of blood has been taken, and that it would not be pruden to risk general depletion further, I did no hesitate at that time (continuing cold to th head) to direct further local depletion b taking eight ounces of blood from the occi put, and at once giving him after that (i. conjunction with the mercury, - Mr. STON having ordered him three grains of calonic every six hours, and which I then directe every four hours) half a grain of the muriat of morphia, every four hours. You say the result of this. After the second dose of the muriate of morphia, his delirium di minished, and he obtained three hour and a half of sleep. When I saw him th next day, there appeared to be still sufficient proof of excitement about the brain or it membranes to warrant a further abstrac tion of blood, although I continued the mu riate of morphia, and eight onnees more therefore, were taken from the occious After this no further depletion, either gene ral or local, was necessary. He went on fo two or three days progressively amending and now I come to an error in my ow: practice. Finding so much amendment. was willing to diminish the frequency of th exhibition of the muriate of morphia, and a he answered perfectly rationally, as ther was no proof then of any inflammatory ac tion about his head, as the tremour wa lessened, and, in point of fact, as he wa in every respect better, I said, " Give th muriate of morphia every eight hours in stead of every four." Well, now, what wa the consequence? Why, that within four and-twenty hours after that, his deliriun increased; he became almost unmanage able. Mr. STONE was called to him, and very properly gave him a grain of the mu riate of morphia, which quieted him, he went to sleep. This incdicine was resurged in doses of half i hours, and continued of time wholly Now you I

much by had practice as by good. I can-didly admit, that I ought there to have con-binued the muriate of morphia a day or two tient has been suffering under such a disionger, as frequently as it was given before. ease as that upon which I am now making You will observe, too, that here was another my observations. or asalectida, but to a small quantity of rium tremens, namely, that which is accomporter, which he bore very well, that is, his panied by inflammatory action; and that brain and hervons system bore it well, but it as, very frequently, the stomach in delirium was not agreeable to his taste, therefore in tremens is so irritable as to make it an obtace ourse of a day or twoit was changed to ject with us to tranquillize that organ very a small quantity of wine; the wine also he speedily, I certainly cannot imagine anti-did not like, and that was changed, ultimony to be useful in the true delirium tremately, to a small quantity of brandy, a mens. I should hesitate very much before tablespoonful twice in the course of the I employed it in the second form of the four-and-twenty hours, properly diluted disease. with sago, arrow-root, or grael.

that in the treatment of the true disease, tain whether it has been employed in this 1 myself did not believe it to be neces- country; but it has been said to have been sary, or that it would be advantageous, used, and in doses which excite at least my sary, or that it would be advantageous, used, and in doses which excite at least my to give mercury so as to produce its spessive,—in doses of a drachm,—of sixty cific effects upon the system, and I gave minims every two, three, or four hours, fremy reason for so thinking; but still merquently repeated. I only mention that cury was given here. But then, here were such facts have been brought before the two diseases; there was inflammation of the public. They may be true, but I am quite brain supervening on delirium tremens, and satisfied that I never should have felt warthe mercury was given on the principle of ranted in employing such a remedy in most its being one of the best adjuncts which can of the cases of delirium tremens which it be cuployed in conjunction with depletion, general or local, in diminishing inflammatory action in any of the tissues of the body, excepting the mucous membrane of the with respect to delirium tremens, so as to bowels; that is, in my opinion; but here it discriminate the true delirium tremens; was given—and I think it is probable that and it has just occurred to me that I did I should have given it myself—twenty-four not allude to one circumstance which should hours before I saw the patient. I say I have been mentioned. If perchance you think I should have given it myself. Still mistake true delirium tremens, in a very you are to remember what it eventually did. shattered constitution, for inflammation of It set up excessive irritation in the nuccous the brain, and treat it as inflammation of membrane of the bowels, so that we had a the brain, I stated that you will most proharassing diarrhea, which we were obliged bably lose your patient. Now, I saw an to combat with astringents and doses of instance of that some fifteen or sixteen opium, even after the irritability of the brain years ago. The case was one of a butcher, and nervous system had so far subsided as who had drunk exceedingly hard, and there to render the further exhibition of morphia was a consultation of three medical men unnecessary. Nay more, the mercury went on to produce something beyond irritation; so I presume, from the nature of the dis-be supposed to have now, but still it ap-charges from the bowels. Certainly there peared to me to be decidedly a case of deli-

delirium

an effect of

modification of the treatment, because with It has been suggested by some practi-the exhibition of the optim, which is not pro-tioners that antimony might be of service per, if you have merely inflammation of the in delirium tremons, given in large doses. brai or inflammation of the membranes, it Upon that I have no right to offer any obwas necessary, and speedily too to give him servation, because I have never seen the some good beef tea, and in addition to the practice earried into effect; but I may take beef tea it was necessary to give him some the liberty of stating what my idea is on the stimulant. I confess that I did not here subject. I think that if useful at all, it can have recourse to musk, camphor, ammonia, only be useful in the second species of deli-or asafectida, but to a small quantity of rium tremens, namely, that which is accom-

MA SHARLES BELL ON MESSAGE EDUCATION, AND

and twolve ounces of blood were directed to be taken from the occiput. Immediately upon removing the glasses the marriel into convulsions and died. Now I do not bridge that that result would have happened if this depletory measure had not been adopted. It might. It is impossible to say that it might not. He had not previously suffered convulsions; but I do think that the fatal termination would not have happened had the blood not been abstracted.

I am anxious, gentlemen, to recal your attention, to prevent misapprchension, to one part of the case of this man Grey. I mentioned to you that the medical gentleman who had seen him before he came into the hospital had very properly directed his feet to be put into warm water, and I added that they had indeed been put into warm water.-that they had been put into boiling water; and I am anxious just to recal the fact to your minds for the purpose of now saying that this immersion was not the act of the medical gentleman who saw him, but an error of the friends of the patient, or the people about him. The medical gentleman had no kind of intention of putting his feet into boiling water. It was the error of others, not of him.

I was about to call your attention to two cases of gastric affection that have occurred in the hospital,—one a well-marked case of ohronic gastricis, and treated as such; the other of gastric irritation—one, at least, which I myself believe was not at all of an inflammatory character, though it was thought right in, some measure, at first to treat it as though it were; but as it only wants five minutes of the hour, it would be absurd now to enter into a consideration of swo cases which are of considerable interest, and therefore they will occupy our time at our next meeting.

*** In the lecture by Dr. Roots, published on the Shi alt, the suggestion of the term "delirium cam tremore" was, through misapprehension, ascribed to Dr. Copland, in whose "Dictionary of Practical Medicine" the term is, we believe, applied to the disease commonly called "delirium tremens." The same, however, was first employed by Dr. Elliston in the following passage, which we extract from a lectare delivered by that gentleman in 1831:—"The disease to which I allude is called delirium trancus, which is rather as improper word, because the delirium cannot tremble. It would be better to say delirium cannot tremble. It would be better to say delirium cannot tremble. It would be better to say delirium cannot tremble.

MIDDLESEX HOSPITAL.

LINICAL LECTU

ON CASES OF

DISEASE OF THE SPINE,

SIR CHARLES BELL

On Tuesday, November 3rd, 1835.

I EXCERDINGLY regret, gentlemen, that you are occupied so constantly, - from morning to noon, and from " noon to dewy eve, -attending lecture after lecture on medical subjects. It is hardly possible, under these circumstances, to be a usefully diligent student, for you are apt, amidst the perplexities, to forget the great object for which you have come to London, which is to pursue the study of anatomy and surgery,two points that will ever be well taught in London alone. A gentleman once rose in the House of Commons, and declaimed with great emotion about the danger to which his Majesty's liege subjects were liable, of being poisoned in consequence of the ignorance of boys in apothecaries' shops; when another member rose and said, that they managed those things better in Germany And so a certain class of members of Parliament take up the matter, the Government being always glad to see the House of Com-mous occupied on a subject in which they incur no personal responsibility. The present principles of medical education have gone on developing themselves, until all the birds of the air have given to the Apothe caries of London, the power of deciding what lectures students shall attend, and the studies they shall pursue, and the result is that a system prevails under which no in dividual can do much; for it is requisite in order to accomplish the curriculum, tha the lectures which you attend should be se multiplied as to keep you on the move, with hardly an interval of time between them from one theatre or one lecturer to another until one is put in mind of Matthews's ac count of the sweepstakes, where the horse are all neck and neck together, and al come to the goal at once.

Well, now you must consider it my duty if I am so unfortunate as to be against Companies of Apothecaries, Colleges of Physicians, Councils of Surgeons, and Parliament to hoot, to remind you, that your in London is to study

learn thoroughly anatomy, with pathology

resent to address yo

liar advantage. I formerly gave my time book to read an account of the cases. tures, because when I looked around, I three or four different schools, with no ideas common to us all, with no principles such as I could conceive to be correct, and, therefore, with no combility on my part of being usefully employed in commenting on the progress of cases. Now, however, the case is different, of which I will give an example. Supposing that you were to go into Clayton's ward, where there is a man lying with a wandering mind and a bewildered stare, a very pale face, and a deepcoloured extravasation around the eyes, and grumous blood issuing from the ears. man has fallen on the top of his head, and were I to enter upon the case in the hearing of those who were uninitiated in the doctrines delivered here, I should be obliged to the principles of the entire machinery on which the skull is built. But now, in half a sentence, I can say,-There is an example of the case of which I speak. There is a man with a blow received upon the upper part of the parietal bone, the effect of which is visible on the temporal bone, and in the ear. Or here, again, is a man lying with a fissure in the base of the skull. Would it not be necessary, in lecturing upon such a case, that I should go into the whole anatomical relations of the fissure. I should merely need to say, that here is an illustration of such and such facts, or principles, as I had endeavoured on a former occasion to inculcate. The same thing would avail me in a case of fracture of the humerus near its head, for instance, of which we have an example. On such an occasion I need hardly speak of the necessity of particular appliances in the treatment, such as saying, that if the lower part of the bone be not properly disposed, such and such effects will be produced by the pectoralis major and other muscles. One word will now be sufficient for those who are properly initiated, as I shall take hem to be, in anatomical demonstration.

After this preface I shall beg your attention to some diseases of the spine, principally taking up that which is termed " lateral curvature." There is, amongst others in the hospital, a case of extreme curvature, with scrofulous caries of the bodies of the vertelese; there is also a case of inflammation and scrofulous disease going on in the upper vertebræ of the spine; there is a case of irritation and spasmodic affection Merno-cleido-mastoideus; there is a ment rigidity of the sternod a case of distortion star series of study by ration for

take advantage

unwillingly to the delivery of clinical lec- first is that of Elizabeth Millross, who was admitted so far back as April the 23rd, an found that the pupils before me belonged to indolent girl, who, like many other indolent girls, is the subject of curvature of the spine. The distortion became evident from the circumstance,-remarked by her parents,-of an awkwardness in her gait, and they now conceive that the right shoulder is "out," and so, indeed, when you take off her clothes, and expose the back, you find that the right shoulder is very prominent, that the scapula is elevated,—that there is great protuberance of the ribs and scapula. The "shoulder" in this case is not at all to blame, - but there is expansion of the ribs on the left side, in consequence of a curvature in the spine, below there is another curvature, forming the spine into the shape of an italic S, the cause of which is to be found in the following manner: - An describe the whole structure of the head, and indolent and weak girl, with a constitution disordered by the first attacks of uterine irritation, experiences a pain in the back, and suffers great weakness and languor. To relieve herself from the pain and debility, she "hangs," as they express it in the North, "upon the strong foot,"—that is, the right one, and eases the left one, the result of which is, the twisting of the spine to the right side, and the tendency to curve the whole body in a corresponding direction, but as this cannot take place, it begins to poise itself, producing a second curve in the spine, which second curve throws out the ribs. Here is an instance in a poor girl who died in this hospital from disease produced under these circumstances. The spine is seen to be first inclined to the left side, and then to the right, forming a curve the convexity of which is towards the right side, and the concavity towards the left. Thus the left ribs are drawn together, and, while the whole mass of the thorax is diminished, the right shoulder is thrown out. You thus perceive also how there comes to be an inequality in the shape and position of the pelvis,-the cause there is for the mother or the instructress to observe deformity in that part. All this is the mere result of a defective constitution,-of a constitution irritated by the first changes in the uterus, thus operating, chiefly, in consequence of habits of indolence, -from the want of that activity which I need hardly remark is essential to the strength and perfection of structure. You have an excellent opportunity of observing the truth of this in bones while they are recent. The spine consists not only of bone, but of cartilage and ligaments, with muscles going from point to point. Now the bones do not grow by themselves, nor do cartilage, ligaments, and muscles, but they all belong to one constitution, and fail or become perfect together. Therefore it is quite wrong to talk of an affection of the spine being peculiar to e dresser's the yertebral bones, or to the muscles, or

the ligaments. The whole substance of the [We know that the bones, the ligament, and spine in such cases is debilitated, that action which is the great stimulus to its perfection having been wanting during the period of its growth. Hence the basis of health in these parts is activity, and that activity should be directed so as to counteract any tendency to curve in the spine. It must, however, be recollected, that you cannut bend the spine as you would a twig. You must persevere gradually in your attempts to make it grow in a right direction.

The next case to which I shall call your attention is that of Ann Hutchins, atat. 20, who was admitted on the 9th of September, stating, that about a year and a half ago she was affected with pain and weakness in the loins, after which she lost the entire use of her lower extremities, and soon after was admitted into the Salisbury Infirmary, where tion of the spine, not exactly resembling the she continued for six weeks, during which period various remedies were administered for her relief, issues amongst other means being applied on each side of the affected of the vertebra. Pray let this specimen part of the back, but without producing my make a due impression on your minds. advantage. At present there is very little pain, and she is comparatively easy when in the recumbent posture, but when made to sit up, she complains of a sense of weight and weakness in the back. Her lower extremitics have lost all power of voluntary motion, but sensation is not entirely gone. At one time she had great difficulty in passing her urine, but now that symptom is much relieved. On examining the spine there is a projection backwards of some of the last dorsal vertebra. The catamenia appeared when she was first affected, and have not occurred since. Her general appearance (says the report; is that of a person in good health. When the extremities are moved, it is apparently without her knowledge. There is no relaxation in the abdoshe can tell when her feet are cold, or when cold is applied to the extremities.

Here you have the brief relation of a case of scrofulous caries of the vertebrae, with acute curve of the vertebral column. The first point to arrest your attention in this case is, the formidable contrast which is afforded in it at least to the constitutional weakness, or predisposition to the disease, which existed in the other patient. The disease here is not actually formed in what may be called a vital part. The bones of the vertebræ, especially, are of a spongy and light texture, and are proportionably liable to become the subjects of scrofulous inflammation. There is some little debate among pathologists whether the disease of the spine in these cases commences in the But what more do you ligaments, in the inter-vertebral substance, raise the surface -or in the bodies of the vertebra. On dis- from the surface section we find that all are affected, and it are already is a vain speculation to endeavour to determine which of the parts is primarily affected, whole of the

the cartilage, are the parts of the body most liable to scrofulous action, and in this part they are more intricately combined than elsewhere. It is stated in the history of the case that she had experienced a wrench in the back, or, at any rate, that she had been in the habit of raising heavy weights. Now it is very possible that this may have han the origin of the disease, though I do not quite agree with my friend the dresser, that the patient appears healthy. On the contrary. I should say that a distinctly scrofalous diathesis is marked in her appearance. However, this girl may, by raising weights, thus have given origin to the disease.

Here now is an illustration of the advantage of a (concentrated) school. I am able to produce you a specimen of lateral distorlast case, but presenting an acute projec-tion, directly backwards, formed by the wasting, ulceration, and absorption, of some When these facts are placed before you, I need hardly point out what is the great doctrine for practice which the opportunity of observing them points out. But to return to the case. I stated that there was pain in the loins, and this is a remarkable circumstance; yet it is one which I observe in all these cases, and the reason of it is apparent. The power of motion is entirely gone in the lower extremities, but sensation is only partially affected in them. Sometimes, however, it is entirely absent. On referring to the spinal marrow, you will find that the nerves of motion are so directed, in issuing out from the chord towards the bodies of the vertebra - that should inflammation take place in the bodies of the vertebrae, it must affect the motor nerves at an earlier minal muscles, no bagging of the belly, and period, and to a greater extent, than those o sensation. We observe the fact, and this is the explanation that I give of its occurrence The circumstance leads to another question There are persons in London who profess to cure diseases of the spine, and who ridicule the regular surgeon for not attempting and effecting the cure of scrofulous caries of the vertebræ. These spine doctors " care " the disease by raising the body and stretching the spine. Now does this suggestion offer or not a very important remedy to our no tice? Ought you to adopt the same plan in similar cases? It is true that you may lead the patient to believe that you can use fully extend the length of the patient some inches, and having done so, you m port the body at that length b

ammation

nents, and allow

separation of the vertebræ, and there is | that centre, it is your business to keep the actual caries destroying one after another patient in the horizontal posture, and to of the vertebre. Then of what use is extension of the body? I know that it is quite jection of the spine, that the latter can sink possible to stretch these persons, to raise into the former without injury. The pathem up; but what can you expect to follow that raising? There is a large gap, a vast hiatus, between the upper and the lower pales of the diseased hones, so that anchylosis cannot possibly take place between them, although it is to that very process is asserted by some persons does no good, that you must look for the union of the vertebrae, and the mending of the diseased spine. Unless then the parts be kept perfeetly at rest, and in apposition, how is it possible that we can expect a core, knowing for a certainty that a cure never did feets in the constitution of the patient, and take place in any of these cases, except endeavouring to rally its powers to get rid through the process of anchylosis? Besides the prevention of this cure, there is also the danger,-though this may be only a speculative suggestion, -of a falling down again after it is raised, and support is removed. I look with horror on the conscquences of such a fall after the bones have been thus upraised by mechanical means tending to separate them. The effect of a sudden fall would be not only a new curvature, but an injury of the spinal marrow itself. What then does this quachery mean? It must be productive of great harm if the disease have not proceeded to anchylosis, though it may do some good when anchylosis has taken place, by twisting and moulding the upper and lower parts of the body, so as to accommodate them to the fixed position of the anchylosed portion of the colump. That is all which there quacks can But suppose a person to labour under this disease, the inflammation to have subsided, the anchylosis to take place, the whole mass, by the solidification of anchylosis, to be strengthened, and the quack then to begin his forcible process of stretching, hoping to do no harm by it, but endeavouring only to cause the upper and lower parts to accommodate themselves to this permanent curvature; even then it should be remarked that he goes to work with the danger of breaking up the longceive that the preliminary cure requires a of disease in which I am sure I do not exaggerate, when I say that motion alone is seeping up the disease of the patient. It is he joints, it is so in ulcers, which nch trouble, and it is so in cessant soul motion of the pa

tient must be so guarded, that if she moves at all, there should be no motion in the inflamed parts.

The next point for consideration is the treatment by counter-irritation, which it though I am unwilling to admit the correctness of that denial. Counter-irritation by issues may be beneficial, but the greatest portion of benefit is to be derived by attending to the origin of the disease, the de-

of the cause.

Before I quit this subject, I must make one further remark, because I have seen it stated in a book, that there are no diseases which present a greater variety of forms than affections of the spine. This seems to me to be a very extraordinary statement; but I know how it happens; it results from persons mistaking a sympathetic affection for the real disease. When there is actual caries of the vertebra, and an actual falling forward of the spine, the symptoms may vary in consequence of the inflammation reaching to the spinal marrow itself, or it may be attended with more or less pain, and there may be more or less paralysis. But people class together fifty different affections under the head of caries or disease of the spine. I do not, after all, however, so much wonder at this, for I can assure you that there is nothing more difficult than the diagnosis where the spine is affected. There is a languid girl, for instance, who, when she walks, has great pain in the loins, and a suspicion arises that some disease exists in the spine. You strip her, examine her, and feel down each process of the vertebræ; you come to a particular spot where there is acute pain, and you say, " Do not deceive yourself; are you sure that there is pain at this part?" She will repeat that she nositively feels pain in that particular established connection of the hones, or tear-ing asunder that union which is not yet bone but only ligament. Thus you per-pal source of derangement, in by far the greater number of such cases, is uterine irstate of perfect rest. On looking round the ritation. If you place her on her back, and hospital, you will see hundreds of instances confine her to that posture for months, you ruin the constitution. You are just doing that which excludes all hope of amendment, for amendment depends on exercise and freedom of air,-on the restoration of contole, and it is so in stitutional strength, and the return of the So long as a person uterine functions. By following a course of there can be no practice not indicated by the disordered bout a correuterine action and the pain in the back, as and as there sympathetic of the original disease, you deritation kept vote the poor creature to a condition in diverging from which she lies without a chance of improvement. I have raised up at least twenty to disease. This case no doubt must appear young women out of this condition, when more formidable to you than the last. Inthey had been from eight to sixteen months fiammation in the spinal marrow is serious rest to be essential to the cure.

admitted on the 6th of October, on account i instantly follows as if an animal had been of a distortion of the upper vertebrae of the "pithed."

neck, which throws her head towards the left shoulder. There is a tumour, extending on perceiving such a mass of disease around from the occiput, of five fingers' hreadth, the upper part of this patient's spine. At down the spine. The third and fourth verithe same time, however, it is obvious that she had rheunatic fever, which continued swelling began. She has no weakness of the arms and fingers, and never had: there is occasionally a difficulty of swallowing, or, rather, she has had that difficulty, for it is now removed. She herself attributes the difficulty of swallowing to tension caused by the pressure of the tumour. There is an issue in the neck, and she has taken liquor potassæ, and aqua calcis. Her head is more upright now than when she came into the hospital.

The first reflection that I shall make on this case relates to the long-continued fever. On inquiring into these cases of affection of the spine, you find, for the most part, that it is such long-continued fevers and long confinement that produce this scrofnlous diathesis. A course of mercury will produce the same effect. In fact, whatever reduces the power of the constitution below par, will render the patient liable to scrofulous action, from a slight injury done to any of those parts, which, I repeat, are particularly liable

in the horizontal posture,—not labouring enough; but inflammation in the medulla under disease of the spine at all, but merely oblongata, or pressure upon it, must produce suffering from sympathetic pain there, arisinstant death. There have been in the hosing from other internal disorder. The ori-pital some melancholy cases of sudden death ginal cause is sometimes in the bowels; it resulting from fracture of the spine, and a may be in many other of the viscera; affections even of the lungs will produce it; affections of the heart will occasion pain in as you perceive them to be in this case, the spine. Pain in the mamme, or disorder for the ligaments must also partake of the in the colon, or disease of the uterus,—all disease, and therefore the bones are particularly liable to displacement. If a wrench of the production these are pregnant sources of error, pro-larly liable to displacement. If a wrench of the production the second of the production of the production of the line of the line of the liable to displacement. If a wrench of the production of the line of the ducing the very symptoms which may be the neck or a displacement of the vertebramistaken for carious disease of the bones of occurs, the medulla oblongata becomes the vertebræ. These are very different cases nipped, and instant death ensues. If presfrom those in which I have before described sure be made there,—that part of the nervous chord being the source of all the nerves of Another case in the hospital is that of respiration -not a word is afterwards spoken, Mary Blaymer, zetat. sixteen years, who was not a breath more is drawn, but death as

It somewhat resembles the and hardness of the tissue surrounding the disease called "pole-evil" in the horse, vertebra, and occupying all the upper and There are ligaments connecting the horse's back part of the neck. She cannot turn her head to the thigh and hursa, and when he head without pain, and the chief motion is reined up suddenly he is very liable to takes place at about the fifth cervical ver- injure the union of the head with the spine; tebra; that is, when she attempts to move but, luckily, this occurs not in internal but the head, she turns it on probably the fifth in external parts, and gives rise to a swellvertebra of the neck, all the upper part of ing, abscess, and suppuration. This is a the spine being consolidated. An example scrofulous disease in the pole of the horse, of this disease is now on the table, and here and I apprehend that the same kind of is also another specimen, proving what an scrofulous disease may be set up in the huextraordinary defect may exist in the upper man neck, by a sudden wrench, followed, pervertebræ. In the summer, says the report, haps, by anthylosis of the vertebræ. The discase happens, in such case, externally to the for four months, and on getting better this theca, which, you will remember, is very thick. You remember the ligamentum infundibuliformis, the powerful ligament, which, like a funnel, runs down from the dura-mater and occiput to the spinal marrow. It is that which affords protection in this case, and allows the girl to move her head about with a degree of fearlessness which would otherwise make me shudder

to see her move at all. As to the cure of the case, it must be conducted by paying attention to the constant fixing of the part, preventing all lateral motion, and inculcating upon the patient the necessity of avoiding all acts of violence. I hope that if this advice be attended to, time will solder the parts together, producing chylosis, and that the girl will as regards her life; but by this, lose all motion the imperfect sales ed at the level par tehrm. I make the marks preparate

I shall speak of these patients on another day, and then advert to some interesting cases of disease of the face.

ST. GEORGE'S HOSPITAL

CLINICAL LECTURE

ON CASES OF

DISEASE OF THE HEART, DISEASE OF THE LIVER, CONTINUED FEVER, AND PALSY,

DELIVERED BY

DR. SEYMOUR,

On Saturday, October 31, 1835.

I HAVE very little to say to you, gentlemen, this afternoon. The fact is that the greater number of cases which remain for me to notice are getting well, and I have spoken of almost all of them to you in the progress of recovery; however, I shall allude to them in their present state, and then I shall speak of those cases of palsy which are in the house, the only cases of any great interest at present here, the others being in a progressive state of convalescence.

OSSIFICATION OF VALVES OF THE HEART (?) - There is a man of the name of who, according to my idea, -but any body may be wrong,-according to my idea, is labouring under a degree of ossification of the valves of the left side of the heart, without increased size of the heart, and mattended with dropsy, but it is sufficiently diseased to prevent the proper return of the blood from the lungs to the heart; hence there is extravasation of fluid into the chest, and a very irregular pulse, partly dependent on the state of the valvular apparatus, and partly on the necessary irregularities of the action of the heart in forcing on the aid. He has been treated for inflammatory ich I am satisfied never existed. He had all the sympchest,-difficulty of

more on the circulation of the blood through the lungs, than on its circulation in the other parts of the body. The blood was freely brought to the right side of the heart, but impeded in its progress to the 'left side of the heart. I put him on low diet, and gave the infusion of digitalis, with the oxymuriate of mercury, and the tincture of cantharides. He has made, ever since, a large quantity of water-two quarts, or more, in the course of the four-and-twenty hours. The consequence is that the startings in his sleep have been diminished-are gone, in fact; he sleeps quietly; the pulse is losing a great portion of its irregularity, is becoming full, is 84 in a minute, and the man expresses himself as being well. The prognosis in this case is dangerous. If the cause remain which produced the effusion into the chest, the patient will probably die suddenly.

ENLARGEMENT OF THE HEART, DILA-TATION OF ITS CAVITIES, ADDRESSON OF THE PERICARDIUM (?) FOLLOWING RHEE-MATISM, WITH RENAL DISPASE.-Going, then, from that ward into Cambridge ward, there is a man of the name of Foster, who labours under dropsy-enlargement of the heart, with apparent dilatation of its cavities, and adhesion of the pericardium. He had been subject to rhoumatic inflammation, which has produced the pathological condition of the heart-the uniform condition which accompanies this disease in general the pericardium adhering to the heart. Two years clapsed from the rheumatic attack, without his suffering any inconvenience. The heart then began to dilate, and at present it is quite clear that it is so much dilated, that the valvular apparatus of the heart on the left side does not meet and fully close the cavity; hence the blood is forced out somewhat irregularly, - in gushes, Shepherd, of whom I spoke to you last, and as it were, and in larger streams. The pulse is larger, in this particular case, on this side of the heart than it usually is, because the valves are not closed; at least that is my explanation of it; there may be a more scientific one, but that is my explanation, and I am only here to teach you my own views.

The remedies employed in this case had the effect of getting rid entirely of the water. He was treated with calonicl and opium in the first instance, with a view to diminish any inflammatory action that might be going on in the pericardium. He had some return of rheumatic inflammation, and he was bled. His mouth became a little sore, and I ordered him to take the nitre draught, two or three times a day, with ten drops of irregularity of lanness of the tincture of squills, and a grain of opium are not in the circumstantity, and he was then ordered to read in quantity, and he was then ordered to read in the squills, in ointment, which is the plan

has appeared to me, in more cases than one, lunar valves. to be effectual. On the 26th he voided five quarts of urine in two days. On the sore from the mercury, which had the effect 27th the anasarcous appearance had disappeared. To day there is doubt whether heart heats with less violence. To day I there is any fluid remaining at all. The ordered him a slight dinretic, combined with heart is permanently diseased, and, con- a little tonic medicine. sequently the prognosis is unfavourable. It does, however, occasionally, happen, that after having got rid of the fluid, and having all events these are chronic cases, and adthe urine coagulates very strongly-another unfavourable prognosis. He is not able to retain his water for any length of time.

some respects, of what we saw hefore,both, however, labouring under disease affecting the valves of the heart,-the one with an increased, and the other with a is small, the converse of that in which a large quantity of blood is sent out from the The same thing, as to the small stream of blood to the vessels, takes place, where any obstacle to the circulation arises, health is much improved. as in ancuryam of the great vessels; more particularly where it appears to be anenrysm at the bifurcation of the aurta. In all those cases the disturbance in the chest is very great. I have often quoted to you, you will recollect, the case of a little boy who died here of rheumatic pericarditis, with an enormously enlarged heart. He had been four or five years the subject of the disease. He had various paroxysms before his death, and you could hear his heart beat as you went up stairs; but the pulse in that boy was always remarkably small. His heart occupied more tinued fever, which is always than a third of the chest, and yet the pulse was so weak that it could not, or could a scarcely, he felt. When he died, that was easily explained. The aorta had not grown from his infancy, and the heart had enlarged ten times beyond its natural size. The same of the face was very hot,

I am now adopting in some cases, and which effect occurs here from disease of the remi-

However, this man's mouth became very

DISEASE OF THE LIVER (WITH ABSCESS?) -There is the case of a person of the name reduced, in some degree, the inflammatory of Mills, in York Ward, which has excited action, the patient does well, and goes on considerable interest. He had laboured without feeling much inconvenience. At under inflammation of the liver, and was attacked with pain just where the lungs mitting of great relief. This patient like- and diaphragm meet; he had a short dry wise labours under disease of the kidneys; congh, with occasional shiverings and sweats; and I was induced to look upon it as inflammation of the liver, with suppuration. Since coming into the house he has lost the pain in his side entirely; he gets better sleep, and, by giving him small doses of HYPERTROPHY OF THE HEART ?) - Apa- magnesia, and sulphate of magnesia, his tient of the name of Ingram also labours stomach and bowels have been restored under disease of the heart, but in a different to a healthy state, and his tongue looks way. He does not appear to have suffered a great deal better, but he still labours from rheumatism, and his case is called, acquired a severe cough. To-day he has spit cording to the language of the day-1 will up a little puriform matter. Of course if not say the jargon of the day, from fear of there has been inflammation of the lower giving offence to any body,—but according portion of the lung, in consequence of to the language of the day, "hypertrophy of inflammation in the neighbourhood, there the heart." The heart appears to be enlung larged, and the walls are greater in proportions the substance of the lung, which would not tion than its cavities; and it is in this way get well without his spitting up a considerthat secretion is produced and dropsy takes able quantity of mucus; but I still look place. This patient's case is the reverse, in upon the disease of the lung as altogether secondary; however, as the pulse was quick and rather sharp, I have ordered some blood to be taken, that we may see how far inflammatory action is or is not going on in diminished flow of blood through them; this part, and, if necessary, to continue the and, consequently, in the one the pulse bleeding, watching him. If there be disease of the liver with abscess, as I have supposed, it is of the posterior part of the liver, where you cannot get at it by pumture: but, on the whole, the man's general

> COMMON CONTINUED FEVER, WITH UL-CERATION OF THE SMALL INTESTINES .-Among the female patients there is scarcely any that I shall have occasion to speak of. There is a little girl on the left-hand side in Queen's Ward, whose case is of great interest, because it affords an instance of disease which at present exists to some extent,which, indeed, is almost always falling umler the care of the practitioner, and which has proceeded very well under the ordinary treatment. It is a case of commen this country, and which

Always

The abdomen was other was very cold. tender to the touch. The stools were very much like water in which cabbage had been boiled, leaving a deposit at the bottom of the vessel of a glistening appearance, something like metallic antimony. This was attended with very great inflammation of the bowels. The practice was to give her five grains of Dover's powder, and five grains of ydrarg, cum creta, three times a day, and enough of beef tea to support her strength. Dr. Horg saw her and recommended a blister to the abdomen, which is very good treatment, and castor oil every other marning. Under this very simple treatment, the efficacy of which I can speak to in dozens of cases, the patient is entirely convalescent. But there is always fear of relapse in these cases.

Let us see what is the pathological state of the case. The glandular structure of the intestines, which is always pouring out fluid, partly to shield the bowels from obnoxious matter, and partly consisting of matter which is to be thrown out in the stools, is very extensively diseased. Of course, where it is very largely diseased, there is a constant thin and sanious discharge from the ulcerations. I am talking no romance to you. I have seen those cases of alceration of the bowels over and over

again.

Well, what is the method of care? Of course you can do nothing in a hurry. You must induce a healthy action of the excoriated surface, and that is done by exhibiting alterative medicine, of a soothing and oily property, which helps to move the bowels at the same time. This is the modus operandi of the medicine, and the philosophy of the treatment. We owe a great deal of our knowledge upon this subject to the pertinacity of the French. They certainly overdid the subject, but we improved upon their treatment, and there is much credit due to them.

As the disease advances, however, this may happen. The alcerations may be more extensive in one part than in another. They may now and then become very deep, and I have seen suddenly ulcerate through. more cases than one of that sort. There was a patient up-stairs, in whom symptoms of this sort came on. Violent sickness occurred on the preceding day; one of those ulcerations penetrated through the peritoncal coat, inflammation of the peritoneum came on, and the patient died, rapidly, from extensive inflammation. You have always to fear some accident of this sort. It is very it may not happen in one case in it may happen. Another The patient may be

give castor oil, moderated, as to the dose, according to the necessity of the case. You may give from a tablespoonful to half an onnce, or six drachms. Remember that in women, when they are the subjects of such disease, they are very greatly distressed, because the frame and nervous state of women are more easily excited than those of the other sex, and you must with them, probably, resort to musk and camphor. Some will perhaps say that this is an inflammatory disease, and that you are ordering sti-mulants. Well, but you are to keep in mind what you are to do. It may be true that you are for the time supporting a very serious injury to a part at a distance, but then you are not relaxing your efforts to core the disease. I have dilated upon this more than perhaps I otherwise should have done, because at this time there are a great number of such cases, and I am quite sure, from my experience, that if they are treated as the case you have seen has been treated, nine out of ten will do perfectly well, even if you never see them again, should the same treatment be continued long enough. Still, you have always to fear a relapse,sometimes a sudden fatal termination. I remember having seen two cases in which perforation of the bowels took place from illeration, just at the time the patient seemed to be getting better. I have seen those alcerations of an extent varying from the size of a pin's head to a size only a little less than that of the palm of my hand, with large raised edges and slonghs. Such cases, however, in later years, have been more rare; but in one year, when an epidemic prevailed, there must have been as many as twenty-three cases in this hospital, all of which were declared to be labouring under this disease. Latterly we have been very free from it. I had some drawings, gentlemen, to show you, but the darkness of the evening will not a luit of it; I shall, however, take care that at our next meeting we shall have lights, when you will be able to examine

state of healing, but the process of cure had

not been carried far enough, when some-

thing obnoxious was taken into the stomach

and bowels, and then the vital parts became more affected than they were in the first

instance. There is more heat of skin, more

sinking, and the patient is worse than ever-

What you have to do in that case is, to endea-

your, as far as you can, to cure the disease,

and to support the strength at the same

time. Here wine may be given, and even uonrishing food, with great advantage. Sometimes if the bowels are exceedingly

irritable, it is necessary for a time to give

injections of starch and opium.

There are several cases of the progressive ease," as it is called, now in the house.

bout may be taking What is them. There is that unhappy man Noland, who has would least suspect it. They may arise universal palsy. There is a man in the bed from slow disease of the brain, of the naopposite to him, the "sneezing man," as he is called, who labours under a very peculiar state of the nervous system. There is another man, in the same ward, of the name of Williamson, who does not appear to me to be quite right in his mind, with paraplegia. I think these are the only three cases of importance. I am very fortunate in this respect at present, because in general I have a great number of those brokendown cases.

Now, then, there are two conditions in functional and its structural conditions. You are to remember, as a general rule, that the functions of the brain may be disturbed to any extent, without any percepti-ble organic disease. But when there is permanent loss of sensation and motion in any of the limbs, and more especially if it be confined to a single limb, and is not the effect of rheumatic inflammation, it is a proof that there is organic affection of the brain; and dissection shows us, invariably, then recovers sensation or motion in any of his limbs, there is generally organic disease of the ban. When the patient has lost in labouring under universal pa the use of his limbs, and that loss is at- arms and both legs were tended with trembling - when he sees was nothing alive but double, or when he sees only half an ob- bowels. At that ject,—there is great reason to suspect dis- and the function ease of the brain, and such cases are very brain were disputed took dangerous; they are dangerous when you from him, as it ther case; pu

ture of scrofulous tubercles, or even what has been termed "softening" of the substance of the brain, which, as far as I know, in the adult, is a disease of the extreme arteries. All these are cases of organic disease of the brain.

When a patient has had what is called an "apoplectic fit," and he recovers with loss of sensation or motion o one limb, you are pretty sure that there has been on the opposite side of the brain an extravasation of blood. Though the extravasation has not which you are to look upon the brain,-its been sufficient to destroy life, it has remained there; the red colouring matter which it contains has been absorbed, the mass of matter has been, as it w re, drilled through with small holes, and remains there doing no harm. That I think is the most common cause of palsy; and the case is called " recovery from apoplexy," though the limb still remains impaired. Sometimes we have extraordinary instances of this, We had a very extraordinary case of it in the hospital the other day. A man tumbles organic disease of the brain. If a patient out of a gig and gets a violent blow on the is paralytic,—not a young woman, who head, or a severe fall,—or, like a friend of does not know what the devil she would ours in the hospital the other day, he gets a be at,-her case may be hysteria; but devilish good licking, and becomes paraif the patient have paralysis, where there lyzed. There was a man twenty-five years has been a fit, that case is one of organic of age, a prize-fighter, who got what is disease of the brain. Ordinarily speak-called "a belly-full," or, as I should rather ing, if there be paralysis of a limb and say, a "head-full," for he came into this loss of sensation, and it has come on very hopital perfectly paralyzed in all his limbs, gradually, there is disease of the brain. In He did not see double, nor did by see half the great majority of instances, disease of an object; his mind was perfectly undis-the brain is first shown by some loss of turbed, nor was any portion of the body power, or diminution of scusation, in some more affected than the other. I looked one or other of the limbs. If a lower upon this as a case of congestion of the limb is affected alone, it is called "para- brain, or such an injury as to cause a larger plegia;" and I believe that the term em- portion of fluid than natural to enter the ployed is the same where there is an affec- brain, -not enough to destroy life, but suffition of a leg and an arm, as in the case of cient to interfere with the proper functions our "sneezing" man. If it be on one side of that organ. When he came under my only, it is called "homiplegia." These are care, I cupped him every six weeks from the common expressions that are used in men-back of the neck, took a small quantity of tioning cases of paralysis. Now it is a most blood from him, gave him calomel, applied uncommon circumstance to meet with these in blister to the spine, and dressed it with diseases, without there being organic dis- mercurial ointment, and in the space of ease within the brain. In very old people, little more than two months he was able to simple pressure of blood upon the brain walk about. He then began to move his will produce palsy. In those cases, and arms, and after a progressive state of imwhere the palsy has come on without a fit, provement he went out by his own desire, it is very easily cured, which is a matter of 1 have no doubt that that treatment, if it great importance; but where there has been had been kept up, would have entirely a fit, and the patient has been deprived of cured him; but I have no idea that his was sensation and motion for a long time, and a case of organic disease of the brain-it was a mere case of extravasation of blood.

Well, then, as to Holland who came

LECTURE

INTRODUCTORY TO A COURSE ON HYGEINE,

OR THE PRESERVATION OF

THE PUBLIC HEALTH,

WILLIAM FARR, Esq., SURGEON, LONDON.

Delivered October 28th, 1835.

GENTLEMEN,-The subject of Hygeine, ...

"Hygeine" is a naturalized French word, In its present form it is not, as Dr. Formes Now, gentlemen, this brings me for the present to the conclusion of what I have to graphy," very agreeable to the English car; say to you of paraplegic cases, and the treatment of disease of the brain. There is really logy, but from the dread of attempting two little to be done in them. However, I shall innovations. It is considered equivalent to be able hereafter to illustrate my views far- the art of preserving health; and while the ther, by a reference to other cases in the exercise of Therapeuties restores the sick to hospital as they occur. Our old gentleman health, Hugeine is said to teach how life is I do not expect will get much better; but preserved Life is valuable, -- "All that a man Noland, I think, will, as well as the man hath will be give for his life," - and health from whose head I have endeavoured to is a blessing which sweetens every other produce a discharge. He is now getting joy, or hears men up even against misery; better, and that discharge is in effect the so when private individuals only are consame as if a seton had been applied. You sidered, health and the extension of existence are thus keeping up a constant discharge by the use of mercury, effecting a considerable to be attained at the expense of almost any drain from the vessels that supply the head, sacrifice. Every member of the body may and, probably, coming nearer to the sent of the lust, all its form and loveliness may have injury than you could approach with a seton. perished around it, the intellect itself may

heart, to sure which -to

vivendi,-hygeine itself offers no incentive.

Although the preservation of health and the prolongation of life are the great objects constantly to be kept in view in private hygeine, they are subordinate in public hygeine, where nations are considered to the higher end of developing the human faculties, and raising them to their greatest possible degree of organic perfection. Regarding mankind with a general eye, would an intelligent being desire to see a feeble, imbecile, effete population, vegetating through an antediluvian age of some eight hundred winters; or would be attempt to call forth all the energies of humanity, to flourish for a few years or generations, and then to ebb with terrible revulsion? Would be not rather seek to temper the intensity of life, so that, when multiplied by time, the greatest possible sum of vitality might be produced

"Hael," the Saxon root of "Health," implies strength-hence we have "a hale man: "-and "Healer" was a bestower of Health. "Physician" and "Saviour" were translated by the Saxons "Healer." In In speaking of the preservation of health, I wish its enactments. Moses was learned in all health to be understood as implying not only the wisdom of the Egyptians, and adopted that smooth course and conlibrium of the functions which is now commonly indicated by the word, or the state to which patients are restored after sickness, -but the strength bondage to a land overflowing with natuand continued energy of the mental as well as the muscular system. " Cultivation ' would be a more appropriate term than "preservation;" as the latter implies only continuance, while "bygcine" curploys all! external influences, and all our knowledge of the organs, the functions, and the habitudes of the human economy, not merely for its preservation, but for its improvement.

The true object of hygeine, then, is to increase the sum of ritality by extending individual life to its full term (averting death) ; by ohviating sickness; and by increasing the energy of all the vital forces, whether nutritive, formative, locomotive, or sensitive and intellectual.

A history of life, of the natural and supernatural means which nations and legislators have employed for its preservation, the plans proposed by enthusiasts, and the valuable precepts which medical men and philosophers have successively deduced from the observation and experience of mankind, would afford us abundant instruc-

in these lect

solemn duties, friends, country, or truth, for pagainst some false doctrines, which float like life, and so, propter vitam perdere causas warning wrecks on the surface of its past history.

Egypt was considered by the ancients to be the sent and source of medicine. The observance of great bodily cleanliness, strict regimen, mild dict, from which the use of several animals was proscribed; vomiting, purging, and fasting, for three days successively every month; and a simple, invigorating education, inuring the youth to hardships,-these were some of the doctrines of the Egyptians, and formed part of their laws. Physicians were included in the learned class, constituting one all-powerful priesthood, to whom a third of the land was allotted. They practised their art for the advantage of poor and rich indiscriminately, their endowed riches raising them above the necessity of requiring fees. In the time of Herodotus, it is said, the plague was entirely unknown among the Egyptians, many of whom attained a great age.

The four last books of the Pentateuch unfold a great system of hygeine, not constituting a mere philosophic unapplied theory, but enforced by legal sanctions, and carried out in practice to the very letter of several of their practices; but together with the great idea of emancipating his countrymen, and carrying them from a land of ral riches; came many profound principles of truth, resulting from the study of the moral and physiological condition of mankind, and a thorough knowledge of the external circumstances - of the country the wilderness, - through which people were to be led. On account of the relation of miracles mingled with the narrative of Mosks, some persons object to references being made to the Pentateuch; or to considering it as historical authority for scientific truths; but internal and circumstantial evidence proclaims its authenticity too strongly to justify the rejection of the facts which it contains, whatever differences of opinion may attend their interpre-VOLTAIRE SAYS that every thing tation. about Moses is supernatural: "Chaque people a ses prodiges, mais tout est prodige chez le people juif." After examining the records collected in the Pentateuch, the manners and the style of the Arabs, and all the other attendant circumstances, I think you will come, if not with WARBURTON, at tion; as it would show the human mind least with MULLER and ROETTECK, to a issue with a problem of the greatest different conclusion. I shall here assume mortance, and the highest spe- that the facts are historical, and proceed to My first step, however, develop a faint outline of the Mosaic system of Hygeine; important, because it is the literators of hygeine; first recorded with detail, and because of the mighty principles it involves. The great theological system revealed by Moses, I am and to guard neither qualified nor called upon to discuss;

in hygeine we have only to do with the ter sying creeping things were, probably physical facts.

Moses, after carefully distinguishing the contagious diseases of the Israelites, commanded that the infected should be isolated .-In Leurosy-a cutaneous affection allied in character to Tubercular Elephantiasis-the suspected man was brought to the priest, who pronounced him "unclean;" or, if there were any doubts, shut him up for seven days, until the symptoms of the case became well marked. The "unclean" were put without the camp, and only visited by the priest : their clothing was burnt. When the people possessed settled habitations in Canaan, unhealthy houses were directed to be examined, and "scraped within and round about," the dirt thus taken off being carried out of the city to an "unclean" place. The worst buildings were to be entirely broken down and removed.

In the disease of Gonorrheea, the identity and antiquity of which, will, I think, appear indisputable to those who read the 15th chapter of Leviticus, every thing and every person touched by the patients, was declared "unclean"-to be set apart and purified by washing. Seven days of purification were prescribed for the cleansing of the impure person; who afterwards offered before the congregation "two turtle-doves or two young pigeons." The minute regulations on this head deserve your attention; so do those relative to the menstruction of females, to their purification, and to cohabitation, particularly in the East, and among the Arabs. Circumcision, still practised among the same races, and, in some tribes, upon females, was intended to promote cleanliness; perhaps to prevent some diseases of the prepuce; or to obviate phymosis and paraphymosis. It was peformed on the eighth day after birth; and often must have destroyed the most weakly children, who would bleed to death, or die convulsed: at least such a result has sometimes been observed among the German and Polish Jews. "A bloody husband," said ZIPPORAH to Mosks, "art thou, because of the circumcision."

Animals were allowed for food, but a great they were remuncrated received offerings on the property asys the Jewish law, "parteth the hoof, is cloven-footed, and cheweth the cud, condition of their hy ye may eat:" swinc were excluded because they did not ruminate; coneys and hares because their hoof was not divided. The prohibition of hares would recalt on mind the modern Game Laws, were it not in conformity with a principle; and did we not know that Mossus always carried out his principles to their most rigorous consequences. Birds of prey, "whatever in the waters hath neither scales nor fins, what-soever goeth upon its paws," and all flying creeping things, except locusts, grasshoppers, and boetles, were forbidden. The late the statement of the creek of the single meal which are less defined which are less defined which are less defined which are less defined which are creeked to be a consequence of the single meal which are less defined which are l

not unacceptable in the wilderness? The ox, the sheep, the goat, the deer, and the chamois, were orthodox food; in fact, the classification excluded few animals which we now eat, except swine, hares, and rabbits. Everything that "dieth of itself" was pronounced inedible; and the blood of all animals was to be poured out .- "Ye shall catable blood of no manner of flesh; for the life of all flesh is the blood thereof." Lev. xvii, 14. Blood is rarely taken by Europeans, although it is drunk by some carnivorous animals and savages. It is not very palatable, but I am not aware that blood is indigestible. Some think that this enactment was intended to prevent cruelty; in support of which, Bruce relates, that somewhere in Abyssinia, the fierce nomads drive their cattle and cut steaks from them as they are needed; but this very much resembles MIZELD's story of the goose.*

The enactments relating to marriage, which are now adopted in Europe, were founded on the physiological law, that a degenerate offspring results from the intercourse of animals which are nearly related; and that a proper mixture of alien blood, can alone give birth to an untainted and vigorous race. Consins and near relations, by being brought into contact when young, and when the affections are opening, too often lay the foundation of matrimonial alliances which infringe upon the general laws of Hygeine. What would have been the result of allowing the commbial union of nearer relatives? denouncements of adultery, which was punished by death, and the strict investigation of virginity, discouranted promisenous intercourse, - destructive of the honds of families, calculated to yield a degenerate spurious issue, and likely to involve nations in exhausting pernicious diseases. Such a restraint was necessary, and justified by the truths of physiology, as, in the language of BEAUMARCHAIS, man is the only animal " qui boit quand il n'a pas soif; et qui fait l'amour en tout temps.

The Levites (the priests or learned easte) were the medical advisers of the people; they were remunerated from the tithe, and received offerings on recovery. Jenovan himself was his people's physician; and on condition of their hygeinic and religious obedience, declares, "I will take sickness away from the midst of thee; the number of

^{*}Animal food is so abundant in some parts of South America, in Chili, for instance, that it is not uncommon in that country to kill a large legal which a few travellers can make the sake of the single meal of a few possets which a few travellers can make of its carcase, the remainder belt to appear the hunger and a male which are less that when feet has been for heat of a climate within a feet the statement of a few may have a feet the statement of a few may have a feet the statement of a few may have a feet the statement of a few may have a feet the statement of a few may have a feet the statement of the statement of the feet the statement of the feet the statement of the state

ic laws. In the accomplishment of his himself acquainted with the physical conditawgiver spared no lives: at tion and the philosophic doctrines of the of his own people were surrounding nations, Lyoungus returned conquered tribes were to Sparta, and established a new legisla-ter riches were uppro-tion, founded on education, which he looked to only who had not upon "as the greatest and most glorious were the to augment the work of a lawgiver." The children were children. Nowithstanding the taught to endure labour, to fight, and to duced from them might be the same. At men which we now call " barbarians." certain festivals they sang and danced, unpresent a picture sufficiently revolting to the better feeling of this age, to us of the nineteenth century, who send foundlings to hospitals, nurse scrofulous infants, and educate the children, even of the labouring poor, in workhouses. Yet revolting as this system seems, it formed LEONIDAS, and the three hundred who fought and died at Thermopylæ " to obey the sacred laws of their country." It was founded on physiological laws, and realized at a great expense of suf-

gree of vitality. This investigation of the hygeinic legislation of the Hebrews and the Spartans, appears to me to preclude, to a certain extent, that these cold-bath are a the necessity of further historic inquiry into stitute for both the Spartan exami

extraordinary energy and an uncommon de-

conquer; they were lodged in the country; the hygelne of ancient and harbarous na-went barefooted, played naked or wore one thons, for their institutions embody the prac-upper garment, and slept together on tices not only of the carly, but of the modern rushes. They were fed on coarse spare dict, exposed to alternations of hunger and scattered over the earth, and present them in thirst, bodily suffering, and fatigue, and a tangible, but improved and refined system. practised severe gymnastic exercises. After Hunger and necessity exposed the North an animal is born, its character and nature (American Indian to the hardships and danare cast and fixed. So the education of Ly-gers, the alternations of heat and cold, the curacts began before birth. He sought at inquition and fulness which the Spartan laws its source and root to fashion the Spartan enjoined; the Indians were taught manual race in the iron mould of his system; for dexterity; their eye and senses were keen; this purpose he first reduced, according to they too could endure corporal suffering, ARISTOTLE, the women to some rule: "he and smile in the very pangs of death; they ordered the virgins to exercise themselves also disciplined their women, and abandoned in running, wrestling, and throwing quoits their weak children. And so it was not only and darts; that their bodies being strong in North America, but in South America, and vigorous, the children afterwards pro- and among all the vigorous races of savage

In order to understand a system which apparelled, but with all modesty, before attempted to augment the sum of a people's apparence, but with an industry, increase and the fathers, the young men, and all but the vitality, by eliminating and printing remocked and scorned bachelors of the city; morselessly away all the weak shoots, and, to use the expression of Plato, drew imagine 1800 children born on the same day the young almost as necessarily by the at- at Sparta. They are taken before the elders, tractions of love, as a geometrical conclusion and a certain number are rejected; those follows from the premises. On marriage, that are strong and well-proportioned are the bride was carried off by violence; and carefully educated, and their bodies are temonly seen illicitly by the bridegroom, neither pered by discipline to the circumstances in oppressed by wine, nor enervated by luxury which they are destined to move; after the (Plutarch). The father could not rear his expiration of twelve years, only 1000 reown offspring before he had carried it to the main. Now conceive the same number elders; who, if the child was strong and well- 1800, born in a n ighbouring city, where proportioned, left it with the mother, and the circumstances are nearly the same, with gave orders for its education by the the exception that all the weakly children state; but if it was weakly and deformed, are tenderly brought up, till they are driven commanded it to be thrown into a deep care by necessity from their parents arms. How wern near the mountain Taygetus. The many of such children would be alive at the women, too, washed their new-born babes end of twelve years? Not all, but probably with wine, to try, PLUTARCH correctly adds, more than 1000; more lives would exist than "their habit of body; imagining that sickly at Sparta, but the vitality of many of these and epileptic children would sink and die saved children would be feeble, their lifeunder the experiment, while the healthy time would be impaired by sickness, and would become more vigorous and hardy." afterwards, in youth and in manhood, they The public education began at the age of seven would be swept away by the implacable seyears. For further details on the Spartan verities of a rude and uncivilized state, if these ARNOPHON, and PAUW. These outlines lived to possess offspring, and that offspring extended to three or four tuberculous, scrofulous, enfeebled generations, their proportion would be augmented; while organic debility was weeded from the Lacedemonians, the North-American Indians, and vigorous barbarians, in its germ, by the laws, and by the stern discipline of nature.

The Russians, in an extreme climate of rapidly alternating heat and cold, still bathe their young infants in the cold rivers, and then bring them suddenly to the warm fering and life, the idea of Licungus, in stoves, to harden their constitution, accord producing a chosen nation, endowed with ing to Rus-ian writers. I shall provi experiments, and the relative infants in the warm and extreme cold destroys blooded animals; wh

the deep cavern near Taygetus. That some | you will find that the system of breeding

Wales, for the first five years of life, were tion of domesticated animals to the human 46 per cent, in the six years clapsing between 1818-24. Admit that the mortality laws we have just passed in review; many in infancy had been greater, and that many of the weaker children had perished, is it not probable that the mortality in manbood five years of age, die annually per thousand; the influence, and the means of and in manhood, between twenty and thirty the influence, of hygeinic agents. years of age, 9; between thirty and forty, exactly 10 per thousand perish; while, at the same ages in England, 10 and 12 instead of 9 and 10 per thousand are lost. You perceive here an oscillation in the line of vitality,—in the proportion between the dying and the living. If it is lowered at one time, it rises correspondingly at another. Again, where the temperature, the place, or the social condition, renders life difficult of preservation,-where the external hygeinic conditions on which our physiological processes depend are unfavourable. -the deaths in infancy are immensely augmented, in order to raise the subsequent period, destined for the production of the species to a certain pitch of vitality, below which its generations would cease. In the cold climate of Sweden, instead of 45, as in England, 90 per 1000 died annually in infancy (1755-75). Between the ages of twenty and forty, however, the mortality was not quite so great as in this conntry. In Stockholm, out of 3000 born, only 1000 survived the twelfth year. You conceive, perhaps, now, that notwithstanding bave been as great in Sparta gorse climates, where cold or even in the same ata were reared.

great cause of mortality exists among the and training-directed not to increase the Russian children none will doubt, when longevity of those animals, but to give them they learn from Sir Francis blvernors, imuscular strength, velocity, and sagacity, or that at Nigni, near Novogorod, out of 1000 simply weight and ficsh,—has been eminent-baptisms, 661 die before attaining their ly successful. ON THE

TREATMENT OF FRACTURES

WITHOUT THE AID OF SPLINTS.

By W. C. RADLEY, Esq., M.R.C.S.L., Newton Abbutt. Devoushire.

(Continued from page 17 k)

THE importance of the primary treatment of fractures during the first three, and up to ten days, of itself constitutes an apology for stating what every surgeon knows, viz., that the weak lotion of a solution of superacetate of lead, in the proportion of a drachm to a pint of pure water, can be converted into a decided astringent and repellent, in cases of tumefaction, by adding sixty or a hundred grains of alum to the lotion. I know of no better lotion to fulfil the latter intention than such an application, to wet a bandage. "Pour le plaisir de changer," we have the liquor aluminis compositus of the London Pharmacopacia, perhaps too strong by twice over; but that can be modified od libitum. With of sheep, of ores, in this coun-nectrace of English race-horses,

therefore they are soft and yielding; what as to the due quantum, "wisdom should harm, then, can they do?" I ask, "What be present to direct it." good can they do, which the simple pillow would not effect? Are you not thus striving of splints is this, that splints keep the extended any proach the pillowy mode? You have tremities of the fractured ends of the bone relaxed a little, and softened down your in contact. Attend to Sir Astley Cooper's grant that this is the least objectionable of once admitted in their place, the tribe of splints; but even this is unneces- 1 shall now aim to prove, way my instructor, a talented surgeon (Dr. ago.

One paragraph respecting the more argumentative reasons why the splint is employed, and I quit reasonings for facts. A judicions writer (Mr. S. Cooper; says, " Hence there is a necessity of employing means for fixing the broken limb so effectually, that it may continue perfectly motionless during the whole time requisite for the union of the fracture." The truth of this I positively deny. It is not necessary that any limb, with any kind of fracture, should be kept so perfectly motionless. True is it that Sir Astley Cooper, at page 382 (before quoted), says, "The arm should be supported upon a splint, so as to be kept perfectly free from motion." These latter words are synonymous with " perfectly motionless." They echo the same sense. But in page 97 of the "Treatise," there is a discrepancy with some of the contents of page 382. In a note to that page, speaking ommon fractures external to a joint, Sir the following important moniby moving the bone from

perfect immobility,-a theory founded on "But, perhaps," say some, " the splint is erroneous perceptions. Of course too much padded, and the pasteboard is wetted, motion would produce great mischief, and

treatment, in an extremely painful case; and admission on this point; I quote verbatim, if the pillowy mode is the best in a despe- as in all the other instances :- " When a rate case of fracture, how much would it fracture occurs amidst muscles, those which advance the cure in every common and less are inserted into the fractured part of the dangerous case!" Take this syllogism : The bone, have generally a tendency to keep the application of a pillow is right in the worst extremities of the bones together, with some and most painful cases of fracture. Why? few exceptions." Why then use splints? Because of the pain. But every fracture is The display is one of false science to effect painful; ergo, every fracture should have a what nature does by a natural process. If pillow. But Sir Astley recommends stiff this in the generality of fractures be true, pasteboard, macerated in water until it be- (and what good surgeon will deny it?) the come so much softened as to admit of its arguments for splints are a waste of breath, being moulded to the shape of the part. I and the simplest mode of cure should be at

I shall now aim to prove, that in no case sary, and inflicts a modicinu of pain, which, of fracture whatever that of the radius even, is injurious. Soaked pasteboard, or sometimes excepted; is anything more relight millboard, is only useful to envelop quired than a strapped pillow, with its padthe arm or the leg of a person who must ding, a tailed bandage, and such lotions and prematurely labour after a fracture. In this dressings as it may be proper to apply to the surface of the limb. Simple fractures being John Hughes) of Liverpool, was accustomed by far the more numerous, are those with to use these materials nearly thirty years which we shall have most to do. The "exceptions" are fortunately few, and if they (attended, as they too frequently are, by desperate and complicated circumstances) cannot be cured, they must, I suppose, he placed in the "chapter of accidents, usual way. My theory and practice shall be drawn from bond-fide cases, -not manufactured to support views that need the friendly aid of fictitions natients.

CASE 1 .- Mr. Moses Crossman, sen., of the village of East Ogwell, in 1819 fractured his tibia by a fall from a horse, or, I rather think, by his horse falling with and upon him. It was a very bad simple fracture, attended with tumefaction and pain. One unfavourable and vexatious circumstance was (too common in country practice) the distance which I had to travel before I could get to the residence of the nationt. Although there was much swelling in this case, yet an aluminous lotion and a tailed bandage, with the aid of a pillow and straps, cured this fracture in five weeks, when Mr. Crossman quitted his bed altogether for the day.

At this period, every case of fracture was a battle of words between the friends and

beet by mying, that at common transporter, and are compound. But no tture to say, that what is safe in a com- case is the same.

mon fracture must be inadmissible in a compound one. Practure is fracture, and the nature of either

myself, about the non-employment of the | natured smile of incredulity from Mr. Gaye, splints: in the present case, the Rev. Mr. -e called in while I was engaged in the remedial operations on the leg. His stay was short. It developed a few questions on the "usual means" of curing fractures, accompanied by a look of contempt at my simple mode, and ended in a sneering sentence, muttered in the door-way, about "dabblers in the art." I only smiled, allowed the ill-bred gentleman to go his way unanswered, and resolved to persevere in my plan of curing fractures with as little pain as possible to the patient, who in this case was a healthy man of forty-five, who, as I have said, soon got well, and prided himself as much after the fracture on his small leg with a light low boot, and fine muscular calf, as he had done before it, and with as good cause.

CASE 2.—This occurred nearly seven years ago, and shall be related at greater length, because more witnesses can be cited to prove the truth of the details : - Mrs. Alsop, about seventy years of age, in the month of April 1829, was placed in great peril by the fall of a stack of chimneys during a storm, which dashed, with the roof under it, into her bed-room. I then resided in the adjoining house. Hearing an indefinable crash, I dressed, and hastened into the street, and soon found my way to the scene of danger. The bed was demolished, and the old lady lay under a great weight of bricks, slates, rafters, &c. On being removed from her alarming situation, the tibia of one leg, and the fibula of the other, were found to have suffered the injury of simple fracture. Mr. Charles Gaye, a surgeon of valued professional ability, whose friendship I have long had the happiness to possess, was also called in; as also was Mr. W. Y. Bond, another surgeon, who usually attended the family, the extent of injury done to the vital parts not having then been ascertained. But as I was first present, the more immediate care of the patient was willingly confided to me by Mr. John Alsop. We (the surgical trio) now formally deliberated on the case, and the best mode of securing the fractured limbs, when the following dialogue occurred.

Mr. Gaye. "Why, Radicy' where are your splints?

R. " I never use any; I have not used any for many years.

Mr. Gaye. " Where is your authority for that practice?"

R. " I have none but my own experience. that splints are useless in fractures.

Mr. Bond. "What! set a fractured bone without splints? I never heard of such a thing in my life!"

Mr. Gaye. " Nor I."

R. " Well, let me have my way on this occasion, and you shall have yours another

The concession was granted with a good-

and a polite assent from Mr. Bond.

Mr. Gaye. " Proceed. We will look on." Three lengths of tape, each of two yards, were each doubled, and laid on a common feather-bed, and on these straps a feather pillow, heaten smooth, was laid. Boyer would have exclaimed "C'est tout trop donx!" It is all too soft! Pardon me, say I, it is not too soft in any case. A sixteen or eighteen-tailed bandage, I don't remember which, was laid on the pillow, and the patient carefully removed to the bed, and the most painful lumb, that with the fractured tibia, was placed on the pillow. A reduction was then gradually and effectually made, the tails of the bandages were lapped over and over, and the sides of the pillow were brought to the sides of the leg, gently supporting it in situ, while the straps became a threefold means of keeping all steady. To support the foot, a piece of tape was sewn to each of the lower corners of the pillow, and tied close underneath the sole, which it supported much easier and better than does the usual " foot-board." My two friends assisted me, with many a humorous wink.

The leg was placed in the straight position, and rested on the calf and the heel. In order to relax the muscles to the hatt-bent state, or the degree of semification, a large piece of flannel, perhaps a petticont, is, in such cases, inserted between the pillow and the bed, for the purpose of raising and bending the knee-joint. The leg now presents the usual declined plane. The femme is a little thrown towards the pelvis, until the most important of the flexor and extensor muscles of the thigh and leg lie at ease. The under surface of the pillow was, in the present case, padded up, here and there, to support the small part of the leg, until the patient, after frequent and cautions inquiries on my part, declared that the limb seemed to lie with an equal pressure on every part. This latter circumspection is very necessary to be observed. Now look at the limb! As steadily supported as a ship resting in the stocks, and yet on so soft a hasis, that nothing in it gives pain or uneasiness. What principle of surgery ought to have prevented this limb from lying in so much comparative case, and the patient from reposing thus quietly? She did repose; and all persons in cases so treated, will repose likewise. All injuries will excite increased action, and produce some degree of heat, tension, and pain. The next morning my patient complained a little, and the surface of the tibia and the fibula of the other land much in the same way as its a different position, being were moistened with the much diluted. The skill ously sponged with tend water, t

wetted with the lotion above, were

and a hoop, fastened to the state of the bedstead, supported the bed-clothes on the arch of its space, and prevented them from pressing on the toes or any part of the limb, and aided to keep it cool.

The tumefaction was moderate, as was the pain, because the heat was not allowed to remain confined long enough to produce its exciting effect; and as to other irritating causes, there were none, save that of the injury, the force of which had been very great, and at the end of a week caused great tenderness on the surface, the nervous papillæ being very irritable. Tract. Opii, Spir. Vini Rectificat., and Tinet. Hyosciami, were alternately used, with a pledget of lint, bathing the surface over and over again while any under heat remained. Invaluable is this mode. The matter of heat readily unites with sulphuric ether, or a strong pure spirit, and flies off. The main point is not to reduce the natural heat of the limb much below, nor let it reach above the natural standard. On this hinge turns the state of suffering or of case in these cases. Living so near to my patient, I was enabled to attend to this frequently. Indeed, she found the heat, pain, and soreness, thus fly off together so certabily, that I was simimoded whenever there was a little return of pain. But the nurse was well able to attend to it, by turning off the tails of the bandage, wetting them, bathing the limb, and replacing the bambage as before. This was done perhaps twenty times in the day and might for a short period, and with the aid of a sedative and narcotic draught at night, and occasional doses of ol. ricini. she made good progress towards a cure. As for the incessant care with which I attended this case, and which, in narration, may seem tedious, to me it was not tiresome, though no one has a greater dislike of vicions irritability in the temper of a patient, excited as it sometimes is by factitious wants. But such a case as this (and there are many such; demanded every care. The patient was a feeble, aged woman, with all the querilonsness of numerous years upon her, justifying and amply repaying the frequent treatment of adjusting the pillow by padding here or there under it, or the occasional insertion of a little cotton wadding between the pillow and the leg, for even a soft pillow itself will incommode a surface exquisitely tender. The limb was not moved, or only passively (and then moving pillow and all together), when the bandage was remoistened, and the fractured part exposed yiew, by which nothing wrong could being seen. But not once diplace the ends of the bone. arred to effect such a to have attended who was caslly fretted by on and pain.

At the end of the third week, my patient being naturally an attenuated subject, the eye could plainly distinguish, through the integuments, the breach of continuity in the bone, marked by a rough, irregular, thick line, or cleft, descending obliquely through the bone; appearing in a vertical direction, proceeding from the anterior to the posterior surface. But not the least deviation from a straight line in the general contour of the limb could be detected, nor could the finger discover anything in passing over its course, save the oblique line or depression described.

At the end of the fourth week, by comparing the legs, it was not distinguishable which tibia had been fractured, until the finger was slowly passed over the fractured part, and on the last day of four weeks from the accident, she walked across the room, leaning on the arm of her son. Now, remember, here had been simply a rolled bandage applied spirally around the leg. I said to her, "Madani, you have heard much of splints, and have been advised by some to have them, will you now wear one, or a piece of pastebourd?" Her reply was, "Neither, sir, I thank you; I feel very comfortable, and shall be able to take care of the leg myself." And from that time forward she dol so, with no other assistant means than the spiral bandage, which was taken off every night and reapplied every morning. In the autumn of the same year, I frequently had the pleasure of seeing her walk in the street, with her accustomed light and nimble step.

Some have complained that little progress has been made in the treatment of fractures since the days of Hippocrates, but, I trust, that this is a great improvement.

Case 3.—The next case I shall relate is one of a very different character from the last. It occurred in the person of a rough labourer, from the granite mountains of Dartmoor; presenting in many respects contrast enough to the preceding patient. The Hightor quarries, about nine miles from Newton, afforded employment to two or three hundred men, and as one of these was engaged on the granite bed, in removing what is technically called "the head" (a thick super-diluvial deposit of moor-stone, lying on the more compact rock), a mass of it fell, and buried him beneath. He was carried to a cottage at Hightor vale, from whence an express was sent off to me, for it was then a part of my occupation, and one irksome and laborious enough, to attend, on contract the sick and injured workmen at this place. I found him writhing under a fracture of the right femur, three inches above the patella, —quite near enough to the knee-joint. The man possessed robust strength and rigid muscular fibre. As to

the direction of the fracture, the great tension already existing prevented my knowing much about it at that time, but I afterwards found that it passed obliquely across the bone; the mass of stone having broken it short off. The man lay on a poor feather bed, with a coarse sacking bottom, laced up with a slack hand, so he sunk down low What would Boyer onough posteriorly. have said on this occasion? "Soft and yielding indeed!"

In this state of things it would have been difficult to lay out the thigh straight, which I never do, according to Dessault; so the nethod of lying "at ease," something in limb, heat, tension, pain, spasm, and a startthe way of our surpassing countryman Pott, ing in sleep, are sure to follow. In the prewas adopted; the lower part of the thigh and the whole knee and leg, being so supported on a long pillow, and padded up better; he had perspired freely, and had underreath, that a regular plane was ob- from that derived what Mr. Pott recomthined; no one part sinking lower than the mends in strong terms; while it was to the rest. Slight extensions were made from time to time, in the hour or two employed Pott further says, "that the surgeon never to get it into a comfortable state, talking to found it necessary to have the leg or the and cheering him the while. The fracture thigh once, during the cure, removed from being reduced, the handage applied, and a the pillow on which it had been deposited." hoop employed to support the bed-clothes, I Of course I feel the great practical value of left him.

the hoop useless, and had taken it away, advantage of that mode of cure is invulu-The thigh was rather too warm, and the able which allows any old woman to open man not by any means casy; so I nailed the bandage, permit the hot air to escape, on the hoop to his old oaken bedstead, wet- and, after bathing the surface again, lay on ted the bandage, bathed the skin, and left the tails of the wetted bandage, and thus yield him casy, in a better state, with full instruc- the patient case twenty times in a day or tions to the mistress what to do to prevent night, with as much facility as she overlaps pain.

termination to all philosophic speculation, desiring me to come to him, for he had not hastened up and found him with a red face and a bouncing pulse, and the skin hot and feverish. How could this be? The hoon remained as I had left it, but on removing the coverings, cause enough presented. The careful wife, after wetting the bandage in the night, which she thought was too cold, had placed a heap of blanket under the hoop, upon the leg, instead of spreading it in a canopy over it. On removing it a cloud of hot gas arose, almost like the discharge on letting off the steam from a little engine. The causes of pain, restlessness, and fever, were at once fully explained to them, and in no very measured terms. The limb still lay well, and in a good position. Bathing the skin with tepid water first, and then with spirits of wine, caused evaporation until he said, "Cool enough now." He had a white tongue, so I gave him two large spoonfuls of the following julep, instead of abstracting blood, and left him: Antimon. Tartarizat. gr. ij ; solve in Aqua Bulientis 3j; et adde; Aqua Frigor. ad Siv ; Liquor. Ammon. Acct. 31; Spirit. Camphoræ min. xx. M. cujus, cap. cochl. maj. j om. bis hor, poster.

Some persons regard a little alteration of temperature as a trivial matter, but of all things in the treatment of fractures, thisappears to me to be the most important in the inflammatory stage. Let the limb be placed and the fractured bones be reduced with whatever perfection of art may be used, if an atmosphere, sui generia, surrounds the sent case no other mistake of the sort occurred. On the following day he was much this sentence, but Mr. Pott might, had not Second day. The "gude wife" thought his splints been in the way, have said, -- "The the belt of her gown,"-all which cannot Fourth day. Other cases prevented me be done where splints are used. Surgical riding over until early on the morning of dandyism in this case would have applied this day, when I was summoned by one of four splints, -- one above, another underthis day, when I was summoned by one of four splints, one above, another under-those hasty messages that put an abrupt neath, and one on either side; and with so many "safeguards" few surgeons would consider it safe to tie and untie them every slept during the night, from pain &c. I half hour. Besides, it would occupy too much of the time of a professional man; for surgical pride would not allow such frequent meddling with the established order of things by any old wife. Yet it would be impossible, even for a four-legged Chiron, to keep a patient easy at a distance of eight miles over the most hilly and rugged roads.

Perhaps some surgeons would have thought it right to bleed this patient as recommended by most authors, but I never yet bled a patient with a fractured bone (fracture of the rib and cranium excepted), nor shall I ever, while other antiphlogistics, Mindererus's spirit, and emetic tartar, are extant.

But to return. In ten days this. safe from inflammation and the fifteenth day from perfectly astonished to

bottom of a water brook, sinking down at tract the nearms scablel. She has been he became exhausted, fell on the ground, character. Frictions with sulphur ointment this attack that she is now under my care.

You may perceive that the disease is at present confined to the fore-arm and hand: you will also observe that the eruptions are of different kinds, some being of the true primary vesicular character, others having the inflammatory and pustular appearance, which is caused, as I have explained, by external irritation. I now select three small vesicles which I surround with a circular ink-mark, in order that we may not conthe following candid By examining the interior of this circle the "Sargical Dic-with the powerful magnifying-glass which "Mr. Sannet Cooper:—" In a I here have, you will perceive, a small ar an articulation, it is to be faintly-marked red line, diverging from the

centre pustules, at nearly right angles. This | goltre, contrary to the advice of many sur-I consider to be a small furrow or canal and if we are so fortunate in the present instance (and I succeeded yesterday and this morning in the same subject) as to find the acarus, it will be in this minute covered way. I now, therefore, take a needle about three inches long, with a fine flattened point, and puncture the pustule. I next gently and slightly slit up the integument in the direction indicated. If I mistake not I have now upon the point of my needle a small white globular body, scarcely perceptible to the naked eye. Having placed this shapeless point in the field of the glass, you will, on looking steadily at the object, see the globule, magnified to the size of the sketch which I now show you, * and which was made from an insect extracted yesterday. The insect under the glass exhibits so much vivacity in its movements, and such power in its many-jointed limbs, that you will have no difficulty in understanding the cause of the intolerable itching under which patients in this disease uniformly labour, and which we should find it hard to explain on any known pathological principle.

The acarus scabici, as you are probably aware, belongs to the order aptern. It has, as you may perceive, eight legs, divided into flexible joints. The legs and proboscis are of a purple-red colour, as though injected with dark venous blood, but it is rather remarkable that the colour disappears almost entirely after the insect has been kent for some time. I have here one which was taken this morning from the same patient. For nearly an hour after its extraction this insect exhibited the same coloured appearance. But you will observe that the legs and head are now both nearly colourless. The body of the insect which I have last shown, is dry and shrivelled, very different from the full form and gelatinous appearance of the recentlyextracted insect. In both cases numerous small spiculæ or hairs may be seen passing off from the extremities and body of the animal.

LICATURE OF THE SUPERIOR THYROID ARTERIES.

IN CASES OF

LYMPHATIC GOITRE.

REPEATED success has confirmed Professor Chelius, of Heidelberg, in the favourable opinion which he has held for several years, on the propriety of tying the superior thyroideal arteries in cases of large

100

geons. In all cases of lymphatic goitre, where these arteries are much dilated and sensible to the touch, this ligature is as much indicated as in the vascular goitre. In four cases, where M. Chelius has tied these arteries, the success of the operation was not retarded by any accident; the tw following will serve to show what benefit we may hope to obtain from the process, even under the most unfavourable circumstances.

Case 1 .- G. Haltenstein, twenty-six years of age, was attacked at the age of fourteen years with a tumefaction of the thyroid gland, which gradually increased. At the age of sixteen, in consequence of the patient having carried a heavy load on the head, the tumour became much larger, and during the last two years remained stationary. The goitre now presented a Rearly uniform tumefaction; however, the left labe ascended somewhat higher than the right: the tumour also exhibited a central, and two lateral portions, divided by two farrows, very sensible to the touch. The tension is equal throughout; the skin not altered, merely covered by blue varicose veins. The tumour extends from the os hyoides to a little below the upper part of the sternum; its dimensions before the operation were as follows :-

The greatest circumference at the base of the tumour, 25 inches, 4 lines.

Distance from one angle of the lower jaw to the other, measuring over the tumour, 18 inches, 6 lines.

Transverse measurement at the most vohuninous part, 15 inches.

Perpendicular measurement from the os hyoides to the stermm, 7 inches, 10 lines,

The left thyroid artery was felt beating for the extent of about an inch at the left upper angle, but the vessel was not enlarged On the right side the pulsations were more sensible, though more feeble.

The inconveniences occasioned by the pressure of the goitre were very great; the patient slept but little; he swallowed with difficulty; the respiration was short and difficult, and on the least effort he was attacked with pain in the head and oppression about the chest.

The ligature of the left superior thyroid artery was performed on the 23rd of March. 1834. Its traject being determined by the pulsations, an incision was made in the direction of the vessel, which was isolate with difficulty from the tissue of The wound was immediate sticking-plaster, and the bled. Rest and a try-were ordered. It felt well enough the tumour flattened on the left side, and was

^{*} An inch and a half in its long diameter, and very similar to the engraving which we gave of the animal in THE LANCET for Oct. 4, 1834, page 61.—
Eo. L.

on the fourth day after the operation the tumour was reduced to the following diincusions :-

Circumference of the base diminished by 5 inches. 5 lines.

Transverse measurement, diminished by 2 inches, 6 lines.

Persendicular measurement, diminished by 3 Inches.

The inconveniences to which the patient had been subjected now gradually disappeared, and he was soon able to return to his ordinary occupations. The tumour continued to decline. Towards the end of 1834 the left side had become remarkably smaller than the right, and the patient enjoyed the full exercise of all his functions; he was advised to submit to a new operation in case the right side of the tumour should increase and give rise to any inconvenience; but as yet this has not happened.

Case 2.- N. K., 30 years of age, of a weak and scrofulous constitution, perceived the first trace of goitre at the age of 11. The disease was hereditary in his family, his mother and five of her brothers and sisters being also affected. The tumour having gradually increased, and occasioned uneasiness in respiration, the patient, who had previously tried various internal remedies in vain, presented himself for treatment in June 1832. The tumour, as large as the doubled fist, corresponded to the left lobe of the thyroid gland; it had a pear-shape, and the inferior rounded part hang down upon the upper third of the sternum. The tumour was hard and uneven, and exhibited in several points traces of the application of the seton. The superior thyroid artery, very much dilated, was felt pulsating strongly, over a great extent of surface. In this case the knotty form of the tumour, its long duration, and the change of texture produced by frequent applications of the seton, left little hope that ligature of the artery would be attended with success; the case was one which rather seemed to require extirpation of the gland; however, the ligature was chosen as a means of rendering at least any secondary operation more casy. The two superior thyroid arteries were therefore tied; the wound healed readily by the first intention. The tumour immediately became more flaccid and soft, and gradually diminished in a manner beyond all expectation. After having remained a considerable time in the hospital, during which the swelling still decreased, but not very bly, the patient was discharged, with return again in case of ne-

followed, according to

of Heidelberg, From

insensible. The wound healed rapidly, and | Professor Christies, for the ligature of the superior thyroid arteries, should vary according to the circumstances of the case &c. As it is impossible to determine beforehand in what direction the first incision should be made, the Professor considers the rules laid down by JAMESON, ZANG, WAL-THER, LANGENBECH, and others, as illusory. He thinks that the vessels never pursue a constant direction, and are, moreover, frequently displaced by the tumour. The only guide we can follow is the pulsation of the artery. We are sometimes compelled to take it up above, and sometimes below the omo-byoidcus muscle, but in either case this is done with equal facility.

CARR OF

CROUP WITHOUT COUGH.

THE following case, observed by Dr. Michaelis, is so interesting, that we are induced to extract it, nearly entire, from the second number of Hufeland and Ossan's Journal for the present year :-

Case .- In the month of February 1831. the author was called on to see a child who had been dangerously ill for several hours. The patient, between four and five years of age, had been quite well the day before, and was suddenly taken ill within a few hours of the visit; when first seen he was lying on his back in bed, and the face was expressive of great anxiety and suffering. On examination, nothing could be discovered but some trouble in the respiration. There is no pain in the abdomen or head. The disease was therefore regarded as a severe inflammation of the lungs, and some leeches were applied to the chest, and ammonia and tartar emetic were given in small doses. At five o'clock p.m., the child's state was much worse; the difficulty of respiration is so great as to cause apprehension of instant death; the child lay immoveable on its back, the head was thrown backwards, and the arms stretched out on the bed so as to form a right angle with the rest of the body. The little patient had not yet coughed, and, indeed, it was doubtful whether he was hourse before, as the parents are not certain on this point.

The absence of any cough in the present instance was calculated to throw great difficulty in the way of diagnosis, and after having reflected at the bed-side on the various affections of the respiratory apparatus to which children are subject, M. MICHARLIS was induced to ask himself, "Could this be an example of croup without cough?" Every effort was made, but in vain, to force the child to cough, until at length the object was obtained by forcing him to respire the vapour of strong vinegar; this produced the wished-for aspect; a violent cough, having all the characters of the croupal cough, came on. The true nature of the disease was now manifest. A vomitive was immediately ordered, and the child threw up a quantity of glairy mucus, and a substance whose membranous nature was quite evident. The repeated vomiting was followed by a marked improvement in the respiration, and the little patient lay with his arms more close to his body. Leeches were now applied to the neck, and calomel, with sulphur, antimonii, was administered, to procure copious stools. On the following morning the child appeared much better, he slept pretty well, and the cough was softer and more casy. Towards morning a general sweat had come on; the respiration was much more free, and without any peculiar tone. The caloniel powder was continued, with the antimony, and, finally senega was given, and in four or five days the child was so completely recovered as to be able to play about with his companions.

M. MICHAELIS justly considers this case as unique in the records of medicine; because the cough, which all writers mention as the pathognomonic symptom of the discase, was here artificially excited, while in the cases given by HEIM, the true nature of the disease was not discovered until after the patient's death. In his excellent treatise on croup, HKIM makes the following remarks :- " Even the best physician may mistake the nature of this disease. Not long ago a child two years of age died at Berlin, who had been hourse before he was attacked with the disease, and therefore did not present the change from a clear to the croupal voice. It was only two days before his death that I discovered the true nature of the complaint, and that principally from the circumstance of his having the head constantly thrown back; all aid was now too late to save the infant's life." And in page 15 he says :- "We sometimes observe catarrhs without any hoarseness, and the latter symptom is frequently but slightly marked in several cases of cronp, but when it is very much developed, the patient is incapable of preducing the characteristic tone." Finally, at page 19, he says:-"When the voice is totally extinct, the physician may readily be deceived; I confess that I have been mistaken this way more colouring and other animal m

than once." These citations prove, beyonds all doubt, the existence of croup without its peculiar cough, and it seems strange that the circumstance should not have drawn the attention of writers on diseases of children, to whom HEIM's work cannot be unknown.

In the first case of croup which we published in the first number of the volumes of THE LANCET for the present year, page 29, the child's voice was completely extinct, and the efforts of cough took place without any of that crowing sound which is peculiar to croup. The absence of these two symptoms is noted in the report of the case, but as no doubt whatever existed as to the nature of the disease, sufficient attention was not paid to a circumstance which, in other cases, would certainly have rendered the diagnosis very difficult if not impossi-

EXISTENCE OF SUGAR

IN THE

BLOOD OF DIABETIC PATIENTS.

A PAPER on this subject has been published in one of the continental journals, by M. Ammosioni, head apothecary to the hospital of Pavia. Chemical research has already miaced beyond doubt the existence of saccharine matter in the urine of persons affected with diabetes mellitus, but the presence of sugar in the blood or other fluids has as yet remained very doubtful. Marcet. Wollaston, Pront, Kane, and, lastly, Berzelius, have endeavoured to discover it, but without success. Wollaston was so frequently disappointed, in his attempts at discovering saccharine matter in the blood of individuals labouring under this affection. that he was led to conclude, either that the sugar is formed in the kidneys, or, being produced in the stomach by an imperfect digestion, is carried at once to the bladder by some unknown passage. The pharmacien of the Pavia hospital has been more successful in his experiments. In the month of June 1834, Professor Corneliani forwarded to him about a pound of blood drawn from the arm of a patient whose urine had furnished a large quantity of sugar. The lowing process was employed for i The clot and serum, mixe quantity of water, were the liquid parts separal lated by a liter. The a dull-red colour.

treated with the subacetate of lead, which | there is at first little alteration in the form threw down a dense, dirty-white, precipitate. of the organ; as the enlargement advances, A current of hydro-sulphuric acid was now the tumour becomes more globular, the passed through the mixture, to throw down the lead; the residue gave a pultaceous, dark mass, which, when diluted with water and filtered, became a brown liquid; this latter was boiled in an aqueous solution of white of egg, which, hy coagulating, divided the fiquid into two parts, one flocculent, brown, and insoluble, the other liquid and colourless. The latter, being gently evaporated, gave a sirup analogous to the same which had been extracted from the patient's nrine. The sirup, being laid on one side for a few weeks, gave rise to the formation or colourless crystals of a prismatic form, and with a rhomboidal base, in a word, exwashings, the vinous fermentation was soon amounted to about one ounce; the crystals of sugar weighed nine grains.

The same chemist has also analysed the blood of a female who died of diabetes mellitus, but he was mable to find the least trace of sugar, either in the blood itself, or in the serum effused into the cavity of the pleura.

VENEREAL DISEASES OF THE TESTICLE.

Abstract of a Communication by J. W. CUPACK, M. D., of Stevens's Hospital, Dublin.

So many surgeons of the highest authority have admitted the existence of venereal affections of the testicle, that we must assume the existence of an acute or chronic enlargement of the testis, originating in the action of the venereal poison, to be proved; but here our knowledge, derived from published opinions, ceases. These effections have nover been classed, described, or explained, according to their differences, from dissection. From the general conviction of the profession, Mr. Cusack considers himself justified in assuming the existence of a disease of the testis depending on the presence of the venercal poison in the system; at the same time he admits, that as the disse occurs in the more advanced stages of ional lucs, and after the use of meraust be entertained as to the nstitution and treatment as he has observed

the body of the testis, and

epidfdymis soon being lost in the general mass; the tumour has a fleshy feel, but differs much in density in different parts. Partial adhesions in the cavity of the tunica vaginalis, combined with effusions into that cavity, even independent of the internal changes which may be going on, render primary smoothness and uniformity of the surface an uncertain symptom; so uncertain indeed and so little uniform are the primary appearances, that Mr. Cusack believes that the best practitioners would be unable to make a perfect diagnosis of the disease, if unacquainted with the history of the case, and the attending circumstances. Its teractly similar to those of sugarcandy. The mination is either resolution or suppuration non-crystallized sirup having been exposed or induration, and the formation of granu-to a temperature of 26°, R. with a little beer- lar bodies, ending in total destruction of the functions of the organ. Mr. Cusack hesideveloped. The quantity of sirup obtained tates to believe, and is unable to aftirm from from the pound of blood might have his own practice, that this affection of the testis is met with in the earlier stages of secondary symptoms, or during the presence of any of the forms of true papular eruption. The acute form accompanies venereal hectic, pains in the bones, and either a scaly eruption or perhaps a solitary spot, apparently belonging rather to the genus acne; but these instances are comparatively rare, and of fifty patients at present under treatment in Stevens's Hospital, there is not one case to adduce in confirmation of such an opinion. The patients who suffer from this affection are those persons who labour under affections of the periosteum and bones, and bear the marks of having suffered from pustular and tubercular eruptions. Specimens of the disease were submitted to the Surgical Society, and these were wholly derived from persons whose constitutions were broken down from the protracted forms of the disease with which practitioners are familiar, but neither from his own opportunities nor from any other source could Mr. Cusack exhibit a specimen of the changes which take place in the more curable forms of secondary syphilis. Ten preparations were laid on the table, exhibiting the discase in all the stages of its progress, from a small circumscribed tubercle, in an otherwise sound testis, to the contracted, indurated, and completely disorganized gland. The structure of the tubercle is rather soft, but harder than common scrofulous tumour. and surrounded by a thickened layer resembling a cyst, the product of inflammatory action. In one preparation the tubercle was in the lower part of the testis, which was otherwise so sound that the epididymis admitted of injection by mercury, while in the opposite testis the tubercle was softened, and contained a glairy fluid .- Dub. Journ., Nov. 1835.

OPERATIONS FOR S

The following statistique of operations performed at the Hospital of Incurables and of St. Mary, at Naples, during the Spring of 1835, we extract from the Gaz. Med. de: Paris. No. 44: --

The neck of the bladder was divided downwards and to one side. Professor Dr. RENZI is in the habit of publishing annually , the statistics of all the operations for stone which are publicly performed at Naples How much would be gained by science if the surgeons of our great hospitals were compelled to imitate this example, for the principal operations which they are called upon to perform! We should then have a body of authentic facts upon which confidence might be placed, and from which deductions of the highest value might be drawn.

At the Hospital of Incurables, ten operations were performed; six of the patients were below ten years of age, the others had: not reached that of puberty. In four cases the stone was large; in three it was small; in three of a moderate size. There were nine males and one female. Only one patient died of the ten; after having cut into the bladder, the surgeon was unable to extract the stone. The bladder, after death, was found much inflamed, almost gangrenous, and the mucous membrane was reduced to a kind of pulp.

At the Hospital of St. Mary, four patients were cut, and all recovered: three were below fifteen years of age.

Since the year 1821, up to the present time, 454 patients have been operated upon in these two hospitals. 439 males, 15 fer individual is involved in the inquiry, the males; or 216 children, 191 adults, and 47 modical evidence having quided the corresponding to the corresponding old. Of these there were cured 388; died 66; giving an average of one death in nearly every seven cases.

ARTIFICIAL ANUS CURED BY A NEW PROCESS.

sar, of Paris, was called on to see a child plying to the coroner for a copy of the detwo days old, who had not yet passed any positions, he declined granting one, on the meconium. The anus existed, and was well ground of the concession being illegal, formed, but the rectum terminated by an though he politely read the depositions to opening in the vagina. On examination it his distress, I am bound to carry the inquiry was found that the rectum did not exist for forward to an issue, that I may not two inches from the anus. M. AMUSSAT, volved by undertaking a defende therefore, determined on seeking the extremity of the great intestine, separating it from its attachment, and fixing it by suture to the opening in the skin; for this purpose the made a T incision between the vaginal and in bowels were much compared to the control of th

opening and the anus, and having introduced the finger by this opening, he separated the vagina from the coccyx and sacrum, until he arrived at the blind end of the great intestine, which was placed above, to the right side of the sacro-vertebral angle. Arrived at this point, the managuvres produced a desire to evacuate the meconium. The gut was recognised by Messrs. Denenx and Lebandy, who were in attendance. It was seized with a book, separated from the surrounding parts by the finger, and drawn gently down to the opening in the skin. where it was fixed with several points of suture. It is now twenty-eight days 'said M. AMPSSAT at a late meeting of the Academy of Medicine: since the operation just described has been performed, and no accident has occurred, the child being in the most satisfactory state.

INQUEST AT FARNHAM.

To the Editor of THE LANCET.

Sir, -- The details of the subjoined care will go farther to prove the necessity for the appointment of medical coroners, than any which I have yet known to be brought be-fore the public. The verdict delivered was "Accidental Poisoning," and nux vomica was the poison sworn to have caused the fatal result. The medical evidence and a general outline of the inquest I transmit for publication, well assured that the pages of THE LANCET will be open to the insertion of facts of so much general importance, especially as the character of a respectable medical evidence having guided the coroner and jury in the delivery of the charge and the verdict. No other channel offers to clear the person on whom odium is attempted to be cast (the local opportunity being bermetically scaled), and he here, therefore, bogs to challenge those opinions which can decide the question at issue. The In the month of September last, M. AMCS- details are given from memory, for on ap-

But why do I argue for a conclusion that must be inevi-dr. Possible falled to remem-table? This inferential mode of destroying

a character, is sad indeed. Had Mr. Postello been provided with a competent medical friend at the inquest, the coroner and jury, if they had believed the child to be poisoned would never have suspected Mr. Postello of the act, and that the coroner had that impression on the inquest I can positively assert. A hundred times better would it have been for Mr. Postello to have been committed for the crime of poisoning at once; he might then have cleared himself on his trial, in the minds of his townsmen, from what has excited, and is calculated now to continue to excite, distrust. But this inquest is final, and although to clear Mr. Postello every fair proposition has been made, especially that of strict inquiry by a select body of medical men, the appeal has been contemptuously rejected, and a threat of action even hinted at, if he perseveres in the demand. The coroner, Mr. Woods, is in every sense a gentleman, and was most auxious that the character of Mr. Postello should be cleared; but the only resource now is the public press; and to your journal he appeals, as to the most honest of medical periodicals. With respect to my position in the affair, Mr. Postello having thrown himself in the emergency on me, I cannot allow the facts to be smothered.

That medical knowledge in a coroner is a most essential requisite for the good both of the public and of individuals, must be too obvious from the history of this case, to need further exposition from me. I remain, Sir, your most obedient servant,

G. V. Rogers, Surg. Farnham, Surrey, Oct. 26th, 1835.

P.S. The mother was found by Mr. Bury in a state of extreme intoxication, when he first visited the child.

THE LANCET.

London, Saturday, November 14, 1835.

A FACT which is most happily characteristic of the hole-and-corner proceedings in the College of Surgeons, has just been presented to the profession in the election of a new member into the Council. We ought, in truth, to make some distinction between the two last elections, referring specifically to the first of them as furnishing the best evidence of the event to which we allude. Mr. GREEN, of St. Thomas's Hospital, was not chosen the other day by the self-perpetuating junto, but was, positively, elected

some many three, on the resignation of Mr. Lynn; and yet so secretly, so covertly, and—we may in justice, state, with reference to the great body of the members—so clandestinely, that it was not known up to this very week, to the profession in the metropolis, that Mr. Green had becor a member of the Council; and, in reality, the circumstance is now for the first time published to the profession generally.

What a state of things is this! And yet this system of secrecy has been endured by the medical community since the barbersurgeous were first erected into a corporation! Even the charter of 1800, under the authority of which these odious secret elections were conducted, was merely, in spirit and in letter, an emanation from the Act of the 18th of Gronge II. It was not, therefore, Mr. GREEN who was chosen in consequence of the vacancy which was caused by the death of Sir WILLIAM BLIZARD, but Mr. CALLAWAY, the Assistant-surgeon of Guy's Hospital. Although, therefore, we were wrong with respect to the name of the gentleman who was last week stated by us to have been elected, still, so undeviating is the College in showing its unjust and pernicious pertiality towards the surgeons who are connected with the hospitals of this metropolis, that not a little of our argument was inapplicable to the occasion. If Mr. KINGDON and hundreds of others had not been turned aside to give place to Mr. GREEN of St. Thomas's Hospital, they were made to yield to the preference which was shown for Mr. CALLAWAY of Guy's Hospilal. To such a barefaced and scandalous extent is this practice of choosing the hospital surgeons carried, to the exclusion of other gentlemen of acknowledged attainments, abilities, and industry, in the profession, that out of the twenty-one Councillors who at the present moment the College, the enormous teen are holding office

hospitals of this metro

conferring in conclude in the

students who belong to their own institute Mr. BRANSBY COOPER. Who is the assist-I tions as well as for the government of the will surgeon of that institution? Mr. Thogentlemen who are connected with the private schools. Seventeen out of the twentyone Councillors belong to the "recognised" hos, tals. What an astounding fact!

In defiance, however, of these circumstances, the members of the Council bave the effrontery to contend, that when a vacancy occurs, they elect the new member according to the seniority of his standing in the list of the commonalty. The gross and daring falsity of this assertion is evident from throwing into contrast the few hospital surgeons, with the many thousands of the medical commonalty who hold no situations in our public medical establishments. If it be a system of "seniority" or of "rote," let us see with what henesty it has worked:-

In London, and within a circle of ten ' miles around the capital, it has been calculated that there are nearly, if not quite, a thousand resident members. How happens it, then, if the rule of seniority be observed in taking the names as they stand upon the list, that a moiety of the entire body of the surgeons and assistant-surgeons of our hospitals should be scated in the Council at one time, and only four be selected from the remaining nine hundred and sixty-six members? These numerical facts are so damnatory to the electoral proceedings of the Council, that it is unnecessary to expatiate on the infamous partiality which has been shown towards particular individuals and institutions. On some occasions, it is quite evident that the names of hundreds of memers must be passed over at a single elecon, in order to reach that of an hospital argeon, and having arrived at persons onnected with their own institutions, segity is then allowed to exercise its full guiding the decisions of the

ion to the choice

their regulations for the government of the Mr. ASTON KEY, Mr. JOHN MORGAN, and MAS CALLAWAY. How many of the four occupy seats in the Council? Only one. Who is that individual? THOMAS CALLAway, the assistant surgeon. In this election, therefore, the practice of election according to seniority has been observed, Mr. CALLAWAY being the senior member of the College.

> This exposition will lead many persons to inquire, how it has happened that the three surgeons of the hospital, who are Mr. CAL-LAWAY's juniors in professional standing, occupy a higher station than himself, when it is well known that the whole four were the apprentices of the former surgeon of Guy's Hospital. Adequate information on this subject can only be furnished by our ancient friend King HAR-RISON; but it is a well-known fact that on the election of Messrs. KEY and MORGAN, a scandalous attempt was made to nullify the claims and pretensions of Mr. Callaway, and, subsequently, when Mr. B. Cooper was chosen, having served an apprenticeship there to render himself "eligible," after he had acted as an assistant-surgeon in the army, the office of assistant-surgeon in Guy's Hospital was then, for the first time, created. Mr. Callaway received it, and the emolament, it was hoped, would operate as hush-money on the mind and tongue of that gentleman. We apprehend that the wilv treasurer was successful in his project, and it is now sufficiently obvious that the scheme was by no means an unfortunate one for Mr. CALLAWAY. Had that gentleman been excluded,-had he, through the instrumentality of calumny or intrigue, been cut off permanently from all official connection with Guy's Hospital, -is there a man in the profession who will not believe that such a circumstance would have been made by the majority of the Council in Lincoln's Inn Fields, the ground-work for one of Guy's Hospital? visiting upon him a continuance of the

When the Council of th members of society, and that the literary wholly centred in Oxford and Cambridge, a national calamity. The most extreme caution, therefore, on the part of the conductors was demanded, not only in the election of professors, but in the arrangement of every circumstance which was calculated to affect the permanent interests of the es-Conneil for having endeavoured, at the opening of the institution, to present to the public a phalanx of professors who had already acquired a certain extent of reputation, and had won, by their displays of industry and talent, a considerable share of the public confidence? The concours had not been tried in England; it was not understood here; and men of intelligence and reflection will allow that the Council were warranted in not attempting to sustain the experiment of establishing the University by the institution of what was to them

the successful compe-

del minds and qualifications of the candidates clined to elect by the open system of con- are tested by appropriate measures. This cours, we were not insensible to the force of is a symbol of what is to follow. As the reasons which induced them to elect the chairs become vacant, and as the their professors in private, and under the University maintains its hold on public authority of such information, regarding the opinion, there cannot be a doubt that the car 'idates, as they were able to obtain from Council will open the professorships to the public and private sources. The University medical community, and confer the vacant was altogether a new institution; it was an effices on the most successful of the wrangexperiment on the public mind. Owing to lers. But there is a wide difference between the liberal principles on which it was sought electing gentlemen in the slow succession to be established, all the host of bigots and arising from individual vacancies in the refanatics of the day vomited forth their spective departments of an institution, and calumnies against it, and endeavoured to starting, at the very outset, with an entire overshadow the prospects of its conductors, body of unknown men, who, nevertheless, It was felt, therefore, by every person who may have obtained their offices by concours. was desirous that the spirit of the age should. In the College of Surgeons the case is he liberalized, that a knowledge of science wholly different, and nothing can be more should be more widely diffused anongst the scandalous than the system of election in that establishment, -nothing more disgracereputation of the country ought not to be ful than the absence of open competition in filling vacant seats in the Council. The that the failure of the University would be charter neither stipulates nor interdicts, relative to the elections, further than by declaring that the Councillors are always to be selected from the commonalty. In conformity, therefore, with the liberal spirit of the charter, the Council were bound by their duty to the profession and the public, to tablishment. Who, then, shall blame the select the best-informed menthey could find among the members at large, and no proof of qualification could be presented equal to that which is derived from an exhibition in a concours. In neglecting such a fair and open trial for competitors, the Council have degraded the character of the institution: and, further, as the executive governors of a College of Surgeons, they have long forfeited every claim to the slightest share of the public confidence.

INSTEAD of furnishing proof of the truth experiment, the concours. But the of his base and slanderons allegation against netition has commenced, the the Editor of this journal, Mr. DERMOTT has confers the office of forwarded to us five folio pages of what he calls an "explanation." That part of his Chamination, where the communication which refers to the accusation that was so distinctly made in his paper in the Morning Advertiser, we here inserts verbatim:—

" But to the point at issue, I certainly did make use of the following words- Besides, ' Dr. Plausable had now by these means (his conversaziones) extended and improved
 his connections vastly amongst the governors of a neighbouring hospital, a vacancy for a physician occurred and I need hardly state that his parties ensured him ' success. He now sends occasional letters ' to THE LANCET, which it is scarcely necessary to state are always inserted and "well displayed." For let me tell you, gentlemen, that it is very seldom indeed, unless under ' some most peculiar circumstances, that a persons " communication" is refused provided he has plenty of the essential heavy metal.* This is a very weighty reason with many Editors; provided too the com-' municant drives his carriage, keeps a good establishment and is therefore considered as a most respectable and influential member of society. In a just state of society, &c.'

"Looking at the paragraph, at what precedes it, and what follows, as reported in the Morning Advertiser, it will be seen, in the first place, that I was speaking of the evit tendency of money upon society in general and stretch the signification as much as yon please, you cannot therein show that I literally state that you have taken a bribe direct."

As George Darby Dermott has here made a clear and distinct confession of his guilt, we leave him to eschew the happy consequences of his own malignity and folly.

A word to the Editor of the Morning Advertiser. On the 20th of July last, the annual "Cartwright Dinner" was held at the Highbury-Barn Tavern, Islington, Mr. WAKLEY in the Chair. On the following morning a few sentences of a report of the proceedings at the dinner were published in the Morning Advertiser. It was therein stated, as a part of a speech made by Mr. WAKLEY, that he had said in his notice of the public press, "that the Morning Advertiser newspaper had neither scope, space, "nor talent, to espouse the cause of the peo-"ple efficiently."

of the paper there auseared an editorial comment, in which Mr. WAKLEY was called upon, under a threat, to explain whether he had or had not used these words. The threat was, of course, regarded by Mr. WAKLEY as an invocation to silence. Had there been no menace, he would most cheerfully have stated that he did not utter one word or syllable injurious to the character of the Morning Advertiser. On the contrary, he most distinctly and unequivocally declared that of all the morning papers the Morning Advertiser advocated, on the broadest and most liberal basis, the rights of the mass of the people. In fact, the editor of the Advertiser was imposed upon, on that occasion, by a tissue of infamous falsehoods. Mr. BARCLAY, late candidate for the representation of York, and other gentlemen, addressed letters to the Advertiser, showing the inaccuracy of the statements in the report, and the Editor of the True San, who was at the dinner, gave a report of the proceedings at variance with that which appeared in the Morning Adrerliser, that gentleman even offered his own personal testimony in proof of the fallacy of the calumnious statement. But there was one person who wrote to the Advertiser. affirming the accuracy of the words which had, in the first instance, been attributed to Mr. WARLEY. That person was George DARBY DERMOTT, whose feelings towards THE LANCET have, for some time past, been those of bitter comity, from his entertaining an opinion that his labours, as an author and a draftsman, were slighted by that journal. This was the witness.

journal. This was the witness.

The editor of the Morning Advertiser ought now to be convinced that he acted very harshly, if not unjustly, towards Mr. Wakkey on that occasion. But it is quite true that a reformer, or the conductor of a journal, who pursues his course honestly and independently, cannot, by any possible false imputations; but, if he his course in utter defined all ander, the laborations of as we to the product.

These words were printed in Italics in the Morning Advertiser. - Ev. L.

In publishing the letter the present number of THE LANCET, giving an account of an inquest which has recently been held at Farnham, we should violate our own sense of justice and propriety, if were to refrain from stating that Mr. Postello does not appear to have incurred the slightest degree of culpability in connection with the decease of the child. In short, there is not a tittle of evidence in proof that the child was poisoned. Certainly the powder which was administered on the Sunday morning, was not the cause of death by poisoning on the following Thursday, and was assuredly not that which was found in the stomach of the deceased at the nostmartem examination on the following day. Mr. Postello is entirely exonerated from blame, and it is an act of malicious cruelty to make him the object of suspicion or reproach on an occasion in which his conduct is wholly blameless.

CREOSOTE is now enjoying in London the vogue which it possessed one or two years ago in Paris, and, at an carlier period than that, in Germany. The various experiments made with this new remedy, and the different opinions prevailing with regard to its medicinal powers, induced the Royal Academy of Medicine in Paris to appoint a commission of its members, with a view of examining the several memoirs addressed to the Academy on this subject, and of performing for themselves experiments with this highly extolled substance. These trials have been concluded, and in a report on the therapentic properties of creosote, made by M. MAR-TIN SOLON, on the 6th of October last, on behalf of the commission, it is stated that they do not at all confirm the character for success given to it by most of the authors who have written upon creosote. The coman, therefore, are inclined to believe, peutic powers have been very but their investigations

> scovery of its use for the anatomical preparations.

portion of epiploon, a por-

is like i placed in a jar containing a weak solution GERS, which will be found at page 256 creosote, in order to test its quality in this respect. The jar remained in the aniphitheatre of the Hopital Beaujon, from the month of August last until the presentation of the report, when the preparations were still in a state sufficiently good to give an exact idea of the organs themselves, and the lesions by which they were affected. The commission concludes by stating, "that creosote, a substance very remarkable in a chemical point of view, has a peculiar action on albumine, which it congulates very quickly; that it has an exciting action on the economy, but is not more efficacious than other means which we already possess : and, finally, that, dissolved in water, it may serve for the preservation of anatomical preparations.'

> On the report being read, M. ANDRAL junior remarked, that he had made numerous experiments with creosote, without ohtaining satisfactory results. He said he had tried it in pulmonary phthisis, in cancer of the uterus, and in the various forms of leucorrhess. In eighteen cases of pulmonary consumption, neither the cough, nor the diarrhora, nor any other of the symptoms, was alleviated by its use. In cancer of the uterus, when used in the form of injection, it acted simply like any other astringent. M. EMERY, in addition to this, said that he had employed this substance in various cutaneous affections, and generally with the effect of exasperating the disease. M. VEL-PEAC also spoke on the subject, and stated that he had tried it two years ago as an external application to cancerous, scrofulous, and syphilitic ulcers. He observed that he regarded creosote as an excitant. and even as slightly caustic, but he considers the nitrates of silver, of mercury, and some other such substances, as much superior in remedial efficacy. Some of our medical brethren on this side of the channel. hold a very different faith from the general creed of the French commission.

DUPUYTREN'S MUSEUM.

THIS museum, which with much greater propriety might have borne the name of ORFILA than that of the great surgeon whose bust is placed over the entrance, was maratlana, were thrown open to the public on the 2nd day of

this month. It occupies the small gothic church which was formerly attached to the old convent des Cordeliers, which, like so many other buildings in France, has passed from the service of the church to that of the state. It seems strange enough, as one of our contemporaries has observed, that visitors should enter a museum of anatomy through the door of a Catholic church, but anomalies of this kind are so frequent in France, that the morale of the circumstance does not seem to affect or disquiet even the most steady advocates of "the present order of things." In fact, we know not where a better study of a true creed could be found, than among such exquisite evidences formation. Here, indeed, men have "reation of the Society this evening sons for the faith that is within them." We shall defer anything like a detailed description of this establishment, until a catalogue is published, and the presses are somewhat better garnished. The creation of a few Tile decease of this gentleman was an entropolitan physician. months, "Dapuytren's Museum" is, of nounced by Dr. James Johnson, in the subcourse, at present very incomplete. It con-by remarks from several members, occurtains, however, already, about 1500 prepara-ring in the order in which we now proceed tions, which are labelled with care, and to report them. arranged in a manner well calculated to facilitate their study. The greater part of had occurred within the last few days in a of the Faculty, and are highly interesting, as numbers of them refer to the "Memoirs" of speak, as were many of the qualities which the old Academy of Surgery; the rest have would render his loss severely felt. been prepared by the young anatomists of facility with which he communicated his the school. The establishment of the mu-ideas, the fertility of his imagination, the seum reflects the highest credit on the zeal brilliancy of his wit, and the poignancy of and perseverance of M. ORFILA, to whose exertions alone the medical public of Paris are indebted for an opportunity of studying good-nature was cager to heal. On Tuesthe various morbid alterations to which the human body is subject, in the most complete manner. Should the zeal of the dean be seconded, even feebly, by the different hospital surgeons or physicians, the Music Dupuytren may soon hope to rival or surpass any similar establishment in Europe.

HUPELAND'S ELIXIR.

Formula for a very efficacious Anti-catarrhal Elixir .- In the obstinate and frequently distressing cough which remains after the influenza, as well as in other chronic and catarrhal coughs, the celebrated German physician HUFELAND has found the following mixture of the greatest benefit :--

Extract. Card. Bened. 5j; Dulcamar. 9); Aque Fenic. 3); Lauroceras 5), M. 60 drops four times a-day. Under the lauroceras of this mixture the cough diminishes in a few days and disappears. The author has also found it useful at the beginning of consumptive cough, supervening on common catarrh.

WESTMINSTER MEDICAL SOCIETY.

Dr. Apprson in the Chair.

DEATH OF SIR D. BARRY.

Amongst other subjects which engaged

Dr. Johnson said the death of Dr. Barry his satice, were all equally remembered; though he might add, with regard to the latter, that whomsoever he wounded his day last, Sir David dined out in perfect health. After dinner he ate three pears and some nuts, and in the evening some cake. which he did not relish; afterwards he felt an uncomfortable weight about the chest. On the following day, on his way to the city, through the Haymarket, he was suddenly seized with excraciating pain in the stomach and loins, and faintness, and felt assured that he was dying. He (Dr. J.) was sent for, but being from home, his son attended, who found Sir David pale, chilly, and with the aspect of a person who had sustained a severe accident. Sir David was conveyed home, and at one ping, same day he was visited by

when he was still chilly, action had commenced bad, and was beginning toped. Sir David considered the sence of indigestible matter, and L) denurred to prescribe this but Sir David primers after Sir David's death, he hesiurged its administration. Hereby, J reasoned with his patienties the tripect, point ing out that as the indigestible substance blanched, and that it was impossible by had been swallowed fifteen or sixteen hours since, without doubt it had passed the pylo- them with blood; the same phenomenon ric orifice of the stomach, and that an eme-tic would occasion considerable pain and dicating death from hemorrhage, therefore inconvenience. He therefore wished to nothing was attempted at this period to be prescribe four grains of caloniel, and one of done in the way of treatment. opinm. To this Sir David acceded, and he was directed to be kept warm in bed, and whether there was any valvular disease to have hot cloths applied to the stomach. existing. (The answer was in the negative.) At his next visit, two hours afterwards, he found his patient relieved, and more coming the (Mr. S.'s) father had died from sympposed, his skin was warm and moist. A warm toms very similar to those affecting Sir aperient was prescribed, and as it had not David, and in his case valvular disease exsufficiently operated at eight p.m., an enema isted, and was recognizable during life, was injected, which produced copious evacuation for the resided at Claphani, and retired tions. Between the time of prescribing the to-bed one day as well as usual; presently aperient and administering the injection, after he was heard to fall on the floor; on Sir David felt better; his pulse had become being found and placed in bed, he could not better, and no symptom was present, indi- articulate; the pulse of each wrist was differcating that his end was so near; nor did Dr. ent in its beat from that of its fellow. He Copland, who saw him, consider his life to (Mr.S.) arrived at seven p.m., at about four be in danger at half-past ten p.m., he re- hours and a half from the attack; the power mained quiet until one p.m., when suddenly of atterance was still absent, but the patient he expired, after getting out of bed. He was evidently conscious. At midnight he was in the fifty-sixth year of his age. The died suddenly, apparently while awaking post-mortem examination was performed on from a quiet sleep. On the following day the following Friday evening by Mr. H. the body was examined, when no dis ase Johnson. On laying open the abdominal was discovered in the abdomen; but in the coverings, remarkable layers of fat were ichest, one to two pounds weight of clotted found between them and the peritoneum; blood was seen, and a large quantity of blood the stomach and intestines were empty, had made its way into the posterior medias- and exhibited no traces of disease. On timum. making an incision into the right side of. Mr. H. Johnson offered to describe the the fatal result.

would be removed by an emeter Level present. When he (Dr. C.) arrived, a few

Mr. STREETER inquired of Dr. Johnson

the chest, an immense quantity of clear condition of Sir David when he first saw serum burst forth, but he Dr. J. was not him. He found him sitting with his hand a little astonished at finding the left side of on the epigastrium, the seat of agonizing the chest filled with water, and five pints of suffering. Sir David at once argently re-blood effused into the cavity of the chest, quested that an emetic should be adminisan ancurysm of the descending thoracies tered, but with this request he did not comnorta being discovered, of the size of an ply; an opinion against it also was mainorange, which had burst into the posterior tained by his seniors on their attending, the mediastinum. The left ventricle of the impropriety of the step being also since heart was hypertrophicd, and found to be sanctioned by the ascertained condition of upwards of an inch in thickness. On re-the sufferer. He was then cold, the lips fleeting on the matter, now that Sir David's; were blue, the pulse was small, the countesufferings and the cause of his death were nance portrayed intense anxiety and sufferascertained, he (Dr. J.) was extremely glad; ing. and Sir David felt convinced that he that he had insisted on the impropriety of should die. The morbid appearances were using an emetic, for had it been taken, those detailed by Dr. Johnson. He (Mr.J.) death must evidently have occurred during believed that anonysm of the thoracic aorta its action; and if an examination had not was extremely difficult to detect, and that been permitted, it would have been ex even the most claborate medical inquirers tremely difficult to account satisfactorily for had admitted that fact. Dr. Green, it atal result.

Was true, had, in an able article in the COPLAND said that he had but little Dublin Journal, arrived at the conclusion particulars. When he was that the morbid condition could be predid Sir David still expressing cated, yet the indications amounted in his Lan emetic, but not con- opinion to little more than a series of guesshe required he (Dr. C.) ings. In rupture of the aorta into the is presulting on him to wait until pericardium, it was not generally considered addition at eight p.m., when Dr. that death must necessarily follow immeand Mr. M'intyre would also be diately after the accident, and in Sir D.wid Barry's case, several hours had elapsed between the accident and the termination of life.

Dr. CHOWNE said he was aware that Sir David Barry was impressed with the idea that he laboured under an affection of the heart. Was Sir David of the same opinion during the present attack?

Dr. Johnson replied that about four years ago Sir David called on him, and requested that he would examine his chest with the stethoscope, as he (Sir David) feared that his heart was affected; but at that time no disease could be detected, although it was not impossible that the hypertrophied condition of the right ventricle had already commenced. As Sir David was inclined to be stout, and one who might justly be termed a bon-rirant, though not irregular in his habits, he (Dr. J.) recontmended him to live rather more abstemiously. The circumstances of the sudden death of a Dr. B .-- were recalled to his mind on the present occasion. The doctor was rather an invalid, and he (Dr. J.) called to see bim in the evening, when he found him taking his wine. He (Dr. J.) sat with him for about half an hour, when, all at once, without any evident cause, Dr. B. complained of pain in the head and stomach, and turned pale. Presuming that the the stomach and back with increased inof blood was found effused from the rapture from its employment. of an aneurysm, which no doubt burst when he (Dr. J.) was first sitting with him, and the faintness induced, arrested the hemorrhage, but at last the gush was too large to be thus checked, and death followed.

Mr. Costello related the case of a young gentleman who was brought into the Hotel Dieu, under the care of Dupaytren; who had, while fencing, the point of a dagger thrust through the pericardium, which corroborated the opinion, and in great measure served to lay the dispute that had long existed, whether such injuries were fatal or not. Dupuytren maintained that they were not always followed immediately by death.

A few other remarks followed, and then the subject dropped. The other discussions of the evening, as well as those of some other societies, shall find a place in our next number.

THE Medico Chirurgical Society held its first meeting for the present session, on Tuesday evening last. A report of the proceedings shall be given in the next LANCET. MEDICO-BOTANICAL SOCIET 1.

ar 10th, 1835.

EARL STANHOPE, President, in the Chair.

THIS being the first night of the session, on the President taking the Chair, an ... !dress of congratulation on his return to England after a long absence was read. lordship, in returning thanks, ascared the Society that he felt most anxious for its success, and that he should devote much of his time to promote its welfare, both from his love for botanical science, and from the great respect he felt for the medical profession.

Dr. Sigmond then read an eulogium on the late Mr. Gilbert Burnett, which was ordered to be entered on the minutes of the Society.

Mr. Jounson read an address introductory to the opening of the session, pointing out the advantages which had resulted from the study of botany, by contrasting the present objects parsued in medical education

with its state many years since.

A paper by M. Gramon was next read, on the application of the juice of the Manchineel tree in cancerous diseases. The doctor was fainting, he administered some remedy is to be brought into contact with brandy and water, which presently revived the esther alone; care being taken to pre-him, but, shortly after, the pain returned in cent its absorption at the edges, from which vert its absorption at the edges, from which the worst effects might follow. Its analogy tensity, and in a few hours after he died, to the action of arsenic induced M. G. to At the examination, a considerable quantity recommend the juice, and anticipate success

LONDON MEDICAL SOCIETY.

OBSERVATIONS BY DR. RAMSBOTHAM, ON EXTRA - UTERINE PETATIONS, AND ON THE TERMINATIONS OF THE CIERING VESSELS, IN CONNECTION WITH THE PLACENTA.

To the Editor of THE LANCET.

SIR, -- As you have noticed in the last number of your journal some remarks 1 made at the London Medical Society on a case of extra-aterine conception. I shall feel obliged by your correcting the following triffing inaccuracies into which your reporter has fallen.

I stated, -- not that there were corded five cases of extra-uterly but that I was only acqu reported in our language nterine fætus had been t that none of those cases had a Britain. The earliest is given by M

of Negis, W. I. (Fig. June 1697.) Mr. Bard of New York has. Jurnished one. (Med. Obs. and Jug. vol. 2, March 1760.) So bands. Dublin. (Med. Commentaries, vol. 2, part 1, 1774); in which instance the gestation was twin; and both fectuses were removed at the same time. We have another by Dr. M'Knight of I aw York. (Mem. Med. Soc. Lond. vol. 4); and a fifth by Mr. Baynham, Essex County Virginia. (Med. Facts and Obs. vol. 1,1791.) I might have added a sixth, which at that time escaped my recollection. (Philosoph. Trans. vol. 41, 1741), in which a butcher, named O'Neil, in the County Tvrone, Ireland, extracted by incision a feetus, whose elbow appeared through an ulcerated aperture in the abdominal parietes.

I mentioned also, as your reporter states, that I had personally known ten cases of extra uterine conception, besides the one! affirm what could not possibly happen, you will allow me also to correct him here. Four of the patients died from rupture of the sac, presume that Dr. Lee's opinion at the time as evidenced by dissection; three of these they were published was, that the aterine were tubal -- the most frequent form of all vessels, in connection with the placenta, the varieties, -- and the other parietal, or as terminated by open extremities. I am, Sir, the French call it, " interstitial," -- in which ! the ovum is lodged within that portion of the fallopian tube which traverses the parietes of the nterus. Three women died during the process of alceration, established for the purpose of getting rid of the putrid mass; and three have recovered, -two after the evacuation of the fortal body, piecemeal, per rection; and the last, who had the factus remaining within her when I last saw her having conceived about 20 years ago', and who has, to my knewledge borne three children since she h come the subject of this irregular species of gestation.

In noticing my remarks also on Dr. Lee's description of the connection between the uterus and placenta, your reporter asks in the apertures [described in the ateriue] vessels in communication with the placental are at their extremities?" It is true that Dr. Lee does not use the word "extremities," but in his paper on the connection between the nterus and placenta, published in the Philosophical Transactions, and reprinted in his essay on some of the diseases of women, we read (p. 203), "The semilunar or valvular-like edges of the vessels at their terminations in the inner surface of the uterus, are admirably adapted to ensure the effects of arresting the current "&c.; and in the letter from Mr. College of Surgeons, to him, has inserted in that paper is we may therefore fairly copts) we find the follow-every instance, the reached the inner surface of terminated in an onen month on

that aspect." "But with respect to the yolns, they invariably presented the same appearances, terminating in open semiciroflar orifices, which are closed by the apposition of the deciduous membrane, and placenta." Again: "The preparation which accompanies this letter shows the termination of a vein on the inner surface of the nterns, and an artery of the decidua cut through, with the corresponding appearances on the surface of the placenta

Dr. Nimmo's report, also embodied by Dr. Lee in his paper, is to the same effect. "These (uterine vessels), instead of passing directly into the placenta, are distinctly seen applying their open mouths to the membrane of the placenta;" and Dr. Lee himself states that "Mr. Broughton (after having re-examined the preparations on which Dr. Nimmo had previously made his observa-tions authorized him (Dr. Lee) to state to under consideration; but as he has made me the Royel Society that Dr. Nimmo's account was perfectly correct."

I think, from these quotations, we may your obedient servant,

FRANCIS II. RAMSBOTHAM. New Broad-street, Nov. 11, 1835.

COUNCILSHIP IN THE COLLEGE.

To the Editor of THE LANCET.

Sir, - Let Mr. Kingdon take all the benefit he desires from his "appeal" to the profession. "What's he to Hecuba, or Hecuba to him?" The Council of the College of Surgeons dishonestly exercise the power which they wield ;-to share this power Mr. a note, "Where does Dr. Lee state that Kingdon aspires, and bases his claim on the same pretensions as have been advanced and acted upon by all successful candidates for the usurpation, and he now grumbles that he is denied the power of riding roughshod over his fellow members, and demands their sympathy that the power is refused him! The members of the College have not shown all the spirit which their declarations in 1826 justified us to expect; but they surely will not weep with Mr. Kingdon, he having sought for office by recognising the unworthy principle which excludes from the Council the very men whose support he now supplicates. Let this gentleman show cause for the inconsistency which thus marks his conduct. I am, Sir, yours respectfully,

A MEMBER OF THE COLLEGE.

19. Had a rigor in the night, which lasted occasionally been up and walking about the 11. Aspect improved, though her counte- ward, and then relapsing into the same denance is flushed; had no sleep; blister rose pressed state; but under the influence of well; stimuli administered every hour as be-imedical treatment in watching and minisfore, to prevent sinking; pulse 120, still very tering to her various symptoms as soon as feeble; tongue moist, furred, red at the tip they became evident, she continued to and sides. Three watery stools were passed, linger on, though spending a miserable existence, until the 12th of September, when death terminated her protracted sufferings.

Examination twenty-four hours post mortem.

The following phenomena were observed:-Head. Contents of the craning quite healthy. Thorax. The pleara were adherent; no serum could be discovered in either cavity; the lungs contained an unusual quantity of serum, and their texture was large and easily torn. The posterior portion of the inferior lobe was greatly congested. A quantity of fat was observed at the base of the heart, and about the origin of the larger vessels. Two ounces of straw-coloured fluid were detected in the bag of the pericardium. -Abdomen. The peritoneum was perfectly natural. The nucous membrane of the stomach was red with blood, but no ecchy-mosis was discerned. The small opening of the stomach was contracted. The duodenum was deeply injected; there were some circumscribed patches of vascularity in the small intestines, but not a vestige of ulceration nor any enlargement of any of the mucous glands was to be discovered. The inconfined; tongue covered with a white | ferior portion of the small intestines was of a deep-red colour; the cæcum and the commencement of the colon were of the colour of soot, dependent solely on the mucous membrane, which appearance was entirely removed on the separation of that tissue. The liver was mottled, and easily lacerated; the remaining viscers evidenced not the slightest appearance of diseased action having at any time disturbed their function.

venter of the left scapula, projecting about socket. Repeated applications of leeches purges, but as no benefit resulted from this 3rd of October he was conveyed into the marked that a fracture of the neck of the eased part, by an incision about seven inches sidered to be an interesting one, because it in length, along the base of the scapula, was attended with some symptoms resemwhich exposed the insertions of the muscles, bling those of dislocation of the humerus into that portion of the bone. These were downwards. The arm sinks, the shoulder then divided along the line of the first in- drops, the deltoid is flattened, and the elbow cision, and the tumour exposed. It ex- lowered. But the humerus can be readily tended forwards below the blade hone and the ribs. The operator then dissected location. The ellow is not drawn away round it, beginning on the surface which from the side, as in a dislocation, and the confronted the ribs, in which part it was humerus, after being raised, falls again on found to have advanced very considerably, and it was separated only with great difficulty follows the scapula, partly by the scalpel, and in part by the finger. The difficulty follows the finger to the coracoid process. which existed in this part of the operation. originated from the circumstance that very close contact subsisted between the tumour FROM THE BREAST.—Ann Price, a married and the bone, which at one part was de-woman, aged 36, was admitted, Oct. 22nd, nuded of its periosteum and rough. On the under the care of Mr. Cooper, with a turemoval of the tumour a very considerable mour situated below the left mammary cavity was exposed to view, the walls of gland, and towards the edge of the nectoral which exhibited the appearance of a large, muscle. It began to form six or seven which exhibited the appearance of a large, indiced. It began to folia six of seven thickened, whitish cyst. The wound was years ago, when of course her age was not slightly dressed, and slight pressure was employed on the scapula. The tumour was afterwards examined in the library, and its nature determined by Mr. Kiranan to be clines usually prescribed is fibro-albuminous. The case is doing well.

NORTH LONDON HOSPITAL.

CONCURSION OF THE BRAIN. -- FRACTURE OF THE NECK OF THE SCAPULA .- Jame Ricketts, aged 44, was admitted, Oct. 2 under the care of Mr. Cooper, in conse quence of a fall while painting the roof of a lofty room. The pupils were dilated, hi pulse was slow, and he was affected with FIBRO-ALBUMINOUS TUMOUR OF THE bleeding his pulse rose. On being brough BACK.—OPERATION.—James Jackson, witat. to the hospital he was partially insensible 55, was admitted under the care of Mr. but could be roused by questions put to Earle, on the 10th of September, with a bim in a loud tone of voice. The iri tumour which had existed about fourteen acted on exposure to light. Pulse 120 months, and occupied the hollow of the The head was kept in an elevated position and a cold spirituous lotion was applied to two inches beyond its base towards the the scalp; his bowels were opened with spine, where it exhibited itself in the form calonel and croton oil, followed by a mix calomel and croton oil, followed by a mix of a deep rounded swelling. He complained ture containing the liquor ammonia acetatis of an uneasiness from its existence, though sulphate of magnesia, and antimony wine the actual pain which he suffered was but On examination the neck of the acapult trifling. He could draw his arm forwards on was found to be fractured, - a kind of injury the chest, and backwards towards the spine, Mr. Cooper remarked, which was very without difficulty, and he possessed the casily detected through the medium of the entire power of rotation of the arm in its coracoid process. The arm was put up coracoid process. The arm was put up had been employed, with cold lotions and the elbow being at the same time well supported in a sling. This case went on very treatment, it was deemed requisite by Mr. favourably; the patient recovered the ful EARLE and his colleagues to remove the power of moving his tongue, and left the hosdisease by operation. Accordingly on the pital at his own request. Mr. Cooper retheatre and secured on the table, when Mr. scapula generally occurs through the notel EARLE commenced the excision of the dis- in its superior costs. The case he con-

CLINICAL LEGIURE

ON CASES OF

DEFORMITY OF THE SPINE, PAINS IN THE HEAD, NECESTICE PAIN OF THE ATOMACK, AND COLE A PICTONUM.

Delicered in the Syssiem 1834-36.

By DR. ELLIOTSON.

The first case I shall notice to day, gentles within that distance she could move them men, is one of deformity of the spine, partly with the greatest readiness. Her comresulting from weakness, and partly from plexion was improving. On the 1st of Sepstrumous disease. The patient was a girl, tember she was much stronger, and her aged ten years, admitted on the 27th of complexion absolutely florid. Her appetite July. The account obtained from her was, was good, and she could now walk alone, that she had had a curvature of the spine as though she was unable to support herself long as she could remember. About eight en upright on her feet. This is an instance of months ago she began to complain of shoot- the great benefit that may be derived in cases ing pains in the right foot and leg, and soon of curvature of the spine from debility, by afterwards in the left. These were graduathe use of tonic measures, and, among those, ally followed by partial loss of motion and certainly iron and the cold-bath rank the complete less of scusation. She also last first. Had the disease not lasted so long, the power of retaining her urine and feces, and the curvature not been so great, and About a year ago she was admitted into \$4. bad there not been, also, scrofulous disease Bartholomea's Hospital, under the care of of some of the vertebra, extension might Mr. LAWRENCE, where she remained four , have been proper, but in this case I conmonths, and during that time had two ceive it would have been useless. issues formed on each side of the dorsal part of the spine. She improved very much delighted lately, when visiting Paris, to see while in the Hospital, and when she left had the beautiful plan of treatment adopted in regained the power of retaining her urine an Orthopedic Institution. I visited that of and foces, and perfect sentation in the lower. Dr. Bouvier, and of all the things that extremitles, but she is still mable to use I visited belonging to the medical departher legs for support or motion. In other ments of Paris, nothing gratified me more; respects her heal h is good,

he could remember. The disease of the various descriptions in the establishment, No. 634.

No. of Address of State Control of the Control of t NORTH-LONDON HOSPITAL, by Mr. Lawrei Nor. To have attempted in restoration of her shape would have been finition but there was an evident indication that improvement of her strength should be attempted, and for this purpose I ordered a cold shower-bath daily, and half a drachm of carborate of iron three times a day.

On the 11th of August she had become considerably strengthened, her complexion was even rather florid, her appetite was good, and on the 15th the dose of carbonate of iron was increased to a drachm. On the 25th she could move her legs freely, ; although only through a limited space. She DEFORMITY OF THE SPINI -- Toxics -- lower extremities beyond a small angle, but

> I may mention here that I was greatly little, indeed, gratified me so much-

On her admission here she was in a state. The pian adopted by this gentleman, of extreme weakness, and there were other and, I presume, by others, who have similar types of the same beyond what the institutions in that empiral, is two-fold,—that the four-values appeared to be that of restoring the misshapen parts as far as possible to their proper form. For the located parts of the former to the forme of the holy erect. It was this curva- the former purpose the patients are sup-which appears to have existed ever plied with proper food, there are baths of and the persons under treatment exercise leasing this position for the purpose of gymnas much as possible in the open air. The lattice climates three times a day, it is not hours of exercise recur three times a day, it is not likes in weather which is had, it takes place in the grounds belonging to the spirits. The improvement which was elimatitution. Tonic medicines were also fected by this mode of treatment, was manimanner. They practise a considerable numwith pleasure. The patients pass from our while hanging on the ladder, in ascending a shipout man who as original meand descending, tends to bring the spininto a straight direction. Then they do with their faces upon a sort of chair, which is means of their hands a use. I cannot detail: the number of about contrivances, a. designsitself principally by its own weight. The patients are mover answed to rest upon then of the crutch. As they pass from one gyme and way on a salivated, from which she nastic contrivance to another, they have gamed relief, but for a short time only. these cruckes ever with them, so that they I I was quite certain that antiphiogistic never test for a connect on their feet, by treatment would not care this patient. The cause while proving from one apparatus to antiphiograph treatment had been fully emanother, while they use the crutches, there played, and tron her paleness and the intoes only touch the general. Then their orbitancy of previous antiplifiguous treatgrienasti exercises, which are quite a deciment, it appears it is one that the cubilities light to them, are never continued long at u of non-un-likely to be of great bettell a time, and the smould be fatigued. The passion. There are a number of cases tients practice to in three times a day, and in the head which yield to the repose upon their backs I think for eighteen are a and not to antiphiograf hours out of the swenty-four; and while in are cases in which, so repose there is a moderate degree of extensions, there is palences, deline sion kept up. They go on with their city and featherest of pulse. The palentes while in this position, and from their featherest have might arise from

given, and I took the opportunity of point-fested by the casts which had been taken of ing out to M. Bouvien, as I did to M. several young ladies, at the time of their Li cor, the great advantage that would admission, and at the time of their leafing arise from the employment of very con- the institution. Many had been quite cured, siderable doses of the carbonate of iron, and many who had been greatly distorted With the utmost liberality be assured me he were now comparatively but little deformed would exhibit it in these diseases, for the In fact, a friend of mine who accompanied purpose of ascertaining the superiority of me, with some other English medical men. full doses. The other in lication, that of remuct a young lady there with whom he was storing the deformed parts to their proper acquainted, and he was quite astonished at shape, is effected in the most agreeable the improvement which had been made. The gentleman who superintended the estaber of gymnastic exercises, all of which blishment. CLINICAL LECTURE

ON

EPULIS.

WITH REMARKS ON OPERATIONS IN GENERAL.

Delivered, Nur. 3rd, 1835.

By SIR BENJAMIN BRODIE.

and then, for the first time, she left a tu-ject though his account occupies perhap-nour occuping the place of the best teeth, two-thirds of one of his quarto pages. I apparently rising from the alterdar process, have backed to other books, but I can find It was at that time firmly bound with the no history of it there; and, consequently, ened by the hetaorrhage." Thus runs the correct account of its character. report, which proceeds to say: - "At the: This disease, according to my experience, present time," that is previous to the opera-occurs generally in women. Why it should toon where I have performed, "the uniform of so I do not know, netture can I ten occupies about one-third of the left side of whether it is accidental or not. I think it the lower jaw. It is firmly attached by a hardly can be accidental, for during the broad base to the bone. It is abserted on nonly years that I have been in hospital the surface; covered as it were with a memprocation, and during the shorter number of brane, something similar to that of the gam." years that I have had a large private practice, was no discharge from it when she liee, it is improbable that I should have came to the lospital, and it gave her no seen it much more frequently in women than actually died. When she was admitted into men. the hospital the timour was hard, as it the greater part consisted of bony matter; but stage, it appears as if a part of the gum when I questioned her on the subject, she were more prominent than the rest; the said that in the first instance it was of soft prominent part is covered by a membrane consistence. The tumour in some respects, like the gum, and when cut into, it is not as I will explain to you presently, defices very different in appearance from the confrom many of the tumours which go under sistence and structure of the gum itself; at

the time of Hippocraves, you might suppose that the disease was well understood, and that, at any rate, you would find a good account of it in some writer or other. However, I have looked in vain in books for a history of the disease, or the mode of treatment accessary for its cure, to which I could refer you, and find that there really is none. [I broked into Mr. SAMUID, COUPER's Dietionary of Surgery, because that gentleman havtaken great pains to collect whatever has been said on succical subjects, and I think that if there had been a good description of the disease, he would have found it out. But his account is this: - "Epulis, a small GENTLEMEN.—I will read to you the hiss toberome concerns. The hest plan of cure is tory of a case in which I have been opera- treatirpare it with a knife." I then thought ting. The patient, who is now farty years that I would look into an other authority, of age, "has fuch," as she states, "had and turned to Hislor's "Surgery," pubteeth for omice years. Four or two years its hed more than a century ago. He says ago she suffered very touch from what she that "cpub are mild, and not cancerous; considers to have been touthache, after they may be removed by ligature, by caustic, which two of the back teeth of the lower and by the actual cautery." This is the few became very loose, and drepped out, substance of what he has to say on the subjaw to her face; it progressively increased in order to give you the history, I must refer in size, and at times since has given her a to cases which I have seen myself. I have great deal of pain, occasionally bleeding so seen a great many instances of the disease, much that she has been considerably weak. and I dare say that I can furnish you with a

tion which I have performed, "the tumour do so I do not know, neither can I tell pain. She said that her grandfather had a in men, unless women really were nost subtumour of the same kind, from which he ject to it. Nevertheless I have seen it in

When you look at the disease in its early the name of "epulis," but, nevertheless, I least, so far as the eye can discern. On believe it to be one of the same kind.

these accounts, as it looks like the gam on lieve it to be one of the same kind. These accounts, as it looks like the gum on In order that you may fully understand the sorface, as it cuts like the gum, and as In order that you may fully understand the surface, as it cuts like the gum, and as this case, I propose to give you the history it is connected with the gum, so it is supported this disease. I use the word "epoclis,"— posed generally to have its origin in the surface of pronouncing the name, source in some instances; but yet I must not that the disease with a lated so long that it is lower that in cases which I have had an opported that the disease originated in the alveolar photosist, because it is derived from the processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes are the control of the latest that it is defined to the processes or the observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes. I have observed that the disease originated in the alveolar processes.

socket as the disease advances. The lister of the present patient tends to confirm this opinion, for she says that the teeth became toose and dropped out, and then up grew the tacked, or, perhaps, in some distant organisation. tumour. Here is a specimen presenting it) of the body. If you remove fungous harms of the disease, attached to the jaw, and in todes from the breast or leg, the patien which it evidently appeared to have originated in the alveolar process. In the operation, I removed with the tumour the nortion of jaw belonging to it; and I found in that the patient may die of disease again return part of the jaw which was sawn through ling in that part, or of disease in the lung and where it was not supposed that any the liver, or the sterns. But epulis is no tumour existed, that there was a substance like malignant disease in this respect; i exactly like the tumour itself, in the alveolar does not arise out of any vice in the constiprocess. I sawed through the bone where potion, but is altogether a local malady. You I thought it was healthy, and there I found may remove a cancer from the breast, an the socket of an alveolus, in which the take away the sound parts beyond it, to structure was so exactly like that of the considerable distance, and yet the disease large tumour, that I thought it right to de- will return. You may take away the ti stroy this part. The tumour is at first mour in epulis, assuring yourself that yo small; as it advances the teeth drop out, take away the whole of it, and then it doe and the tumour as last extends from out instruction. When the tumour has attained side of the jaw to the other. If the disease | very large size, it often may return after the go on it will ulcerate and increase in size, operation, because it is then difficult to go and although in this woman it remained sta- out the whole of the disease; but if the ti tionary, as any tumour may, yet it may go on the time that any magnitude. I have seen a tumour be of small see, you may remove the mour occupy the entire half of the lower jaw, will not recur.

There are other tumours which possess that the partente subdiving the moure of tumours which possess that the partente subdiving the mounts is the partente subdiving the mounts. and it may go on further still, and can the this ha't-malagnant character. Those tubes course of any malignant tunning. Consider this which have then the checks, which what any malignant tanour of the jaw wall; often is once, for your an diere t, and wine do, and that is what this turnous also may lat its , mortage, grow, produce tirge if to. It may occupy the enough of the mouth of administration and the quently desire itself, press upon the check, not situately like, belong to the class of half-manging produce destruction of the face, so that you, in none. These to nours are gluerally con have a large ill-conditioned ulcer, with a undered to be cancerous; but it you tal tumour at the buttom of it. In short, it may laway the charace in the early stage, when run the course of any malignost disease from he taken away retirely, ture is no r The patient may dis, worn out transprofus, turn of it. You made in the afraid, in the discharge, bleeding, slaughing, and the cases, of the absorbent quantum being cons want of nourishment; for all these tumours impacted, not of the operate showing itself about the checks, jaws, and face, alto any of the vincers. Take away the who mately produce these ill consequences. The of the diseases go quite beyond it as patient is unable to take food, and absolute there is no return. You can do no more it starvation scous to be the cause of death in the patient with coulis; it is needless many cases. The turnous in it-cit, if it be give hon measuine, and try by that means allowed to remain, is just as bas as any care atop the progress of the disease. You mu cinomatous tamous, or a tumour of funderadicate the morbid growth; and the on gous hæmatoles, there being this differ- question left for us to consider is, how the once only, so far as the course of the tasteration should be effected. mour itself is concerned, - tout it does not make such tapit progress as mangious tu-mours generally do.

lar to that of a truly manginus tomour, so that I see, --- in private practice at least, far as the tumour itself is concerned. You the disease is in the early stage, and, will ask, "Why do I make this reservation; course, then, the terreter is of small air why do I say that it runs that course only and may be easily destroyed in the followir in one respect?" A truly malignant turnour, manner —First of all, all the tests, which such as scirrhus or fungous hæmatodes, scom in any way to interfere, contaminates the absorbent glands, which case must be drawn this tumour does not. The mal-grancy of the Lakon before you got former tomours seises out of something in You thus expens the state of the general system that is, in car-cinoma, or in fungous hasmatodes. baring texture. If you employ hitric acid,

In this woman's case a good deal of the ant it to operate. Whenever you They are simply a modification of the destruction of living parts, common bone-nippers, which are used for mittle operation. If you of stumps. A pair however may be made, as need only have some as I have had these made, specially for the state of list to exceed a succession,—just adapted to the shape of the and distributed his face very and distributed its face very tumour, and Atted to embrace he face very

nicely. The ferceps that I show you co tains a mechanical improvement contrived by Mr. WEISS, who is certainly a very hegenious person, and whose numerous in-ventions have been of eminent use in surgery. They move with a double lever, so that much less force is required to take off a bony tumour than is requisite with the common nippers. They were only brought home two days ago, and, as I had not used them before to-day, I was surprised to find how little force was necessary to take off this tumour-a child, with these nippers, might have placked it off with the fore-finger and thumb-of course, therefore, these nippers are very advantageous to the

Although there are many cases where the knife will not answer the purpose, and where the bone-nippers will, yet the lat-ter will not always do, for in other cases the tumour has attained a very large size, and occupies so great a part of the law that the nippers are not safe as an instrument which must leave no portion of the tumour behind. Here is a specimen in which it would not have been safe to leave any part of the jaw unremoved. Here is another specimen, in which a portion of the jaw might have been left, but still it did not appear to me at the time to be safe that any part should remain. I dare say that in some of those cases in which the whole ramus of the jaw has been taken away, the disease has been of this kind, and, having occupied the whole of the jaw, the cure required that the whole of the jaw first intention. When I took the tumour should be removed. In general, however, we are only called upon to take away a portion of the hone. The specimen I now and, perhaps, one of the most important present was taken from a private patient on observations that I have made - I found the ago; and here is another on which I ope- exactly similar structure to that of which rated about a year and a half ago. The latter patient came to London on account through the middle of it; and when I looked of the tumour on the jaw, a surgeon accom- at the patient's month, two days miterwards, expose the bone, which was then separated where the subsequent from the healthy parts, on the inside and was not necessary, below, with a saw. Of course the teeth in the neighbourhood had been previously re- lone came out of the control of the co moved. The flap of skin and flesh after-portion of it broke of wards came down into its place, the natural statements with the contraction of the parts were brought together by the inter-

nture, as in the operation for hare-mend healed by the first intention, and in only and in ealy though eight or nine days after-wards, I believe the patient was so well that she commenced a journey home—a distance of ho less than a hundred miles. It was quite remarkable how slight an appearance the scar made in the face. You could just discern the three lines, but you could ham'y tell, without looking closely at the patient, that anything had been done. I heard of this lady two or three weeks ago, and she then continued perfectly well, and a gentleman told me that you could hardly observe anything different in the face from what there was before the operation. You will think it remarkable that there should be so little disfigurement. You would suppose that a portion of the jaw being taken away, the side of the face would be shrivelled, and the chin turned on one side. This we should think is what ought to happen, but it is not what really does take place. The space from which the bone has been taken away becomes filled up with lignmentous substance, which keeps the bonus asunder, at the same time binding them together. The patient feels that she has lost some of her teeth on that side, and she cannot masticate there, but she can musticate very well on the other side.

In the other patient the tumour was of a larger size still, and I performed the operation in the same manner; the edges of the wound were brought together by antures, and all but a small portion united by the hence-and what I am now about to mention is the most interesting part of the case, whom I operated something less than a year, alveoler process behind, having in it some the tumour was composed, and I had cut panying her to town. It appeared from the I found, true enough, what appeared to be a extent of the tumour to be doubtful whe- tumour, occupying the alveolar process bether it could be taken away without remov-hind; and, more than that. I found a very ing the whole of the jaw. I performed the small portion of the tumour attached to the operation in the following manner:—I first bone in front, a small slice of it. This was made an incision down the back part of the eavily taken off, and I then introduced a very check, then another round the ramus of the narrow piece of caustic potass into the jaw, and another on the front of the check. alveolar process behind, where the remnant I then turned up the flap, and thus made a of the tumour seemed to exist, and destroyed sort of window, or port-hole, in the patient's that remnant I repeated this operation face; it was a sort of shutter; in fact, a more than once, in order that I might be circular flap of the skin of the face and quite satisfied that the destruction of the cheek was detached, excepting at the upper part was complete. This made the care a part. This flap was then turned up so as to little more tedlous than in the other care. where the subsequent application

whom I saw only a few days ago, has show continued quite well. You can feel and the ligament formed in the part where the bone was taken away. The bones are very little drawn together, for a strong ligament keeps them asunder and binds them at the same young hospital surgeon, I had a very high time. The chin is in the middle of the face, loninion of operative surgery, and I thought and if you look attention; at the patient, that in every care where nothing else could you see one side of the face a little different be done, an operation should be performed; from the other, but this you would not notice except you looked particularly at it.

In the case of the patient in the hospital on whom I have just operated, I have, as I operation and the chance of recovery ought

another day.

servations on another subject. A man came cases, is also one of ultimate success. A into the hospital, lately, with a large tumour child has scrofulous disease of the knoe, and on one side of his face, to have the tumour disease in the lungs and measureric glands, removed. I had seen him in the summer, The knee is very bad; you say that you and then finding the tumour comparatively cannot make a cure by medicine; you amountal, I recommended an operation; but putate; the stump heak; the internal disgoing out of town, I did not see him again case directly makes more rapid progress until a short time back, when a day was than before, and the patient dies. The level for the concretion. fixed for the operation. He wished it to be operation could not prolong life, which, performed on the third day, but before the however, it is always our business to exsecond day came he went away; and, in-tend as far as we can. A woman has a candeed, I do not know that he was very un- ver of the breast; you amputate it; she great doubts as to the success of the opera-- say that the operation has been successful; tion. In fact, though I recommended the may, if she live but a whole year, it may be operation when the tumour was small, yet supposed that she has gained something by parts.

operation, why did I propose to perform it? amountation was performed. A great num-Why, because the man came in to have the ber of similar examples might be presented. tumour removed, and considered that no. You may say, "the patient was not made thing also could be done for him to avert werse; no harm has been done." But I death, though the operation would probably say that harm has been done, for the pa-not prevent a fatal termination, and because tient has undergone great pain and anxiety, should be performed. I had little faith in the operation, but I thought it practicable, or if not, that I should discover sufficient in time to prevent any harm being done. The condition of the man could not be made worse, and might be bettered, but still I did not recommend the operation.

You will ask why it was an unfavourable tant disease, it did not even seem to be

all my care, and from which the disease

wight be regenerated.
Now allow me to say a few words concerning cases in which operations should or should not be performed. When I was a but I think sow, from experience, that we should be more circumspect in selecting cases for operation - that the danger of the told you, already applied the caustic slightly: to be well considered. A dangerous opera-the application, however, may not be quite tion ought not to be performed, except where sufficient, and if so, I shall apply it again on there is still greater danger to be apprehended if it be not performed, and not even then, unless the patient be made aware, at OPERATIONS IN GENERAL.—As we have least in some degree, of the risk to which he ten minutes to spare, I will make a few ob- is subjected. But the question, in many wise in so doing, for I certainly had then lives even for two years afterwards, and you now the tumour was very large, growing at the operation. But if the disease returns a great rate, having very much of the climbin three or four months, the patient gains racter of fungous Lematodes, and, apparent bothing by the amputation. She has suffered ly, considerably attached to the surrounding great pain, and a certain extent of danger from which the operation is never free), You will ask, if I did not recommend the and she dies at last of the disease for which also my colleagues thought the operation as also have the friends, which might have been avoided. And society suffers a still greater harm. Every operation which fails, makes a deep impression on the minds of the patient's friends, and you may be assured that overy such operation preveats two or three patients from undergoing an operation in cases where it might be successful. Therefore our duty to our patients. case for operation. Why, first, the disease the credit of the profession, and the good of had very much the character of a truly ma- society at large, require as to avoid operations which do not hold out ultimate hopes ant, but much resembled fungous of success. You must, I grant, perform penething of that kind (for many operations which eventually will not but very little), and it succeed, because you cannot always say beat rate. Secondly, it fore the trial is made that there is no chance. Michoeming, parts, of success; and you should give the patient with the supportylibely a chance, where he himself desired it, and e of you really see that an operation offers one. nicely. And society suffers a still describe the second of the performed. the operation, but I thought it practicable, greater barm. Every operation which fails, or if not, that I should discover sufficient in makes a deep impression on the minds of time to prevent any harm being done. The the patient's friends, and you may be ascondition of the man could not be made sured that every such operation prevents worse, and might be bettered, but still I did I two or three patients from undergoing an not recommend the operation.

You will ask why it was an unfayourable case for operation. Why, first, the disease the credit of the profession, and the good of had very much the character of a truly ma- society at large, require us to avoid opera-

all my care, and from which the di to be regenerated.

them annote and hinds them at all the particular to be performed. Waten at was a them annote and hinds them at a transfer of the particular the face, opinion of operative surgery, and I thought and if you look attentionly at the patient, that in every care where nothing else could you are one side of the face a little different be done, an operation should be performed; from the other, but this you would not notice but I think use, from experience, that we except you knowed particularly at it. scept you looked particularly at it. about be more circumspect in selecting In the case of the patient in the hospital cases for operation—that the danger of the hended if it he not performed, and not even then, unless the patient Le made aware, at OPERATIONS IN GLARRAL .- As we have least in some degree, of the risk to which he reperation when the tumear was small, set supposed that she has gained something by how the tensour was very large, see wing at the operation. But if the disease returns from which the operation is mover free!, You will ask, if I did not recommend the and she dies at last of the disease for which operation in cases where it might be succossful. Therefore our duty to our patients, reast disease, it did not even seem to be tions which do not hold out ultimate hopes of success. You must, I grant, perform many operations which eventually ail not ething of that kind (for many operations which eventually will not be but very little), and it succeed, because you cannot always say berate. Secondly, it fore the trial is made that there is no chance and the trial is made that there is no chance at the second of th, of success; and you should give the patient sty a chance, where he himself desired it, and of you really see that an operation offers one.

though you know pretty well that even if tatal at the time, yet there is always very it succeeds for a time, the success will not the disease will not be permanent. Let me, however, repeat mately return. I do not say that you are the important observation, for it is one not never to operate in antigmant diseases. sufficiently borne in mind, that the failure That would be wrong, and very foolish, for of any operation prevents some patient or sometimes the patient may be cured, and at other from resorting to an operation where other times a peneficial result may extend it would succeed, and thus every failure does harm to our art, and is injurious to tient to die of disease of the lungs, than, of society.

You will next say,-" Can you give us any rules as to when operations should or should not be performed?" I reply, of course there can be no rules, for every case may require a distinct consideration; but patient with disease in his knee, who has a sallow countscance, looking as if he had disease in the liver, and you find on inquiry that there is reason to believe that he labours under visceral disease, I should advise you not to operate in that case, for after amputation he would have a sloughing stump, and the wound probably would not heal. If a patient has a calculus in the bladder, and the bladder be much diseased, avoid the operation, for he will die. If he has a stone in the bladder and there is organic disease in the kidney (I am not speaking of a deranged action of the organ, or of alkaline urine, but, really, organic disease of the kidney, do not operate, for he is sure to die, not, perhaps, in the first week, but, probably, in a fortnight or a month. You should be very careful as to an operation in all truly malignant diseases. I do not allude to what may be called "half-malignant" diseases, but truly malignant affections, such as cancer or fungous hamatodes, and the numerous varieties of those two classes. Surgeons formerly were very ready to amputate any woman's breast which had in it a scirrhous tumour; now they are very careful how they amputate. I suppose that I do not recomu end the operation for scirrbus in the breast in one case out of threescore. You will see a vast number of these cases here, both good and bad, for all come to London to get the opinion of a medical man; and even in those cases in which I recommended amputation, the operation has much more frequently failed than succeeded, even with all my care. I have known several cases in which the operation has been performed by other surgeons, after I had recommended the pathese cases it has failed. Some of the pa- not operate upon them except you are cases tients have died immediately afterwards, pelled to do so. I have known seve and some have lived for a short period only. terical ladies who appeared to be In all these malignant diseases the opera-tion is attended with some hazard, for than that of being though the disease be in an external part, it vous, who have dis is often complicated with visceral affection; countails main

to one or two years. It is better for a pahemorrhage from a cancer of the breast. In some cases, then, you give the patient a respite, but you must be very careful and circumspect before you recommend an opr-

ration in malignant disease.

The simple operations form the best part we may venture to lay down rules to the of surgery,-1 mean that they constitute following effect: -- A patient labouring under that part of it which confers the most credit organic disease of any kind is a bad subject on the profession, and produces the greatest for an operation. If, therefore, you see a good to society. By what are called "simple" operations, how many diseases which would have become structural are nipped in the bud; and how many patients are cured of diseases which would become most distressing, but for these slight operations! And the small operations of surgery have this advantage, that for the most part they are not attended with danger. But even in small operations you are to be very circumspect. A patient may die of crysipelas after a small operation as well as after a great one. Be careful how you operate in seasons when crysipelas prevails, -when you hear medical men saying that they have had many cases of crysipelas. Take care that the patient is, if possible, always in good health, before you perform even a small operation. If the patient be a dram-drinker, or if he be one of the higher classes, and not a draindrinker, but a person who indulges freely in wine, and is guilty of other irregularities, be careful in operating. Many persons who have been accustomed to live well, especially drinkers of spirituous and fermented liquors, will die even after a simple operation which you have been obliged to perform. I once saw a lady whonot a lady-like accomplishment certainlygot drunk by herself in the morning, who died from diffuse inflammation of the cellular membrane, attended with sloughing. after the mere puncture of a very small encysted tumour. There is another class of patients in whom you should be careful how you perform operations, viz., women of the higher classes of society who are of a very nervous and hysterical habit; and, indeed, all persons who have a very bad state of the nervous system, or who belong to tient not to undergo it, and in every one of families in which mania has prevailed. Do

I have made these observations now cause, having time. I thought it as to be take advantage of the circumstance to say a few words on this important subject.

WESTMINSTER HOSPITAL.

CLINICAL LECTURE

ON A CASE OF

EMPYEMA.

Delivered November 3rd, 1835,

By Dr. ROP.

EMYLIA.—Paraccatesis Thoracis.—Autopsy.—I intended to-day, gentlemen, to address to you a few observations on the important subject of clinical medicine; but the death of Charles Dyson, who has been for some months in the hospital, labouring underempyema, has given us an opportunity of exhibiting the morbid appearances which are found in that disease, and I think it will be more profitable to you to take advantage of this interesting occasion, to direct your attention to the symptoms under which this patient laboured, and the morbid appearances which the examination disclosed.

In the mouth of June last I was requested! by our benevolent chaplain to visit this man in Regent-street, Westminster. him pale and emaciated, lying on his right side, coughing frequently, and expectorating a considerable quantity of frothy mucus. He told me that his case was considered to be one of consumption, and that he had been given over by his medical attendant. I recommended him to come into the hospital, which he accordingly did in July, and the following is the report of his case at that time :- Age 48; by trade a bricklayer, of a pallid countenance and sunken cheeks; complaining of cough, with frothy mucous expectoration, difficulty of breathing on moving in bed, but not so much so when he lies quietly; great debility and loss of appetite; his respirations were only twenty in a minute, but his left side moved very little on taking the full inspiration; his pulse was 86, soft and feeble. percussion the left side elicited a very dull sound, both anteriorly and posteriorly, and and under the left clavicle. The sound right side was tolerably clear. The aurmur was inaudible at the par a small space close to signist side it was bron-and it was accompanied a. The hours pulsations

Medition, but it was felt distinctly on the right side of the sternum. The left side right. Its intercostal spaces were obliterated, but no metallic tinkling could be heard. It could scarcely be said that any change of the sound elicited on percussion was produced by change of posture. His tongue was red and moist, and his bowels were torpid. He said he had enjoyed tolerable health until within the last five years, since which period he had been troubled in foggy weather with a cough of an asthmatic character, early in the morning and at night, but he had been able to follow his employment, until fifteen months ago, when he caught a violent cold. He states that he has never had pain in the left side, nor has he to his own knowledge ever had a plearisy.

ever had a pleurisy.

Now what disease does the history of this

case indicate? The dulness all over the left side of the chest could only be produced by one of the following causes:—lst. A lung completely hepatised, or completely tuherculated. 2nd. An extensive abscess occupying the whole lung. 3rd. Effusion into the cavity of the pleura. Now the lung could not have become hepatised, nor could so extensive an abscess have been formed, without very severe preceding inflammation, but of which we have no notice in his history. It would have been a very uncommon thing to find one lung so totally tuberculated, as to be dull every where on percussion, and to be void of respiratory murmur, while the other lung was free from disease, and the expectoration exhibited no appearance but frothy mucus. Again, neither his countenance nor his cough was by any means indicative of phthisis, and though the lung had been condensed by the deposition of tuberculous matter, yet this could not explain the cause of the displacement of the heart. We therefore concluded that the duluess on percussion was not produced by any of these conditions, and very extensive effusion was the only remaining cause. That would satisfactorily explain all the phenomena,viz., the displacement of the heart on the right side, the general dulness on percussion, and the absence of respiratory nurmur every where except at the root of the lung, where it was probably pressed against the spine and was condensed by the pressure of the fluid. Now to this supposition there were these objections,-effusion of serum or secretion of pus is always preceded by inflammation, of the severity and duration of which the patient usually gives a distinct account. Now such things were noticed in this patient's history; but it is a well-known fact that the secretion of pas is not only a consequence of very acute pleurisy, running a rapid course, and terminating in the secretion of pus in ten or eleven days; but it also arises from that chronic all in the second state of inflammation of the plears which

goes on without the patient being aware of its existence. Again, where the pleura contains fluid, orgophony is often heard. But the cheet was filled with pus. Now the death of this patient took plac the absence of orgophony in this case was a few days ago, and we took out the dis satisfactorily accounted for by the in-mense quantity of fluid which his cless to you, because you cannot form a correc must necessarily have contained, if it con-notion of the manner in which this diseas tained fluid at all. You know ægophony is to be cured, without a correct knowledge is perceived in the commencement of pleurisy, or, rather, in the commencement of the external appearances of the bod

attempt is make by matter to perform a string in costant account and another than the curre, then contractions of the chest takes humerous corruspations. A hand of densing place, and you no logger find the sound elicited membrane, as thick as the finger, extender from about the sixth rib to the laferier elgo for the lower lobe of the left lang. It was a change in the posture of the patient; and this which, doubtless, prevented all the this is one of the most important signs, and fluid from being they n off in the operation one that is the most to be relied on, in ex-amining cliusion into the chest. The part abscess* formed between the third and which sounds dull in a depending situation fourth tibe and the cost. The absert becomes clear when the position is re-seemed comined to the nuscular substance versed, from the fleating of the respiratory The right lung was studied with minute portion of the lung in the fluid. Now the tuberches. The heer was granular, conabsence of this sign in this case is to be gosted with blood, and myristicated. The accounted for under the supposition that the hidreys, in like manner, were a little palet lung has been bound down to the spine, so that than natural. No other morbid appearit cannot change its position. On whatever ances were observed. Here, gentlemen part of the chest, therefore, percussion is are the parts. They have been steep employed, it must be over fluid, unless we ing in salt, and are somewhat altered in except that part where the lung was com- colour. The lung is condensed and pressed pressed against the spine. The sound there-idown against the spine. The plears in fore must every where be dull.

cumstances, it seemed almost certain that hand passing from the lung to the inside of the patient was suffering from the effusion of the ribs. This lung was not impervious to a considerable quantity of fluid in the chest; the air, for when it was taken from the and it was more that, probable that this fluid body it could be dilated by a pair of bellows was purulent, from the circumstance which to some considerable extent. This other I have just mentioned, that it is acute pleus lung is much more solul than it ought to be, risy, which, more generally than anything and by cutting Itopen you will observe some ler, which, more generally than anything and by cutting tropen you will observe some else, terminates in the effusion of serum, few tabercles in its subtrace. You observe, to make the mutter perfectly certain, I passed into the clear a needle, interest the morbid condition of these parts,—the thickened and inflamed into the floorital, which may always be introduced with the greatest safety. Sir BENDAMIN distansion of the cavity of the pleurs with BROOKE, I have been informed has introduced this needle into the cavity of the over to the right side. joints with perfect safety. It is made like New what is the mode by a trocar, with a groove running through it, to be effected in such t through which field may escape; and on cure takes place, it me introducing this needle into the cheef in the of the pleurs, which are case of Dyson, a turbid fluid flowed out, leaving no doubt that the disease was en-

shouse which covers the ribs. You will place almost immediately. Hectic flushes therefore see that is in indipensably sixes-of the checks followed, and a pulse exceedary, in order to promote a cure, to take flugly rapid and exceedingly feelle. I exacure that the fluid be evacuated from the mined her chest, and found it almost everycessary to being the phura pulmonalis in disease, and he confirmed the opinion that it was a case of empyema. The opinion of Sir Now, then, the first question is, how is HENRY HALFORD was asked by the wish of the met with a very singular case of this kind, the cut of nine weeks it had almost totally in the month of February last. I was called classed, the respiratory murmur had retaker a servant heing in South-street, Grees turned in aboust every part of the chest, vener-square, and the symptoms under and the dainess of sound on percussion was which the fabouned were these - great not allegether gone, but very much dimi-

You will observe that this was a distinct culiar temper, and it did not occur to me at of time, and the patient's strength becomes the time to think it probable that the girl, very much reduced, the operation of paraafter an attack of so short a duration as centeris may be performed with much less three days, had such a disease as empyema, prospect of success. It therefore becomes I did not examine her, therefore, with the exceedingly interesting to inquire what are stellowcope, but I gave her three grains of the chances of recovery; or, in other words, the superscente of lead, one grain of digi- what does the result of observation teach us day, and to my great surprise the expecto- been performed. Dr. Davies, who has perto totally coased in twenty-four hours, formed the operation in ten instances of and her strength, the difficulty of empyonia, gives a table in the "Cyclopedia and in three weeks from of Practical Medicine," in which he states the time of the transfer of age, one was aged between the constraint was a state of the transfer operated on the transfer operated on the state of the patients were under the time of the patients were under the time of the patients were under the time of the transfer of proportions. Of those who were under six while allow a quantity of six to be adufitted, years of age, five cases recovered, and the which is considered to highly dangerous. reason is this, that the greater elasticity of the six of the control of a considered to highly dangerous. Now with respect to his evacuation of a the hones, makes then much more discussed as a children was a child in an area of the control of the contr the bones, makes them much more disposed to yield to the pressure, so that the pleura costalis and the pleura pulmonalis can be brought the more readily into contact, which is the point of cure.

You see, then, according to this, that the probabilities of recovery, when the operation of paracenteris is performed, are eight cases out of ten. In the medical journals of the 30th of November, 1833, there is a case of a child, seven years of age, who was operated on by Mr. Wooden, of Brompton, and he had the goodness to invite me to see the operation. It was an exceedingly weak and conscisted child, and presented the symptoms which I have just related, indi-cating empyons. The operation was performed, three pints of purplent matter were evacuated at once, and a considerable quantity of air entered at the operation, to which fact I beg your attention. The wound was suffered to heal, and the child was supported by nutritious diet, but in the course of three weeks there was reason to support that some fluid had again been secreted in the chest. The operation was performed a second time, and a smaller quantity of purulent matter was evacuated. Again air was admitted, and from that time the child went on gradually improving, so that in a short time his respiration became perfect on that side. chest on percussion was perfectly clear, and the child is, I believe, at this moment, in perfect health.

Now, as to the time of operation, I believe that it should be as soon as possible after the disease is detected, and I think the instance which is before us is a clear proof of the correctness of that observation. When fluid is allowed to remain a considerable time in the cavity of the chest, it will of necessity compress the lung against the spine; and if adhesion of the lung against the spine takes place, you will see the very little probability there is of effecting a cure. It is, therefore, a matter of very great consequence to perform the operation as soon as you possibly can, because in the early stage it is almost certain that no adhesion of the lung has taken place, that the lung is free, and that the process of cure will, in all probability, go on without interruption.

Now the next question, and one of very great importance it is, is this, whether the wound is to be allowed to heal immediately, or the canula to be left in. The reasons for advising that a canula should be left in are these, that the sudden evacuation of so large a quantity of fluid is apt to produce very great debility; and that, if you were to evacuate the whole of the fluid at once, you

exceedingly emaciated condition (I am now alluding to Mr. Wookfr's case), where all the fluid in the cavity was evacuated, without the child suffering in the least from the evacuation. Again, we have had several cases in this hospital,—one a very remarkable case, in which six pints of serum were evacuated from a man's chest, without any injury being produced from it. Certainly, therefore, as far as my experience goes, and as far as I have been able to examine the cases that have been published, I see no reason to believe that the sudden evacuation of fluid is, of necessity, at all dangerons. Nay, more, I believe that the space which the fluid occupies is filled, in a very great measure, by the air that is admitted, and the presence of this air does no harm whatever. In Mr. WOOLKY's case, on both occasions of the operation, a considerable mantity of air was admitted, and neither time did any bad symptom follow. In the case of the man who was operated on in this hospital, a very considerable quantity of air entered, and occupied the place which six pints of fluid had recently occupied, without any symptom of inflammation supervening. But in the course of two or three days it appeared as if a greater accumulation of air had taken place. The lungs on that side afforded less marks of respiratory murmur, the sound on percussion was preternaturally clear, and the breathing became exceedingly difficult. Mr. WALSH, who is now practising at Worcester, devised a most ingenious little canula, to which a piston was attached, not much larger than this needle. This was introduced into the chest, and the air was pumped out. No inconvenience followed the use of the instrument, and the patient went on to a perfect cure. I see no reason, therefore, for concluding that the presence of air is necessarily a source of danger.

Now as to the place of the operation. LAUNNEC advises that it should be performed between the fifth and sixth ribs; and the reason he gives for the advice is, that when the lungs are diseased, the attachment takes place more frequently between the superior lobe and the pleura, immediately under the clavicle, and between the lower lobe and the diaphragm, and the centre lobe is generally the freest. Again; it happened to LAENNEC to pass a trocar into what he supposed to be the cavity of the without fluid following the i and it was found upon the trocar had not the pleura at all. Termile not so uponly need of the right wide you must withe fiver is v git i

^{*} See LANCET, No. 535, page 356.

largedeand rises a great way into the realest breathing somewhat short. On the 7th of the pleurs; and a dulnest of sound of September he was ordered iodine and hybercussion may often arise from the liver defodate of potass. On the 27th of September being pushed up, and without any fluid beber a tumour was observed, between the ing present, it will be necessary in performing the constitution of the state o ing the operation on the right side to be very cautious, remembering that you are size of an orange. Baopin's needle gave in the neighbourhood of the liver, but you evidence of purulent contents. A seton will be almost certain to pass the instru-needle was passed through it, armed with a introduced between the fifth and sixth ribs.

But this is not all. Adhesions frequently take place between portions of the lung and the ribs, and, therefore, even this direction is not sufficiently minute. In Mr. Wooley's completely, so that on putting the car to that part of the chest, you heard the respiratory murmur distinctly, but as the ear was brought forward, you found the respiratory murmur was almost inaudible. It therefore became necessary, instead of puncturing between the fifth and sixth ribs, close to the latissimus dorsi, to bring the instrument still further forward, and to choose that part where all sound of respiratory murmur was absent. Therefore, before you attempt to perform the operation, you ought to examine with great caution, and ascertain case was that, when the operation was per-that no respiratory murmer is present, and formed, though such a considerable quanto be perfectly aware of the possibility of adhesion between the lung and pleura.

Now having said so much upon the nature of the disease, and the mode which is adopted in order to effect the cure, we will conclude the history of Dyson's case :- On the 9th of July a flat trocar was introduced between the fifth and sixth ribs of the left side. On pushing it in, at first it seemed to carry the pleura before it, for on withdrawing the trocar from the pleura no fluid followed; but by plunging it suddenly in, the pleura was punctured, and about twenty-eight onnces of a turbid yellow serum, with flakes of floating lymph, were thrown out. The chest emitted no clearer sound after the operation had been completed than it did before. On the 11th, the patient is reported to have remained much in the same condition; his breathing was somewhat good, and his general health was improved, but the left side was not in the least degree clearer on percussion than it was previous to the operation. Severe ptyalism came on after that, from a small dose of calomel and rhubarb given on the 14th, the effects of which continued to the 31st, after which time his general health seemed daily to im-Move, and he was able to sit up for several in the course of the day.

15th. He is reported to have in the same state. Since bing has been quieter, meh improved, but in has taken place on the let of September

clastic, and fluctuating, and of about the size of an orange. Baodin's needle gave ment into the cavity of the chest, if it be skein of silk, and the contents of the tumour were evacuated. A discharge was kept up, supposing the tumour to be connected with the interior of the thorax. Four days afterwards he was reported to feel much easier. The secon went on discharging, but not in case the lung adhered posteriorly, almost such quantities as to warrant a supposition that it communicated with the chest. The discharge was of a thin purulent character. and the patient now seemed to be losing strength daily. On the 15th he was considerably worse; he could not then sit up, and he suffered much from difficulty of breathing. On the 19th there was lividity of the countenance, blueness of the lips, coldness of the extremities, and depression of breatking, which symptoms increased until the 22nd, when he died.

The one thing of chief importance in this tity of fluid was in the cavity of the chest, only about eight-and-twenty ounces were withdrawn. We felt at a great loss to account for this, for there was not the slightest doubt that a great quantity of fluid still exist-ed in the cavity. We thought it possible that the circumstance might be accounted for by the pleura having been sacculated. You will find cases published by Dr. Townsend in the Cyclopadia of Practical Medicine, - there are one or two mentioned, -in which the adhesion took place at different parts, forming three or four distinct cysts containing fluid. We thought this might have been the case here, for on passing the needle higher up, a short time afterwards, the fluid again escaped, showing clearly that there was still a considerable quantity remaining; but I now believe the explanation of all this to be, that, from the position in which the man was lying, the canula must have come against this band, which, as I have already shown you, existed, and which prevented the evacuation of the fluid. But you may ask then,-" Why not have performed the operation again?" Why. the reason was this; the man took two grains of calomel, combined with ten grains of rhubarb, to open his bowels, through which ptyslism came on, and the man hecame so exhausted as to make it evident that all hope of recovery was gone; we did not, therefore, think it right to submit him to the further pain of another operation, because, even though we had aucceeded at this time in evacuating the finid, it could not have been attended with access. His strength was then supported

as much as possible, and nothing more was girl, about five years old, who was being done than to alleviate, as far as we could, symptoms as they arose, until his death. 1 must, however, say, that if a similar case were to occur again (and this is admitting that we did not do all we might have done), I should certainly perform the operation, because I believe there could be no possible hope of curing the man except by the evacuation of the fluid from the chest.

ON THE

TREATMENT OF FRACTURES

WITHOUT THE AID OF SPLINTS.

By W. C. RADLEY, Enq., Surgeon, Newton Abbutt, Devonshire.

(Concluded from page 251.)

to me, that whatever is written, which does never found ease. Observe a child asleep, wasted, and so much talent misapplied.

right, have ended happily! The rie medica- tractures. But sound reasoning, and a simtric nature in the case of fracture, - a cause ple, natural, and therefore a correct pracof suffering that daily furnishes abundant rice, founded thereon, are very different sources of observation, and for the cure of things; for Mr. S. Cooper and other surwhich so little has been done in the way of geons recommend the thigh to be put in the improvement since the days of Hippocrates, straight position of Dessault, - a position - is that portion of our art to the considera- which must be inksome to many, because it tion of which I am now striving to direct is unnatural to those who through wearings attention. How often have I seen acci- retire to rest. It is not the position of the dents made worse by meddling ignorance, tired sleeping child, who is almost bent into or by the supercrogatory offices of mis- the form of a ball. But to return to my little taken nid, yet ultimately triumph over all patient, those retarding checks! This voluntary. An ev power of reparation is the true magni Dei seeing the child so easy under a fracture of datum to human nature, and " not cinchona the femur, shrewdly suspected that the bone bark," as a popular doctor once said. This was not broken at all, and that the surgeon power, however weakened, is always ready was only "making a job of it." She whisperto assist us in surgical curations, and only ed her suspicions to another old crony (the waits to be guided or followed aright, to child had lost its mother), and these wrotches fulfil our intentions.

fracture in a middle-age liman, in an old and was displaced. The inlection feeble woman, and in a very robust subject, and felt the crepitus were detailed, all of which were cured by and, conscience-strice

the splintless method.

Case 4.—The next case I shall mention age, and, secundem artis, plint occurred in August 1830, in a weak little the pieces of vencer, though with

carried in the arms of her sister, when both fell together, and the younger had her thigh simply fractured. The name of the child was Towse, and she lived in Newton Bushel. The bones were brought into apposition on n pillow, a handage was applied, and some isolated slips of thin mahogany rencer, were lightly placed here and there over the charse of the fracture, - for show, not for use, not exerting any effect. My reason for placing them so, was to propitiate the ignorance and prejudice which always strennously contend for retaining old forms. I thus affected at that time to do as others did; but not so now. The child remained under the evaporating action of a moist bandage, in an easy state, for four days, sometimes half sifting, resting on her elbow in bed, and playing with her fellows. She ate and drank as usual, and slept without disturbance, for the limb was placed in the natural position, That donkey-like emulation which makes which I in a great degree had let her choose "every ass think his own bray the hest," and which she said was easy to would be extremely diverting, were it not her. Would she have so kin at ease with her true that struggles for place and prece. little thich outstretched upon a splint? Or dence cause the great interests of humanity even with a rather tight buildage around to be neglected or forgetten in the contest, it? Certainly not. Where there is the least In our noble profession it has long appeared, feeling of restraint in such cases, I have not either directly or indirectly tend to the and note its natural and "easy positions," alleviation of suffering, is so much time. What an admirable passage is this on position in fractures!- "The most easy position It is sickening to observe the rage with of the limb is that which is usually chozen which novelty in medical science is pursued, by a person who is sleeping; for then all while every-day cases are little understood, motion is suspended, and every part assumes and therefore ill treated. Yet in spite of that posture which is most congenial to the neglect, how frequently do we discover cases pinds." This passage prevents a foundation that have gone on unassisted, or have even for a superstructure of rational arguments in been malticated, which, with a little setting favour of sound practice in the treatment of

An evil-minded old woman on the fifth day, iffil our intentions. | took off the bandage, and actually placed In the former part of my paper, cases of the child upon its feet! The bone is

pressure than a consistent with any mode of far the most important and essential. With-procedure. The aid ultimately did well; out them, indeed, it would be in vain to atand so, indeed, do others, even where much nanecessary force is employed. Mr. Gaye, my esteemed friend, makes very good cures indeed, and uses splints; but he is extremely careful, and does not employ a tithe of that force which I have seen employed. Sta, I repeat, that all splints are useless. Parden me for saying as much for about the twentieth time; but I should continue to say so to the twenty thousandth time, to banish splints from surgery.

CASE 5 .- Richard Curnell, aged 45 I think, a pauper in the village of Kingsteignton, in the month of August 1831, slid from the top of a large corn rick which he was thatching, and fell to the ground. The height was upwards of twenty feet. The part of this paper. A man named William clavicle and the femoral shaft on the right Tickle was standing between two pieces of side were both fractured. The fractures were not compound, but the depth of his fall and the violence of the shock greatly the bones against the flat side of the oppo-aggravated the symptoms. The thigh was site stone. The state of his health and placed on a long pillow, on a bed perfectly soft, and treated with the tailed bandage, wetted with cold lations; the skin was sponged with topid water several times a day, allowed freely to evaporate in the common atmosphere of his toom. As the cure advanced, camphorated and oily embrocations were applied generally over the limbs, of leather, overlapping the tractured portion. kept on with a bandage, perfected the cure.

The progress of this case was as satisfied tory as a anisfortune so severe could be; for the patient's sufferings were obviated by he was a member of a "Sick-and-Hurt Ch.l.," so he did not hurry himself in getting about ings of the poor are most easily excited; against their medical attendants on matters; which have even only the appearance of rationality to justify complaints, which in such of Ideford, on the 22nd of January 1831, cases as these might be thought well justification on a dark night, overturned a

tempt to keep the extremities of the fracture from being displaced." Once more I repeat, that I have never found cause to attempt to keep the fractured ends of bones together by splints and tight bandages. The bones stay in their places, and maintain good and proper positions, without giving me the unnecessary trouble of making the attempt. And why? Because I have never, by irritating causes, given the muscles rea-son to be angry with my treatment, and, as an expression of their resentment, to "dis-place" the bones, and give me the trouble and the patient the pain of again reducing them.

Two cases of dreadful compound fractures. terminating fatally, were hinted at in a former granic, one of which, about a ton weight, tell algeways against his leg, and crushed strength would not warrant amoutation, and he died of mortification, extending through the body, on the ninth day. Mr. Gervis of Ashburton saw him, but nothing more could be done to save him.

The other case was that of the man named George Cole, who, in the month of December 1826, had both legs dreadfully and, at last, the supporting circular plaster; shattered by a premature explosion of gunpowder placed in a horizontal hole in a mass of granite. Mr. Gervis saw him with me, and I determined to take him to the Exeter Hospital, with the concurrence of Mr. Gervis. He was removed thither in a simple management, and fortunately for him spring car upon a feather hed. He hore the journey well, suffered amputation of both legs on the following day, and died too soon, like some poor fellows must do, two days afterwards. These are the only One circumstance occurred in the progress fatal cases of fracture that have occurred in of the cure which pleased me. The clergy- my practice, and fatal they would have been man of the parish, the Rev. T. W., in his anywhere. But there are very many of my accustomed visits to his sick parishioners, patients whose present habitations and mine expressed surprise "that splints were not are, by the hand of fortune or of death, far applied to Richard's thigh;" but when he separat d, -- who could have borne most found that it was not a part of my plan to ample testimony that their fractures were apply splints, he pointly acquiesced, and rured by the means which I have described ceased to advocate their use; for which I in these papers. My next case is one of thank the reverend gentleman,—for many great importance in the history of the mode reasons, one of which is, because the feel- of cure now insisted on.

CASE 6.-George Wills, aged 30, living when such men as Mr. Pott, to use his heavy cart, the rail of which fulling across clare, "that without splints the his leg, fractured both the tibia and the fibida. He had, some three or four years of fractured bones," fibida. He had, some three or four years had writer, with more of a cart. And now for the contrust in the a source us, that " of treatment on the two occasions. In the ent pieces of the apparatus for first accident the limb was splinted up most int of fractures, the splints are by carefully -so carefully that he was kept in

bed for seven weeks, and a considerable it was only four miles from Newton. The time afterwards elapsed before he was able limb during the internal was frequently to work. On this occasion it was my turn bathed with warm was and lotions,—first to assist him. The fracture of the tibia was of Plumb. Superaces, challen, next—R. P. as oblique as it could be, the superior portion overlapping the inferior, and the point of the obtruding end above, having nearly penetrated through the skin at the small part of the leg. He was now placed in bed with his leg on a pillow, in the way which I have already sufficiently described, and, leaning on his elbow, he watched proceedings with much attention.

"Which way do you most usually lie in bed?" I asked. "Do you prefer lying on your back or your side?" "On my right side." "Very well," said I. He was then reclining on that side, it was his right leg that was fractured, so he remained in the same position. The leg was first gently extended with genuflexion, and the thigh a little raised towards the pelvis. A very slow and refterated course of extensions was then made, until the contour of the limb pleased me; the tailed bandage was next laid on, and then the pillow was tied up, padding it to a regular bearing on every part, and until the patient said, on being asked, that it lay easy in every respect-not harder at one point than another. The following dialogue then followed: -

Wills (reclining, half raised on his elbow) .- "Why, Doctor, don't you put splints

on my leg?"

R .- " Because, my friend, I always cure

broken bones without them.

Wills .- " Humph! Well, to be sure, Zir, you ought to know best about it; but when I broak my leg last time, that Doctor splinted et up well all the time I was in bed.

R .- " And for how long a time was that? Wills .- " Why, rather more than zeven weeks in my bed and room, and the splints were kept on arterwards too."

Were the splints applied tight or not?"

Wills .- " Tight, i'fath! ah tight zure cnough!"

R.-" How did your leg feel? Was it not very hot and painful at times?"

Wills .- "Iz, i'fath! 'Twas pain zure enough, it beated and clapped like one's pulze agwain (agoing), and I coud'nt sleep nor be azy, all day and night long, for a good while, and I ax'd the Doctor about et, but he told ma I must hear it, bekaze the bone coud'nt be cured without ct.

R.-"Well, no doubt what you say is true enough, I don't in the least doubt its truth; but don't you fear: I shall, in four weeks, make as good a cure of your leg as the other was in seven weeks, and you shall

not suffer this time."

Wills lay back in bed and shook his head, but answered nothing. His looks expressed his doubts without any necessity for speech. I saw him three or four times that week, as and paid me to with thanks.

tassa Nitratis 3 solve in Agua bilj. Tr. Opii, et Marrha, aa. 28s. Add. The bruise from the eart rail on the stense was sever, and he took Extr. Beladonne gr. ij ad gr. vj om. noct. with composing effects. On the seventh day Lint. Saponis Comp. was used to moisten the sore and tender surface of the leg. Lotion for the handage as before.

On the second week I saw him but twice. and on visiting him on the nineteenth day from the accident, never had I felt more surprise in such a case. I found my patient delighting himself at my expressions of surprise, with his leg resting on a pillow upon the long seat in the kitchen. I warned him. with some feeling, of the danger of coming down-stairs, thinking it premature, being a fracture of both bones, and one bone in this case could not become a support to the other-always better than a splint, if you please. But on looking at his leg I found that no limb could present a more fair and equable surface. He was a young and healthy man, yet the short time occupied in the remedial process surprised me. Union had taken place, though not firmly. While cogif ting over it, the jocose fellow threw the flexor and extensor muscles of his leg into strong action, which made his leg bend at the fractured part like an osier twig. I felt the blood rush into my face, and exclaimed-" If your leg is so well, don't play the fool with it." "Why, Zir," said he, "'lis no pain to me, " No, I don't suppose it is," said I, " but 'tis the right way to do mischief."

A medical man is all his life a student. Every case presents some new claim to his notice. Talk of displacing bones when once fairly reduced! Why, 'tis the surgeon's fault or the patient's, certainly not the fault of nature in her uninterrupted operations. The man did not displace the bones at all, and I was not slow in passing a circular overlapping plaster around the united parts, on my next visit, with a warm and comfortable bandage, the month being February, - the depth of winter. Words can faintly tell how delighted and thankful he was at this, to him, surprising cure. To be cared without pain was unaccountable to him, and he was endless in his contrasts between the two methods. No man could be better pleased, and he was, with additional good reasons, pleased, when he compared my charge with his former long bi

On the 25th of February, than five weeks from the dent, I called and reno had been out of doors superintending his man

CARE 6.—Mr. Bowden the master, fract which was broken obliquely, transversely, tured his flouring in the following Christman, four or five inches below the lower edge of also dislocating his ankles. He lay in bed the patella. The fracture was one of "the but a month and then beautiful the patella. but a month, and then recovered. He could not bear a plaster around the part, but got well without it.

CASE 7 .- An old Newfoundland man, residing in Kingkshenwell village, presented a schewhat parallel case. Twenty years before, and it had been my turn to serve him ; he had broken his leg while engaged in the Newfoundland fishery. One night in the Christmas season of foolish carousing, he fell down on his road home, in the dark and dubious way, and again broke the same unlucky leg. This might be called act the unlucky leg. This might be called act the second. His leg was treated with the same routine as my other cases, though with very He returned to his humble materials. work at the end of four weeks, and many a sailor like oath did he bestow on "the blockhead of a doctor" who had kept him "so long belayed in board splints and blankets, in his berth, on board the old brig, on the banks of Newfoundland."

CASE 8 .- Another case, which occurred the Christmas before, was that of a man 50 years of age, who had lived freely. Walking over a wooden bridge on a frusty night, his heels slid away, and he fell backwards, and the elbow of one arm received the violent shock of his descent He was a very heavy man, and the injury was correspondingly severe. Being at a distance of four or five miles, they did not send for me until the next morning, when I found the arm much swollen. The humerus was fractured obliquely, passing into the elbow-joint, and the inferior portion of the hone projected anteriorly, where the biceps muscles become tendinous, and the bone just pointed through the integuments, and made it a work of time and tact to reduce it, as the hone stuck in the tendinous expansion. Here was a compound fracture, with complications enough, and a bloated constitution to boot. Did I place this dreadfully injured arm in a splint? Would any other surgeon have laid it on a splint of any sort? Let the practice of Sir Astley Cooper and his colleagues answer,a practice recommended by lofty-minded men, in elevated stations in society, with all the force and influence of splendid folios. This man employed all the little resources which I could suggest to reduce the alarmingly increased action of the arm and forearm. Many would have recommended amputation at first, but he escaped that, and pagrene also, and in five weeks left his bed. bring a fork or a cup to his mouth. 20th of August last, Mr. of this town, while driv-well, had the harness we debed him soverely icks partion of the tible,

worst" species of simple fracture, as it is termed, the iron points or talons of the horse's shoe inflicting two wounds at the line of fracture, one of them deep and lacerated. There was much tumefaction in two hours afterwards, when I was called in. Truth compels me to say that a practitioner had examined the injury before I saw the patient, but a sudden obstetric call made him leave in a hurry, and the splints were left behind also. I reduced the ends of the bone, and bandaged and laid the leg on a pillow, in my old way. The pair of neatlyturned hollowed-out splints lay on the chest of drawers, and there they remained. " No, said I, as they lay there to tempt a surgeon to use them, "you are for ever banished from my hands. No more the galling splint for me; no more!"

Mr. Leslie, who usually attends this family, entered at the latter part of the bandnging-up, and, with true politeness, did not alter the state of things. It always gives me pleasure to record such instances of urbanity. The patient did well up to three weeks' end. Mrs. Russell was a very clever nurse, and bathed, and managed well the wetting system, turning the bandage off and on many times in the twenty-four hours. I am delighted to attend on these cases; they are worth a man's efforts and energies to relieve them. Mr. Leslie being away, I saw Mr. Russell every day, until Mr. Leslie returned, and splinting up the leg, took him This was on the eighteenth out of bed. day from the accident. Union had well advanced, the cure was so far complete, and the patient's impalience would not allow him to remain longer a-bed. The splitts were long, and well-padded, and as no particular soreness remained, they did no harm,-nor good, excepting that the patient's mind was assured that they would be "a safeguard against accidents." But their appearance is to me always awkward and grotesque in the extreme. Mr. Russell went down-stairs in a few days afterwards, and on Tuesday the 22nd of September, two days less than five weeks from the accident, he stood on the grassy plain of Denbury Fair, vicwing the horses, and soon wholly recovered, by the aid of the wide circular overlapping plaster and bandage, he having previously laid aside the splints.

Case 10 .- The last case, and to me and my patient not the least gratifying, I shall mention, may now be examined by all those who feel concerned in such misfortunes. who retr concerned in ance missorthes, Cherry Tracey, aged 40, the mother of ten children, on Wednesday, the "glorious" 21st of October last was gathering accorns, when, while holding fast by a small branch with one hand, and picking

He was now placed in hed with his leg on a pillow, in the way which I have already sufficiently described, and, leaning on his elbow, he watched proceed- leg. Lotion for the bandage as hafore.

ings with much attention.

"Which way do you most usually lie lo bed?" I asked. "Do you prefer lying on your back or your side?" "On my right side." "Very well," said I. He was then reclining on that side, it was his right leg that was fractured, so he remained in the same position. The leg was first gently extended with genuflexion, and the thigh a little raised towards the pelvis. A very slow and reiterated course of extensions was then made, until the contour of the limb pleased me; the talled bandage was next laid on, and then the pillow was tied please. But on looking at his leg I found up, padding it to a regular bearing on every part, and until the patient said, on being asked, that it lay easy in every respect-not harder at one point than another. The following dialogue then followed: -

Wills reclining, half raised on his elbow). -" Why, Doctor, don't you put splints

on my leg?"

R .- " Because, my friend, I always cure

broken bones without them.

Wills .- " Humph! Well, to be sure, Zir, you ought to know best about it; but when I broak my leg last time, that Doctor splinted et up well all the time I was in bed.'

R.—" And for how long a time was that?

Wills .- " Why, rather more than zeven weeks in my bed and room, and the spints! were kept on arterwards too."

R .- "Were the splints applied tight or not?"

enough!"

R.—" How did your leg feel? Was it not

very hot and painful at times?"

all day and night long, for a good while, and can faintly tell how delighted and thankful lax'd the Doctor about et, but he told ma he weret this, to him, surprising cure. To I must bear it, bekaze the bone cond'nt be be cared without pain was unaccountable cured without et."

R .- "Well, no doubt what you say is true enough, I don't in the least doubt its truth; but don't you fear: I shall, in four weeks, make as good a cure of your leg as pared my charge with his former lough the other was in seven weeks, and you shall

not suffer this time.'

Wills lay back in hed and shook his head, | dent, I called and rone but answered nothing. His looks expressed had been out of doors his doubts without any necessity for speech. superintending his man I saw him three or four times that week, as and paid me off with thanks.

On the second week I saw him but swice. and on visiting him on the nineteenth day from the accident, never had I felt more surprise in such a case. I found my patient delighting himself at my expressions of surprise, with his leg resting on a pillow upon the long seat in the kitchen. I warned him. with some feeling, of the danger of coming down-stairs, thinking it premature, being a fracture of both bones, and one bone in this case could not become a support to the other-always better than a splint, if you that no limb could present a more fair and equable surface. He was a young and bealthy man, yet the short time occupied in the remedial process surprised me-Union had taken place, though not firmly. While cogitating over it, the jocose fellow threw the flexor and extensor muscles of his leg into strong action, which made his leg bend at the fractured part like an orier twiy. I felt the blood rush into my face, and exclaimed-" If you leg is so well, don't play the fool with it." "Why, Zir," said he, "'tis no pain to ure. " No, I don't suppose it is," said I, " but 'tis the right way to do mischies."

A medical man is all his life a student, Every case presents some new claim to his untice. Talk of displacing banes when once fairly reduced! Why, 'tis the surgeon's fault or the patient's, certainly not the Wills .- " Tight, i'fath! ah tight zure fault of nature in her muntercupted operations. The man did not displace the bones at all, and I was not slow in passing a circular overlapping plaster around the united Wills. "Iz, I ath. Case 6.—Mr. Bowden, the master, fractured his fluidicing the following Christians, also dislocating his galde. He lay in Sed but a month, and then recently did not bear a place of small the part, but get well without it.

CASE 7. - An old Newfoundland man, residing in Kinghshenwell village, presented a somewhat parallel case. Twenty years before, and it had been my turn to serve him; he had broken his leg while engaged in the Newfoundland fishery. One night in the Christmas season of foolish carousing, he fell down on his road home, in the dark and dubious way, and again broke the same unlucky leg. This might be called act the second. His leg was treated with the same routine as my other cases, though with very humble materials. He returned to his work at the end of four weeks, and many a sailor-like onth did he bestow on "the blockhead of a doctor" who had kept him "so long belayed in board-splints and blankets, in his berth, on board the old brig, on the banks of Newfoundland."

CARE 8 .- Another case, which occurred the Christmas before, was that of a man 50 years of age, who had lived freely. Walking over a wooden bridge on a frosty night, his heels slid away, and he fell backwards, and the elbow of one arm received the violent shock of his descent He was a very heavy man, and the injury was correspondingly severe. Being at a distance of four or five miles, they did not send for me until the next morning, when I found the arm much swollen. The huncrus was fractured obliquely, passing into the elbow-joint, and the inferior portion of the bone projected anteriorly, where the biceps muscles become tendinous, and the bone just pointed through the integuments, and made it a work of time and tact to reduce it, as the bone stuck in the tendinous expansion. Here was a compound fracture, with complications enough, and a bloated constitution to boot. Did I place this dreadfully injured arm in a splint? Would any other surgeon have laid it on a splint of any sort? Let the practice of Sir Astley Cooper and his colleagues answer,a practice recommended by lofty-minded men, in elevated stations in society, with all the force and influence of splendid folios. This man employed all the little resources which I could suggest to reduce the alarmingly increased action of the arm and forearm. Many would have recommended amputation at first, but he escaped that, and serens also, and in five weeks left his bed. bring a fork or a cup to his mouth.

the 19th of August last, Mr. of this town, while driva hill, had the harness the concess the control of the third of the this, and the this,

the patella. The fracture was one of "the was broken obliquely, transversely, worst" species of simple fracture, as it is termed, the iron points or talons of the horse's shoe inflicting two wounds at the line of fracture, one of them deep and lace-rated. There was much turnefaction in two hours afterwards, when I was called in. Truth compels me to say that a practitioner had examined the injury before I saw the patient, but a sudden obstatric call made him leave in a hurry, and the applints were left behind also. I reduced the apply of the bone, and bandaged and laid the fee on a nillow, in my old way. The pair of neatlyturned hollowed-out splints lay on the chest of drawers, and there they remained. "No," said I, as they lay there to tempt a surgeon to use them, "you are for ever banished from my hands. No more the galling splint for me; no more!"

Mr. Leslie, who usually attends this family, entered at the latter part of the bandaging up, and, with true politeness, did not alter the state of things. It always gives me pleasure to record such instances of urbanity. The patient did well up to three weeks' end. Mrs. Russell was a very clever nurse, and bathed, and managed well the wetting system, turning the bandage off and on many times in the twenty-four hours. I am delighted to attend on these cases; they are worth a man's efforts and energies to relieve them. Mr. Leslie being away, I saw Mr. Russell every day, until Mr. Leslie returned, and splinting up the leg, took him out of bed. This was on the eighteenth day from the accident. Union had well advanced, the cure was so far complete, and the patient's impalience would not allow him to remain longer a-bed. The splints were long, and well-padded, and as no particular soreness remained, they did no harm, - nor good, excepting that the patient's mind was assured that they would be "a safeguard against accidents." But their appearance is to me always awkward and grotesque in the extreme. Mr. Russell went down-stairs in a few days attorwards, and on Tuesday the 22nd of September, two days less than five weeks from the accident, he stood on the grassy plain of Denbury Fair, viewing the horses, and soon wholly recovered, by the aid of the wide circular overlapping plaster and bandage, he having previously laid aside the splints.

CASE 10.—The last case, and to me and mention, may now be examined by all those who feel concerned in such misfortunes. Chorry Tracey, aged 40, the mother of ten children, on Wednesday, the "glorious" 21st of October last, was gathering acorne, when, while holding fast by a small bysach with one hand, and picking

20

with the other, the twig broke, and the fall with force enough to fracture the tible transversely. This was a mild case of the sort. I saw it nine hours after the accident, and applied the wetted bandage over the leg. The fracture was one inch only below the centre of the bone. A pillow was too high for her leg, because she sank down so low in the bed; a little hollow was therefore nestled out for her leg in the bed itself, and therein the limb was padded up, on a good plane. She began to do well at once, and on the Saturday week after, in the evening, ten days only from the accident, on calling to see her, and asking her when she thought she would like to get out of bed, she replied with timidity, "Ha, sir, I have been out a little to-day." She actually had been out little to-day. for three or four hours. I cautioned her to beware, but she regularly arose in the morning, and remained out the whole of the day every day afterwards. A plaster was applied around the leg, in the usual way, with a bandage, by which means, in her two rooms on the same floor, she manages, with crutches, to perform her family attairs for a husband and several children. All this was done spontaneously, before I was aware of the full extent of her recovery. Indeed, the reader may have observed, that nature has often outrun my expectations in the progress of her work. I have assiduously watched the progress of this case, taking care to hammer in a rough nail in the end of each of her crutches, lest some slip should produce an unlucky fall, and mar this al-most wonderful and truly surprising cure. 1 believe the quickest union before recorded is one of twelve days, in a child, but this exceeds it in rapidity; but as to the degree no one can speak. A woman who has passed the prime of her days, having had a large family, enduring privations as a pauper, was here able in some degree to rest her foot on the ground, in ten days after the occurrence of the fracture! Let the doubters of splint-less cures hear this. Will they still assert the indispensable necessity of using splints? At the end of my present argument had I desired a case to form a climax, what fact could be more appropriate than that which I have just stated? Let the case be examined by any person. Let the rev. gentleman of Kingsteignton institute a personal scrutiny into the facts which it presents, and then let me have a fair meed of praise for introducing and advocating a mode of cure so benign in its influences. More than this I do not wish; with less I will not be satisfied.

In conclusion, let me address a few words in juxtaposition.

to the young student, whose mind is ardently But should both these bon engaged in a search after truth, and who do not fear they will be to has time and patience to consider the facts a condition to sustain the of a case. I will, in fancy, place myself in in such a state is like a dissecting-room, and imagine the shade of ceived a stunning kaoc Brookes, - would that he could m body still cannot rise again, until there is

be here, to descant on some such anatomical and physiological and cts as the following:

Every rib exocit the deat and the last is wedged between its neighbour ribs. Gravely the rib is shielded superiorly, and supported below by its fellow rib, the first and last excepted. In a fracture of these bones, each of its fellows forms a natural support to it. You cannot apply a splint here, and if you could, the natural allies of each rib would form a better support than any artificial aid.

The radius and ulna sympathize with and support each other, in the misfortune of fracture happening to either; while, with one point of exception, from peculiarity of structure and office, the interesseous muscle and ligaments keep them in close contact, and they cannot therefore require the aid of splints. If both these bones at once are broken, be assured it will be quite natural for them, like the Siamese youths, to lie still together, unless you molest and "bind them fast in fate," in the painful fate of splints.

Is the humerus or the femur broken? The latter, in particular, is invested all around, and beautifully and strongly inclosed within, by integuments,-by an unyielding fascia made tense at the pleasure of the will, supported by a mass of muscles, its natural defenders; with a host of vessels to supply it with warmth and to afford the means of restoring its continuity, a continuity not lost, but merely interrupted; nerves, also, exquisitely alive to pain, which warn of the approach of danger, and will not impel their obsequious servants, the muscles, to disturb the bone, unless offended by irritating causes; and if through force or violence the bone is impelled through the investing coverings, reduce it to its place in situ, and all will be well, if you withhold interference with the operations of nature.an interference that will be prejudicial, though honest.

In a fracture of the fibula we need not trouble ourselves with splinting, because its tried friend tibia will, with rest, compel it to keep its own place better than any external aid. Again, is the tibia itself broken? The interesseous ligament, when not ruptured, is a firm band of union between the two bones, just commensurate with their length. We may further quote the words of a good surgical authority:—"The fibula resists the causes that tend to produce displacement of the tibia, when fractured." Thus much for the support given by bone

recovery of struction. So the leg, if not state the my system in the glowing lanirritated, will the disposition to He still guage of science, and in a style which will
until well recovered. Assist the cure, and
charm the world to a belief of its truth. For

though I myself well know that in all cases

pain on it.

Reverse all this. Apply the splints First you will irritate, and then forcibly repress the influence of a most sensitive nervous surface, compressing arteries, veins, and absorbents, and then combatting the ill effects until you conquer and subdue their friendly resistances to your vile force, ultimately bringing some portions of the soft parts into painful collision with the fractured ends, to be grated between their sharp margins, - to be jagged by the teeth like fragments of the broken bonc.

If a surgeon who is also an anatomist, after pondering over these cases and arguments, still continues to apply splints to fractures, should not he -

But the language of sarcasm is not my forte, nor do I wish to use it, save by way of useful aid to mild arguments. Yet the importance of lessening human suffering, warrants the use of every means of rhetorical force. Let it not for a moment he thought, that in describing the ill effects of coercion and undue restraint under the employment of splints, I have at any time used the lan-guage of hyperbole. No; the superfluous misery endured in the slow and painful course of past ages, under the splinting system, can never be exaggerated in description. What a huge mass of human suffering has arisen from the unnecessary inflictions of pain by splints alone! I do not rashly speak when I assert that full one-half of the misery which has been endured in fractures, has arisen from the long-continued use of splints, or, in other words, what pain has been heaped upon us in these cases by maltreatment alone! But shall we still persevere in this course? Shall we still go on rolling up the Pelion of our powerful but foolish exertions to load the Ossa of unavoidable calamity? Forbid it, Heaven! Unavoidable misery is a mountain huge enough in itself to press us to the dust, without the weight of extraneous and gratuitous evil.

But granting all I have advanced to be strictly true; if, instead of myself, who occupy a private station, some one of those men who stand the highest in our profession, had first proved the truth and value of the splintless system, and then had sounded forth the great improvement to the world. with how much greater celerity would the change advance, and how much more worof public adoption and of confidence e considered!

ver, it has been introduced discrity of talent which.

of fracture, my mode of cure is to the patient the safest and the best, and, beyond dispute, cannot be surpassed in the simplicity of its operation; yet slow is the progress of first improvements! But I am well convinced that surgical art will not have reached the acmé of perfection, without some such simple plan of treatment as I have endeavoured to press on the consideration of my professional brethren, being first adopted. Yet an age may pass away before this mode of cure. waging war as it does with a multiplicity of interests and prejudices, shall conquer and prevail. Before I shall have aroused the attention of the carcless, made converts of the rich, persuaded the proud, convinced the opinionated, and compelled the interested and the obstinate to yield to the influence of shame, many years may have rolled away. Thrown then, as it is, gratuitously on the professional public, I hope that the public will give a fair trial to the system of cure, and pass a fairly considered verdict on that which I design to confer benefit on thousands of suffering individuals.

Nov. 10th, 1835.

REFLECTIONS

UPON

INFANTILE REMITTENT FEVER.

By JOHN ALEXANDER, M.D., Physician to the Infirmary for the Diseases of Children. Manchester.

(Concluded from page 410, No. 617.)

"WHATEVER splendour," remarks an experienced writer, "the actual treatment of diseases may reflect on the science of medicine, it by no means comprehends the whole of its province; for prevention being in every case preferable to remedies, the medical art would be more imperfect than other science were it devoted only to the latter.

Let us then (with a view to prevention) briefly allude to those circumstances which favour the origin of infantile remittent fever. They are of varied character. The neglected inhabitant of the damp cellar and the petted lordling of the luxurious nursery the half-fed child and the highly pampered offspring, are alike prone to an attack; the latter from the absorbent system being encumbered with a load of nutriment which but too often requires a fever to admit of its removal, and the former from defecthe facts and rules tive nutrition, developing a morbid action ed will, ere long, he which is observed to be equally excited by shed by some man of deficient or by superabundant support. and standing in society, who Hence it results that a child threatened with the malady under consideration, these to claim rable digest of the party of chart, regarded relatively to the ascertained matura (wills "Cyclopantia" differential the remarks from conclusively as a large of the conclu what scanty diet; whilst the debilitated and examplineous must, if possible, be more warmly clothed, removed to drier sir, and have better support. Unhappily, the last important desideratum is one which every medical attendant upon a dispensary must have experienced, as being easier prescribed than put in force, and hence it constitutes one great cause of the frequency and obstinacy of infantile remittent fever in the as the staple diet of the poor, viz., potatoes, present writer, to the disorder's aggression. remitient never attacks children at the with symptoms of mero disturbance of the breast, when the mother's health is good, first passages; sometimes under the slow speaks, I think, volumes as to the influence and fusidious form of marasmus, mattended of food in originating the malady. Indeed, their use, continued for a the constant use, in clothing, of flaunel, and few mornings, accompanied by general aperegular daily exercise, to be overlooked with rients, and succeeded by strict attention to suitable diet, often suffices in a very short Provided we were servilely to adopt the time to restore the little invalid to health,

The most incurable variety of the disorder characterized by the apyrexial and marasmic conditions; doubtless from these two circumstances,-the complaint having in too many cases made progress before professional damp habitations and improper diet con

of a mild blister over the region of the liver or a mind sing over the tayon or as they because attende with benefit. Many practitioners enterted to be spine, and over the abdones. There is no objection to their use, as this form of infantile remittent is unaccompanied by irritability; but I may add, after an extensive trial of them, that the present writer has not been able to realize the benefits others seem to have derived from their employment. The following case will illustrate the disorder's obstinacy, and inculcate a cautious prog-

In the month of May last, the child of a Mr. II., of Rochdale, atat. fourteen months, was brought to Manchester for my opinion. It had been under the care of two highly respectable and intelligent practitioners of that town, who had adopted for a considerable time every variety of treatment they could think of. The child's case was, though by no means an uncommon, an admirably · marked example of chronic infantile remittent fever. Upon the closest scruting, complaint's progress, and the child took everything, whether in the form of food or writer. Indeed, according to my general experience, if the means alluded to before, of medicine in this uppromising state of atrophy. Change of air, a generous diet, and cordials, may be tried, and in some rare instances they unexpectedly effect our object.

When infantile remittent fever assails plethoric children, previously in tolerable health, it is generally observed under the last alluded to, or entonic form. For this variety energetic measures are required, and their use soldom disappoints us. After the prima via has been well cleared (of which the practitioner should have ocular daily proof), by the persevering use of purgatives, such as senna, calonnel, jalap, scammony, &c. and the accumulations so often observed in this complaint, are removed, it is not unusual to find the child complaining of pain in some one of the abdominal regions. Its seat is very various. A few leeches, warm fomentations, and a succeeding vesication, ser the antimonial clutment, seldom fail in its removal. After premising these meait has been customary with me to the employment of a mercurial d. c. creta), combined with doses, of which latter affections of the

men mich of hitaffile remittent fever. In seknowledge irritability to be one of its most prominent features. On this account the addition of a little oplum to the evening mercurial, in most cases is accomp with benefit, with this proviso, that the tongue is disposed to be moist before we employ it. Occasionally however, as with the adult, onlim disagrees, and hypocyamis affords a good subtlitute. Enemata, throughout the whole of this mindly, are most appropriate remedian variet of course according to are, temperatures, and other attending circumstances. As one almost invariable ingredient therein, spirits of turpiontine will be found useful, as in a large proportion of instances of the malady, the fever is heightened and the irritation increased by the presence of worms. As soon as the pyrexial symptoms have declined, and not before, calumba, iodine, and cascarilla, may be employed, in forms as similable to a child's palate as possible, intermitting not, however, the morning use of some gentla aperient, which, during the whole course of no evidence of organic disease could be the disease (a period averaging probably detected; little pyrexia accompanied the three weeks), must be regularly enforced. Wine may now be found a useful auxiliary,

In conclusion, let me remark that the medicine, that was given to it; yet I am junior practitioner must not be surprised at not aware that the slightest benefit followed the occasional failure of his best-laid and the use of those additional remedies which most promising measures. The fretfulness were for some time employed by the present of the little sufferer, the perversity of ignorant nurses, the occasional impossibility of administering remedies by the mouth, and viz. very warm clothing, the hot-bath, mer- the natural obstinacy and dangerous chacurial alteratives, &c. fail, after a fair trial, racter of the disease, will, sometimes, but little benefit will accrue from a further use too successfully, combine to thwart and disappoint his wishes.

Manchester, Nov. 11, 1835.

HEMORRHOID IN THE RECTUM.

FOLLOWED BY

ABSCESS IN THE PERINEUM.

WITH FISTULA BECT! BTG.

To the Editor of THE LANCET.

Sin,- As the following case will, perha be considered to possess some practical in-terest, I shall feel obliged by its insertion in the moss of your land. the pages of your journal. I am. Sir. your obedient servant,

ROST. ROWLET CHEYNE. 57, Berners-street, Nov. 11, 1835.

Mrs. K., atat. 50, of a sullow complexion and spare figure, housekeeper to one of the West-end Club-houses, consulted me on the doses, of which latter 22nd of last August, for what she called the affections of the very under sensualding with extreme weak-Every one who pain in the calves of her legs, increased by Walking, or any exaction. "The had thes which were now of a livid red colour, hot, suffered during two months, and knew no cause for her complaint. The menstrual secretion ceased six years ago, since which time, until lately, she had been perfectly well. She had never, to her knowledge, had piles, nor passed blood by stool. The bowels acted regularly, and without pain. She had never had leucorrhou; her constitutional symptoms, when I first saw her, were not severe, the pulse being very little quicker than natural, the tongue only slightly forred, and the skin cool and moist. She experienced, however, much anxiety (which was expressed in her countenance), from the apprehension of permanently im-

This history, I must confess, induced me to consider the case as one of sciatica, and (acting on that idea) to recommend very moderate diet, gentle aperients, thirty min-Ims of Vin. Colchiel in Mist. Camphore, three

bath every night at hed-time.

This and similar treatment, continued still there existed a sensation of weakiness, perforem; to relieve which, another opening and, lately, of soreness, about the hips and was made, and a great quantity of pur perineum; and once, when at stool, a slight flowed out. pain had been felt shooting through the anus. From these facts I now hoped to obtain light enough to dispel the obscurity of the case. As I was aware that diseases connected with the rectum often assumed very anomalous characters, an examination per annu, was immediately proposed, with the view of ascertaining whether the present; was a case of that nature. The result was, the detection, about an inch within the anur, on the floor of the rectum, of the presence of a soft elastic hemorrhoid, of the size of et catap. a cherry, surrounded by some thickening and swelling, as if the coats of the bowel | days. Sloughing has nearly stopped; no were pushed inwards by fluid in the vicinity. The impression, too, of distinct fluctuation, was given to the finger, when foreible pressure (which gave no pain to the patient) was made by the other hand, on the perineum. All doubt being now cleared away, the proper practice was evident. The contents of the abscess should have been at deep cavity surrounding the intestine, lateonce discharged through a large opening, and then, in all probability, my patient would have been well in a few days; nothing, however, would induce her to consent to my request: she could not imagine the existence of an abscess without much more pain than she experienced. Under these circumstances nothing more could be done than to advise her to keep quite quiet, to take a teaspoonful of Elect. Senne every night, and to inject an enema of warm bottom of the abscers, and contin water every morning.

Thus the case proceeded turn the arrived found to communicate three places when I found suffering acute three places with the Thus the case proceeded until the 1st of pain in the perineum, the integrements of from the sites

ind swollen, and acutely to on presu and avoilen, and actually seem on pressure.
There was, diships in plantaness or expected, a
great deal of symplectics, hever. The application of twenty-four folithes was immediately ordered, and afterwards a warpouldie; and is the evening these measures were repeated, and an anodyne draught was administered.

The next day the pain and swelling wer's less; but there was more fever, and some difficulty in making water. No further opposition being now offered, a free opening was made near the anus, when more than half a pint of dark-coloured offensive pur, with bubbles of gas, escaped, to the surprise of the attendants, and with great alleviation of the severe pain and feelings of tension in the part. A poultice was then applied, and directed to be repeated three times a day, and an anodyne to be taken at hed-time.

Sept. 3. Has had a restless night; pulse times a day, and the use of the warm hip- 120; tongue loaded with a brown for; copious discharge, mixed with sloughs of cellular and adipose tissues. Complains still until the 26th, afforded partial relief; but of much soreness and distention about the

4. Has had a better night; looks less anxious; pulse 110; lowels open; no difficulty in making water; copious discharge, and the sloughing continues. Cont. medic.

7. Has been improving for the last three pain; less fur. Cont. medic. et catap.

The three weeks following the last report were spent in aiding the efforts of nature to repair the extensive mischief, which, as has been seen, was the work of only a few days. During this time the sloughing process had converted the incisions of the lancet into a rally and posteriorly, discharging at first an unhealthy pus, which, however, ho-proved in quality, in proportion as the constitutional vigour of the patient was restored under the use of tonics and good diet. Strong astringent lotions were also employed, of which those composed of Sol. Chlor. Caleis, and port wine and water, seemed the most effective. The stage granulation at length commenced at all, save a fixtulous canal up, which, when traced

id to, and f of the hemorrhite third close to the

As it was now or the first to waste principles of the many and the control of the operation, this man performed,—the incident dividing all the parts included between the highest opening into the Latentine and the anns. After this the granulating processors commenced, and went on until it reached the situation of the two other points of communication with the rectum; and now, instead of again using the knife (as the hemorrhoid could be readily drawn out with a hook), a ligature was tied round its base, including that portion of the mucous membrane in which the third small aperture could be distinctly seen. In three days the ligature came away during the action of the bowels, and from that period the case proceeded so well, that towards the close of the month Mrs. K. went into the country quite recovered, promising however, to continue the use of an enema of warm water officers to that obloquy which it morits, we twice a week for some time, in order to ensure the regular action of the bowels.

Remarks.—This case is full of interest. It lessness, that is, perhaps, unique in the shows the fact that large collections of mathamatical annuals of our medical institutions. shows the fact that large collections of mat-annals of our medical institutions.

ter may take place in the neighbourhood of The principal medical institution in Presheavily many many training treatment. Letches, claim to the honours and the fees of a physhich, undoubtedly, should be applied in large numbers, followed by paultices, relieve the pain, but do not materially retard the sloughing process when it has once commenced. Indeed, we can do little more, when the case has so far advanced, than support the patient as much as possible, and aid the escape of the sloughs as soom as they are loose; for these, lying in contact with the living structure, cannot fail to prove a source of irritation.

as in the above instance, in a passive man, and three honorary surgeons attached to ner, are perhaps connected with some cause the institution; and so the rules enjoined of obstruction to the return of blood through and the reports continually declared; but of obstruction to the return of many his property in reality, there were six general practi-mently coexist with piles. The surgeons afterwards found to their sur Cise that the other two physicians of the charity, Drs. Alexander and Norris, influenced by Dr. Moore's representations, had also come to the determination to sacrifice their word and consistency, to what they conceived to be their interest. Thus was explained a previous declaration of Dr. Moore, that he knew that there were medical men who would serve the charity if the number of its officers was reduced.

After such an instance of duplicity and deception, the surgeons considered themselves All taken from the nearest point. I am sorry bound, for the honour of the profession, to that I cannot at present add the population separate themselves entirely from the playsicions, and to act independently of them, bury, and Northfleet, are considerable. On They accordingly withdrew from the Insti- the forming of this Union it was at first possession, apparently to their great satisfaction. tution, and left the physicians in peaceful intended to make two divisions of it, and a which had been given them, and that they and medicines, in all cases, under the direccommittee and have an inspectarship ap-pointed over them.

Chalk, Denton, Ifield, Luddesdown, Moep-we regret, Sir. the necessity of this ex-lam, Northfleet, and Nursted (aithough posure, and disclaun all feelings of personal Gravescul, a large and populous town, and and so inexplicably mean as that which we parishes, not one medical man was found of the truth, assured that we shall have the disgraceful a sum; and, for the other divireprehension will be bestowed where it is Strood, one only offered from among about twenty in Rochester where the one resides) and its neighbourhood; and whether from necessity or otherwise, the guardians actually appointed this one for the whole I'nion, with the united salaries.

Now, Sir, passing by any observation on this sacrifice of professional respectability. this contemptible value for medical services, offered and accepted, I would ask what opinion must a humane mind form of the views and intentions of these " guardians, so called, of the poor, towards sick panpers? What must be the opinion of the poor themselves? It appears to me that had the " guardians" boldly advanced a resolution al eminently that medical aid to the sick poor should be as a Member; difficult to obtain, they could not have hit the rights of on a more effectual plan. In cases of fracto pour the turn or other accidents, hemorrhage or in-

flammation of the lungs, life may be lost by the very delay caused by having many miles to send; but even in ordinary cases of iliness, that the poor creatures should have to send or attend personally at so great a distance, seems a monstrous cruelty. I am told that the guardians think it best to have but one responsible medical officer, whom they require to be a legally-qualified prac-titioner, leaving to him the supply of necessary aid. But lo they require also, and see, that the aid a furnished, is that of " qualified" persons Can they expect the medical officer to expend so much of his paltry salary as a qualified person would have a right to expect? I think, Sir, that these are matters for the serious consideration of the guardians," ere a coroner's jury remind them of their duty.

In the furnishing of medical aid to the Unions in general, and to this Union in particular, one would almost he led to consider that the very lives of paupers were put in competition with a few paltry pounds sterling. Many other observations auggest themselves to me on this occasion, but the communication of Mr. Rumsey coming before me, and having reason to expect that his questions will be generally considered and replied to by the medical men in this neighbourhood, I shall for the present suppress further remarks on the matter, and am, Su sauther ticating my communication in a private note, yours truly

PRESERVATIVE EFFECT A BULLADONNA ATINA. ABAINST-ME

Some experiments with this medicine t were made on fifty-two children during an cuidemy of scarlatina, and though not on a sufficiently extensive scale to have much weight, deserve to be added to the number of those instituted for a similar purpose?

The extract of belladonna (2 grs. to an ounce of distilled water) was administered to fifty-two children, of from six months to fourteen years of age. Each patient took, morning and evening, as many drops of the solution as he counted years, and this dose was in some instances increased. The remedy was thus administered for the most part during five weeks,-the duration of the epidemic.

Of the fifty-two individuals forty-eight remained free from any attack, and four were affected with the disease. In two families, where the children commenced taking the remedy immediately on the disease attacking one of the family, all the children remained free from contagion, although they were in constant communication with the affected individual during the whole course of the disease.

In several cases 'Di the author remarked symptoms of the action of the belladonna a few days after its use; such as disturbed nights, slight inflammation about the throat, salivation, thirst, torpor, delated pupil, pain in the heal, comiting; and one girl, six years of age, was seized, on the 10th day after the first dose, with fever, pain in the throat, Hefeland and Ozon's Journal. - June and restlessness, and delirium. On the following day the whole of the body, except the face, became red, and was covered with miliary vesicles: this continued a couple of days, and then disappeared.

A boy, four years of age, who had taken the bella lonna for three weeks, became very uneasy and disturbed on the 5th of March; on the 6th this had passed off. On the 9th, the child, enjoying perfect health, was covered in all parts of the body, except the face, with a red eruption, which remained

A child, eighteen months of taken the belladonna sign ukin. The eruption w

on the second and the child was well on the fifth.

From the above experiments the author concluder:-

1. That the belladonna seems to have an influence in counteracting the contagiousness of scarlating.

2 That in some cases it diminishes the susceptibility for the contraction of the discase, though it does not altogether remove

3. That when the disease does occur during the use of belladonna, its character is much more mild than in ordinary cases.

4. SCIATICA CUBED BY OPENING THE SCIATIC NERVE.

In many cases (says Dr. Lowenhard, as the patient was nearly in a fainting con-the author) of obstinate sciatica, the cause dition, he took a restorative. of the disease is unknown, and all the remethose of the extremities; and M. Johert a few menths. years ago divided and removed a portion of. we do not at this moment remember what the result of that bold operation was. The cight days the patient recovered a good deal of strength; a considerable quantity of a following case, though not exactly of the grayish fluid, different from pus, was dissame nature, deserves to be recorded.

Case. - Mr. B. 38 years of age, of good constitution and sanguineous temperament, same discharge continued, the patient was was seized with pain in the region of the left hip-joint, in consequence of some violent exertion. The pain continued fixed for about two months, and then extended downwards in the direction of the sciatic nerve. After the expiration of aix mouths, the pain became so severe that the patient was unable to place his foot on the ground. He now demanded medical aid for the first time: various remedies were tried in vain, and he came under the author's care in six months afterwards. The patient was now much emaciated; the injured limb particularly reduced in size, and the heel so pain- from the joint itself. I that the patient could not stretch out his without aid, and had the most acute cord about the thickness of a

wowing down a dirty sediment. r some reflection the author conceived that perhaps the swollen nerve contained a watery fluid, as in the case mentioned by Richter (Speciel. There. part 2, p. 79), but how to give issue to this fluid was the question of most importance. A simple incision would easily have produced the desired effect, but it was necessary at the same time to impress a stimulus on the muscular system; the author therefore determined on employing the actual cantely, which was applied immediately to the nerve, where it passes between the trochanter major and the tuberosity of the ischium : on the iron being pressed with some force into the bottom of the wound, two to three ounces of a yellowish-gray fluid came away. The wound was then dressed with some mild salve, and

The day after the operation, the patient lies which are applied fail to relieve the with a very small pulse. Some stimulants patient from the dreadful and constant suf- and cordials were given. On the 21st same tering to which he is exposed. The effect state; the wound still discharges a little of division of the branches of the third pair fluid, and was dressed with ung. canthar. of nerves, has induced some surgeons to The pain of the foot has now changed into recommend a somewhat similar operation for a dull sensation, the patient slept a little recommend a somewhat similar operation for this night for the first time since many

22. Passed a good night; he can now the aciatic nerve for obstinate sciatica, but stretch out his foot without aid; the wound charged from the wound. The injured limb increased rapidly in size, and after a lause of some months, during a part of which the perfectly enred.

There can be no doubt, from several cases which have been published, that water may accumulate in the tissue uniting the medullary filaments which compose a nerve, nearly in the same way as in hydrocephalus. The author is inclined to attribute both phenomena to a similar cause, namely, chronic inflammation. In the present instance it scens probable that the capsular ligament of the hip-joint was also involved in the disease, and that the quantity of fluid subsequently discharged was in part furnished

5. THYMIC ASTUMA.

The attention of the profession, says Dr. under the skin, in the Hirsch, of Konigsherg, was first drawn to merre, which was this peculiar affection of children, in the chancur; this part year 1830, by Dr. Kopp, who gave it the the the touch; the name of "Asthma Thymicum;" since then the urine deep red, several interesting observations have been 2.3

made by the German physicians, of w the author of the memoir new before as

gives an ample reservi.

Asthma Thymicum, or, as it is more generally called in Germany, "Kopp's asthma," attacks children between three weeks and nighteen months, but prevails most between the fourth and tenth mouth. It is characterized by accesses of spasm in the air-passages, and genoral frritation; the respiration becomes suddenly suspended, and we ob serve only a whizzing, very fine, small, and imperfect inspiration, an embarrassed passage of the air through the rima glottidis, highest degree. The tone has a certain analogy with the crowing inspiration of nate; and now, even when the child is free tions, and which resemble the tone in a very set, he is carried off suddenly, as if by nervsevere degree of croup: in the most danger—ous apoplexy, without asthma, râle, or any perceived only at the commencement of the other children. paroxysm, being immediately suspended, to On examination of the body after death, gether with the breathing; or on the cessarian we find a blue colour of the skin; congesor when the attack has been very violent, peculiar "chlous-looking" fluid. In the cases that the child remains for some time pale, where the gland was weighed, a good deal flaccid, and with a tendency to sleep. In the of difference was observed. and constitution of the child.

Several physicians have endeavoured to act immediately on the enlarged gland, by the administration of anti-scrofulous resolvent medicines (and apparently with much success). as mercury, digitalls, iodine, &c. Twenty years ago, A. Burns proposed to extirpate the gland by making an incision in the anterior part of the neck, between the sterno-hyoid muscles; the finger was then to be worked down into the chest, between the starious and gland, and the latter removed with the aid of a polypus hook; but this operation has never, as one may well conceive, been attumpted on the living body. The following case, selected from amongst those published at the end of the memoir. will serve to give an idea of the progress of the discase.

CASE .- Victor V. M., twelve months old, suffered at an early period of birth from diarrhea; this however soon ceased, and the child became healthy; when, at the age of five months, he was seized with chronic bronchitis; from this time the mother remarked a symptom which she had not previously noticed, viz., that the infant on awaking from sleep, or immediately after, had the respiration suddenly suspended; the attack however som went off, and was generally mild in the commencement, but after the lapse of some time the paroxysms became more severe. The breathing was now completely suspended, the face expressive of great auxiety, pale, or at times purplish, and the body conculsively bent back. wards. After one or two minutes the child recovered from the attack, drew a few firm deep inspirations, and then uttered some sharp cries, after which he became gay and apparently well. The nature of the disease was evident; leeches were applied to the breast, followed by a blister, and small doses of calonicl with rhubarb were administered.

This treatment at first recented to be attended with benefit; the puroxyans were suspended for a week, but soon returned with increased violence, even every one or two hours; musk was now given without any amelioration, and after a lapse of eight days the child was carried off in a fit of suffocation, without any general convulsion.

The body was examined thirty hours after death.—The thymns gland was remarkably enlarged, and filled the whole of the anterior mediantinum; from the middle of the gland a process was sent off, which closely embraced the common jugular vein; the substance was very dense, and it weighed ½ drackms, or 570 grains. The right lungwas venarkably compressed, byt going in struc-

tere. The appearance of the heart was normal; the right wantiele was very soft she left was the foramen ovale was closed. The head was not aranimed.

managament to the terminate of the contraction of t

On Dropsies, connected with Supp. cased Corspiration and Congrabile Princ. By Just a THAN OSBORNE, M. D. Loudou: Sherwood, 1835, pp. 61.

THE condition of the prine has received less attention from the Scotch school of medical writers, and from all the theoretical schools of the continent, since the time of lieffman. than its importance in pathology and in practice would warrant; partly owing to the horror of humoralism prevailing, and partly in consequence of the want of good chemical tests of its constituents, or to the exaggerated views with which certain ignorant empiries and mountebanks choose to minical the community. The orthodox practitioner could not but treat the glass with disdain in which the quack had pretended to see the disease ; and, " to cast " the fortune of his patient; and to avoid giving occasion to adious comparisons, he could unreluctantly abandon signs which have know scarcely how to ecceptise, much less to interpret, - overbooking there very critical points on which Hippoceates, Galen, and the ancients, made the whole course of discuses to large; for, unfortunately, the authority of the ancient Greeks, and the light of their genius, were hidden from the earm maity amongst us, by their works not being translated, as was the Bible, into English. Cullenists, Brownists, and theorists of every class, found it easy, in the last century, to divert the profession for a time from those extensive and easily-discerned changes in the accretions which the aucients had signalized, and to direct their attention only to the beatings of the pulse, to the tongue, and to the extreme vessels.

The investigations of chemistry, applied to the uriue by Berzelius, Prout, Marcet, and others, have already become of practical importance; the presence and the proportion of uren, the phonphates, but augar, deserve in many cases without than any other sympathology is more attributely be found about a stion.

dropsy, and coagulating in the urine when i desect in size, and become hard in proporexposed to heat, was first detected by Dr. Wells. Dr. Blackhall milds further observations, and confirmed the announcement of Wells, that in a great number of dropsics, in which the urine congulated by heat, there was evidence of inflammatory action, and the in such cases, bleeding was productive of very marked benefit. Dr. Crampton recorded some cases in the "Memoirs of the Dublin Medical Association," to confirm the evidence in favour of bleeding. The inquiry rested at this point until Dr. Bright made the striking observation, that coagulable urine was connected with a diseased state of the kidneys. Drs. Christison and Gregory shortly afterwards published eighty-seven cases, and amongst those, the granular deposit in the kidneys was always detected when examination after death took place. Dr. Osborne has, in the volume before us. presented the results deducible from thirtysix observations, so that the evidence relative to this disease seems now sufficiently extensive to positively determine its nature. ney, and professes only to have been concated by him, we proceed to notice.

Dr. Osborne has described the appearance of the kidneys very succinctly and clearly.

"When an injection is thrown into the strery, even in the most successful manner, point: and which she become more firm The cortical portion of the kidney is the lability are signified by its not taking place times find is an in the lability are signified by its not taking place times find is an in the lability are signified by its not taking place times find it filling up, and encroaching so much on the other part, that the tabular portion is limited to small, insulated portions; and in these cases the tubuli increase in density, and become more confused together, the nearer they approach their termination in the mamiflated processes. In some of the most acute cases I found the lining membrane of the pelvis and upper portions of the uterus in a state of the vascularity, resembling crimson the changes produced on the sixe remarkable, and in my follow this rule,cases, the kidneys natural standard; cones spea sie te-

tion; the cortical structure appearing to be removed, and replaced by the gray deposit.

The smallest quantity of albumen is detected by the bi-chloride of mercury; but when this is used the urine should be acid, or many of its neutral salts will be precipitated. From frequent observation, we can declare that the acid urine of healthy persons, particularly when they have been taking severe exercise, yields a precipitate with this delicate test; and when influenza was last prevailing in London this precipitate was unusually shundant. Nitric acid, when there is more albumen, is a good test. Heat coagulates the albuman only when it exists in considerable quantity: when, therefore, the urine is said to be albuminous, it is quite necessary to state what tests have been employed. Da Osborne remarks, that .-

"The examination of the urine in this disease must be conducted according to one fixed rule, otherwise we shall constantly meet with apparent contradictions. The urine should be that which is passed in the Still, so difficult is " judgment" in pathology. morning before breakfast. It should not be that the relation of dropsy to the granular examined till it has couled. It then is condition of the kidneys is by no means yet insually of a pale citrine colour, simi-transestablished. Dr. Osborne was prejudiced parent or translacent, but not transparent against the opinion of Dr. Bright, in connecting congulable urine with diseased kid-vessel there is an opake, whitish cloud, consisting of the immers of the miner of the sisting of the mucus of the urinary passages, and differing from healthy mucus by its verted by the force of facts, some of which, greater density and opacity; while in other with the modification in the treatment advo- cases it differs from the healthy state by containing no mucous cloud. On heating this arine, in a spoon, over the flame of a candle, white congula are formed in those portions of the fluid next the metal, long before the heat has advanced to the boiling till the fluid has boiled, or till some of it has been evaporated; by no congula forming, and the fluid being rendered merely turbid; and, hastly, by throwing up a froth when boiled, which appears to be produced by the amallest quantity of albumen that can satisfactorily be tested by heat. I may here mention, incidentally, that I use this mode of examining urine in other diseases beside dropsy, and without any expectation of meeting albumen."

The proportion of ures, and the specific gravity of the urine, are diminished in this disease. The quantity of urine is not much altered.

Is congulable urine invariably the result

and sign of a granular, morbid condition of the most general cause of the disease. Supquestion in the affirmative, and animadverts very fallacious terms, with some severity on those who think further observations are required. He states collateral circumstances of all the other cases, led to the same conclusion :-

"The negative evidence in my possession is too copious to be detailed. It is, however, decisive as to the question at issue. It! which the kidneys were healthy, and the iously sought for every opportunity of examining the kidneys of every individual in whom the urine had been examined during life; and in up one instance have I met with congulable urine without diseased kidneys, or healthy kidneys with coagulable nrine.

Dr. Osborne has laid down two propositions, between which there seems to us to be some discrepancy. He calls this discree renal dropsy, and thereby seems to assert that the disorganization of the kidn-y-of the secreting gland - is the cause, the source of dropsy, - accompanied by coastable prine. An alteration in the secreting gland will doubtless account for an alteration in the properties of the secretion; but an aiteration in the fluid from which the secretion is eliminated may also account for an alteration of the secreted product, and effect the precise change in the kidnay described by Dr. Bright. If, as Dr. Osborne contends, dropey with cospulable urine is attributable to suppressed perspiration, it inevitably follows that a change in the proportions or nature of the constituents of the blood precedes the disease of the kidneys, and that course on mecane or one kidneys, and that peared to agree best with the individual this afternation of the kidneys is an effect of case, at hight at the hour of going to be a state of the case, at high the case of the case, at high the case of th the modified finid which those organs se- The patient also took at night eig crete.

Dr. Osborne's system of treatment is employment system founded on the assumption that the "con-yearsy he less lightly tinuous suppressed perspiration," which he to resulte he were proposes to denominate "Anidrotis," is journal paredient.

the kidney? Dr. Osborne answers this pressed perspiration, we tally remark, is a ay indicate two entirely different states of the cutaneous surface; for in popular language it merely that out of thirty-six cases, nine autopsies denotes dryness of the skin; and this state evinced the disease of the kidneys in every of the skin may arise from its temperature instance; while the symptoms, causes, and being a few degrees higher than usuall or from the fluids with which it is saturated having less elastic force. But the practice of Dr. Osborne appears to have been remarkably successful, and the results alone -independently of any theoretical conconsists of numerous cases of dropsies, con- sideration whatever-decide on the merits nected with diseased liver, impediments of of a therapeutic system. Of the 80 cases lity, which terminated fatally, in which the treated by Dr. Gregory with disretics &c., urine was examined before death, and found 45 died; of 36 cases treated by Dr. Os. not to congulate, and the kidneys were found borne, only nine terminated fatally; in the to be free from disease; also cases ending one series 56, in the other 25 per cent. fatally, but unconnected with dropsy, in perished: a proportion very favourable to the latter treatment. The numbers are not urine did not congulate. This evidence sufficiently numerous to furnish exact data appears to me peculiarly valuable, inasmuch of the absolute mortality of this disease when as during the last three years I have any of the absolute mortality of this disease when under medical care; but 51 deaths in 116 cases,-46 6 per cent .- is a high mortality, which would place the dropsy nearer to diahetes and phthisis, than to fever or inflammation. Bleeding, purgatives, and other remedies, were employed in complicated or obstinate cases; but Dr. Osborne thus describes the most essential parts of his treatment : -

"When a peri at was placed under my care, with general a Joun, congulable urine, and dry skin, I directed him to be kept in bed. in order to main ain warm hed the surface, which is usually disposed to be cold. It has happened frequently that, by external bent clion, an improvement both in the quantity and quality of the usine, and a material subsidence of the adema, have taken place. The first me licine ordered was usually a purceative; and in the choice of this, in order to avoid ambiguity as to its mode of action, I abstained from the use of all those articles which are reputed discretic; such as compound of jaiap, or supertartrate of potach; and I generally employed the scuna mixture. I then commenced a diaphorate course, by administering foor-baths, hipbuths, or general baths; the last either of stater or of vapour, according as they ap-

of Puls. Jacob. par. 4., 61 Puls. Tot ing Confeet, Aromet!" Opie, and 10 gra

We have read Der Osberne's elegantlywritten book with much pleasure, and do not doubt, from the new and interesting facts which it embodies, as well as from the instructive manner in which the subject of the Beense is treated, that it will shortly be in the hands of all who take an interest in medical discovery. On this account we have freely stated whatever objections we consider to lie agains: Dr. Osborne's theoretical views; while we have detailed the result of his observations and experiments in the pathology and therapeutics of those dropsies which are accompanied by coagulable urine, and connected with disorganized kidneys.

THE LANCET.

London, Saturday, November 21, 1835.

of Medical Reform made some progress- calling general attention, by personal apwe are at least assured that it made much peal, to its examination, is a meritorious one, noise-in the Irish capital during the week we cordially concur in the favourable estipreceding the last. On former occasions this mate which we hear was formed by his subject has always been touched by the Pro- auditors of the manner in which Mr. ELLIS fessors of Dublin with a degree of delicacy dist harged the duty he had undertaken. But and reluctance which attend the handling of if our report of the lecture be correct, we a dangerous topic. The speakers seemed to cannot state that we think his enumeration feel as if some fatal catastrophe was neces-, of medical abuses was so comprehensive as sarily involved in its discussion. ment think, the temerity to announce his intention by public advertisement. No serious consequences, however, of which we have heard, have as yet followed the rash undertaking. He not only survived the exposition of a multitude of medical abuses in the medical institutions of these countries, and of absurd enactments in the statutebook of medical law, but, strange to say, he was cheered throughout his statement of the case of reform by a numerous assembly of students and practitioners. It is surely a step gained, in Ireland, in the progress of the question, to convince, by actual experiments, the hypochondriacal advocates of improvement in Dublin, that there is, after all, nothing dangerous in the entertainment of a topic in which mere reason and evidence are combined. To Mr. ELLIS are the profession in that quarter indebted for the disl coverv.

So far, therefore, as the act of divesting Jenging by appearances, the question the theme of its imaginary horrors, and of reach this hazardous subject appears to be unjust. Yet upon these two important items a discourse recently delivered in in the catalogue of medical abuse, no opidishment to which he be- nion was given in the oration of Mr. ELLIS. discussed the lead- In these omissions, which we presume were but had, as accidental, he was neither just to himself contemporaries nor to the question which he derigned to

In the question now at issue

MIRTITUDINOUS have become the coma plaints relative to the " new arrangements" for providing medical attendance under the Poor-law Amendment Act. The letters which we continue to receive on the subject are needly all directed against the conduct of the Commissioners who are sitting at Somerset House. In this wholesale condemnation of those gentlemen there is manifested very considerable thoughtlessness. and no inconsiderable portion of injustice. In the last session of Parliament it was distinctly stated by Lord Joun Russell, Secretary of State for the Home Department, that the subject of providing medical attendance for the sick-poor, should receive the immediate consideration of the commissioners, and, very soon afterwards, Mr. Hopoges, the Member for Kent, and a deputation of medical gentlemen from that coun-Lewis and his colleagues, that the Boards tive to the medical contracts, is minted by to state that so far as the Poor-law Commisrously exerting themselves in the rural dis- in the newly-created Unions, has been tricts, would attempt to infuse into the discussed with much perverseness of judg-Boards of Guardians, some feelings of huma- ment, and, in some cases, accompanied by nity towards the poor. The names and evident signs of factious malignancy. addresses of the members of the Boards of Guardians who have made some of the infamous contracts which have been so justly e which was given by ers to Mr. Hopors has been broken,

RUSSELL have been falsified, public indignation, instead of being directed towards the Home Office and Somerset House, ought to fall, with undiminished weight and severity, against the merciless Boards of Guardians who have attempted wilfully to sacrifice the poor, by withholding from the wretched sufferers, efficient medical skill, and even necessary medicine, in the hour of sickness, It must be admitted by every impartial person, that in carrying the new law into operation, the Poor-law Commissioners are placed in extreme difficulty. The Poor-law Amendment Act is an unpopular measure, -in our opinion most justly so, as we certainly consider it to be one of the most harsh enactments that ever received the sanction of a British Legislature. It is next to impossible, therefore, that those gentlomen can take a step, in any direction, without giving offence to a large portion of the community. It will be recollected that one great complaint against the new law was, ty, were informed by Mr. FRANKLAND that the power of managing their own funds was transferred from the rate-payers to the of Guardians in the respective parishes, had nominees of the executive Government. full power to contract with as many medi. The objection was founded in truth, and it cal men as they thought proper, and on was correctly and constitutionally urged. such terms as they might consider that the But the Commissioners, in relation to the interests of the poor demanded, in the parimedical contracts, have entirely obviated tishes in which the Boards exercised their such an objection by allowing the Boards of functions. On whom, therefore, ought the Guardians to make their own contracts for censure to be thrown, if the contracts are medical attendants. Really we are bound traits of odious cruelty, it would be well if sioners are concerned, the subject of prothe writers and observers who are so gene- viding medical attendance for the poor

As the experience of one year has made it but too apparent that the Boards of Guardians cannot be safely entrusted with the aped, should be forwarded to us medical care of the sick poor, the Poor-law Until, however, it can be Commissioners could not be censured if they were, henceforth, in all new contracts, to withhold the management of that department from those bodies, and retain over it is by Lord Joux their own uncontrolled authority. Though

the saving of a few pounds in the 2 the Boards of Guardians may induce them to make disgraceful and brutal contracts with low-minded medical adventurers, the Poorlaw Commissioners sitting in Somerset House cannot possibly be influenced in their conduct by any such unworthy and sordid motives. The interests of those gentlemen are of a totally different character.

Another article by Mr. Radley, on the treatment of fractures of the bones, without the employment of splints or tight band. ages, will be found at page 283. The subject is one of deep and pressing importance, as we are given to understand by Mr. RADLEY that the non-application of splints to fractured limbs is attended with an inconceivable degree of case to the victims of the accident. When, therefore, it is horne in mind that the great object of cultivating the science of inedicine is, in every instance of disease, to diminish the measure of human suffering, nothing but prejudices of the most odious character can prevent the system practised for so many years by Mr. RADLEY, from being brought into immediate operation in our public hospitals. In again adverting to this interesting subject. we ought, in justice to that distinguished surgeon Mr. WARDROP, to place before our readers the following sentences from a clinical lecture which was delivered by that gentleman and published in Tur. LANCEY of Oct. the 4th, 1834, page 55:--

show that splints, bandages, and the complicated mechanical contrivances usually employed in the treatment of fractures of the thigh-bone, are not necessary in all cases, and may sometimes be altogether dispensed with.

The injurious effects which are producted by the use of splints and handages in the treatment of fractured bones may frequently be observed, and I am convinced that in many cases and under many circumstances they may be well dispensed with."

"While splints may no doubt be often employed, at least without mischief, there are, on the other hand, cases wherein they are decidedly hurtful; I allude to those in which the soft parts adjacent to the fracture are so injured or bruised that the pressure of bandages or other apparatus becomes a source of irritation, and thus creates more or less inflammation, which, instead of promoting the reunion of the fractured bone, length,

at proc save known a time soft alon a from this a

In fractures of the ver limbe I would therefore strongly urge surgeons to consider in what cases or under what circumstances splints and bandages are requisite, —in what cases they are hurtful,—and when their application is nugatory. If the fare not decidedly necessary, or considered improper, it is of great importance to attend to the kind of bed on which patients with fracture are to be placed, taking capacial care that it is one plane surface, placing a dossil of tow to fill up any inequalities, such as that in the ham or at the heel, preventing the smallest exertion or muscular action being made by the patient to support the limb, and thus allowing the fractured member to be in a perfectly quiescent state.

"This simple mode of managing a fractured limb has also the advantage of admitting the ready employment of leeches, or such other local applications as may be requisite to subdue any fallammation at the scat of injury."

COLUMN CONTRACTOR OF THE

Tax Conneil of the University of Landon, . on the requisition of a numerous body of the proprietors of that institution, have anpolated a meeting of the shareowners, to be held in the first week in the ensuing month. The chief subject to be considered by the meeting is, the charter, which, it is understood, the Crown is willing to confer, with certain restrictions in the conditions. As we take a very deep interest, on purely public and national grounds, in the continued success of the University, we shall "The subsequent cases are intended to book forward to the proceedings at this meeting with considerable anxiety, and not without some degree of apprehension. The institution, so far as the medical department is concerned, has become so firmly established, and has taken so bold and successful a stand,-far out-topping, in celebrity, every one of the "recognised" establishments connected with our endowed hospitals, - that it is now clearly evident that no charter, or extrinsic aid of any kind, can increase the unility, or add to the reputation, of the University medical school. The best socurity for the continued prosperity of least this branch of the establish be found in the talents and professors.

In the next Lat roposed object of

ARREAGEN TOR PRACTITIONERS IN THE COUNTRY The Marchioness of Londonderry, who is in a delicate state of health, will, it is expected, shortly visit the metropolis for the benefit of more skifful medical advice."-Sunderland Herald, November 14

is really surprising that the intelligent conductors of respectable country journals should introduce such trashy paragraphs into their columns. There is scarcely a town in England which does not contain practitioners in medicine who are equal in ability to those who are styled " first-rate practitioners" in the metropolis. When operations are requisite, we admit that the patient is safest in the hands of that surgeon who is frequently called upon to use those appropria of medical practice, steel instruments; but in cases which require no such aid, the sufferers would act wisely in not relinquishing, on slight grounds, the pure air of the country.

ROYAL MEDICO-CHIRURGICAL SOCIETY.

Tuesday, November 10th, 1835. Mr. EARLY, PRESIDENT.

MORNIO VASCILARITY OF PARTS

This Society commenced its first medical soirce for the winter this evening, and was numerously attended.

ings, was directed by Dr. J. Yellouv to in rising, however, was simply to prevent the subject of the vascularity of mucous the discussion from dropping. and serous membranes. The author in ; his communication,—and in this consisted rose to prevent its continuance, for as it its substance—considered that the pre-seemed that the profession knew not what sentation of a vascular appearance in any inflammation was but judged of it only by dicate the existence of infammation, as swelling, and pain, the could not consider reddened appearances might exist, with that the paper which had been read tended tion, and in order to show the fallacy of no detectable morbid change. appearances, the Doctor exhibited a draw-Mr. Mayo could not agree with Mr. Amott in his view of the discussion. Al-

of vacquiarity, the

should be paid to the position of the body, because vascular fulness in the dead subject is exceedingly delusive; and there will, moreover, he found various degrees of vas-cularity, which, as in the example presented,

are simple cases of turgescence.

Dr. Weathernead considered that this important topic ought not to be allowed to pass by in allence. That a turgescency of vessels was not a sign of inflammation, he readily admitted. But the difficulty was first, how is the effect to be explained? and secondly, how were the true and unequivocal signs of inflammation to be described? How, for instance, came blood to be accu-imulated so largely in the heart, when the bloodvessels are themselves, comparatively speaking, empty? Did not the circumstance move that the vessels had the power of propelling the blood onwards, after the heart had coased to beat? He therefore regarded the turgescency of vessels in mucons tissues, to arise from the weakened state of the vessels, situated as they were remotely from the centre of the circulation, as compared with those vessels which were more advantageously situated for propelling the blood onwards.

Dr. CLENDINNING agreed with Dr. J. Yellowly, that the turgescency of vessels in most instances occurred simply from the position of the body, and in such case must not be regarded as proofs of inflammation having existed in those parts. He had seen, at coroners' imprests, this state of the vessels adduced as a sign of inflammation, the ver-Attention, at the opening of the proceed, i diets being founded accordingly. His object

TEMOUR ON THE SCAPULA.

in THE LANCET lately. The details of the case ran thus in Mr. Earle's paper: - James Jackson, admitted September 10th, 1835, into St. Bartholepartnok of every motion of the scapula, and ; the treasury. was evidently in close contact with the bire. The man's aspect was bloated and unhealthy, and he had been a free liver. Leeches were applied and the arm was supported in a sling. Several consultations were held, as to the propriety of removing the tumour with the knife, but unfavourable opinions of the case were formed, and it was deemed not advisable to operate, from the probable malignancy of the tumour. Mr. Earle, however, was of a different opinion, which he founded on the perfectly healthy condition found necessary, the scapula should be a serious aspect, and went on increasing, taken away also. In the course of the oper and the portalities, dreading the edicts of ration, the tumour was found adhering firmly a second operation, neglected to apply for to the inferior angle of the bane; but the relief; and from the incapability of following remainder of the transur was easily deshits employment, he became reduced to a only a small spicula of bone was found no extended up to the grain. The left atm cessary to be taken away with the fore µs. particularly) and the left leg were new Two arteries were tied. After the removal redematons; the pulse 120 and facility and man left the hospital, on November the 4th, night in the workhouse, but nourishment and had since regained the use of the arm was then too late, and this nouring he discrept shelfactorily. The case, the report went. He (Mr. H.; considered the case to well on to say, was valuable in a practical point illustrate the proposition laid down by Mr.

Partridge had informed him that there was other disease was detected in an appearance of the partridge had informed him that there was other disease was detected in an appearance of the partridge had been appearanced in a side of the cheer; the to be able to continue the "Transactions,"; as in most persons of the keeping up of which constituted the themselves up as the

pride of the Society. At the commencement The Secretary (Mr. Partridge) then read of the sessions, invariable actuality of subarreport of a case in which a large tumour jocts was complained of act at the terminawas removed from the scapula by Mr. Earne, some account of which was reported Society to call an additional meeting. He, however, had to congratulate the members on its present flourishing auspices, for no session before had presented so many highly September 10th, 1835, into St. Berthole- respectable names of greateness who wave the left scapela, suffering from a tumour of desirous of becoming follows of the Society, the left scapela. Dr. THOMPSON argued that it depended found the disease invariably to return after in great measures as to the soot becoming operation, for he had heard Mr. Travers re- absorbed and affecting the system/whether muck that it invariably reoppeared.

Mr. Jones did not regard the disease of to carcinomatous affection. In ordinary Mr. Hooves aid, that this man was perfectly free from other disease in all the visition should be severally avoided. In contrast, the other than the several s cera; but in other kinds of carcinoma, the roboration of his statement, Dr. Thompson Proper nourishment last year would have well, and led from his avocations an active prevented his life from being shortened by life. The man left town to visit his friends, the disease. The pains were lancinating, and it would seem that from the change to a state of inactivity, a torpor of the bowels followed, which aperients failed to relieve, Mr. DENDY thought that had the man and the man died. On inspection of the lived longer, the disease would have produced body, a tumour, decidedly of a scirrhous greater ravages in the system. He thought nature, was found at the termination of the that some modifications of the disease might colon. The caliber of the intestine did not occur in all parts of the body. How far exceed the diameter of a quill. The disease snot could effect a change in the houes he was not developed in any other organ, thereknew not, but he could not believe that its forc he wasted to the conclusion, that if the necessity of having recourse to the aperients A GENTLEMAN, whose name we could not had not been compulsory, and produced irrilearn, regarded the disease as local, but ca-tation on the immediate seat of the disease, table of being easily excited. This gentle the part would have remained quiescent, and man was led to relate a case of hemorrhage the patient's life been prolonged. The Docin a chimney-sweeper from the stomach, for related a second case in support of his to the extent of seven pints, which proved position, that of a man aged fifty years, who fatal after a second attack, when the sto- felt tolerably well, but suffered from vomitmuch was found converted into a diseased ing, which led him Dr. T. to treat the dismass weighing sixteen pounds. A second case as a thronic affection of the stomach, tase was related, which consisted of a small Becoming, shortly after, more fully acspot by the side of the perds. The patient quainted with his sufferings, he .Dr. T.) consulted Sir A. Cooper and Mr. Abernethy, was led to conclude that it was of a cancer-Abernethy observed, as it was a partion of fully with this impression, he found several malignant tumeur, that somer or later the tumours about the size of a pea, adhering circulation would become affected. The to the skin of the arm and scalp. Attempts penis was removed, but the patient deed, to allay the vomiting failed, but afterwards he should get well. About one month after, Mr. Joxes, after making a section of the he rose from his hed to micturate, then suf-

Mr. DENDY believed, that if the records would tell us that almost in every instance the disease returned again, after the operation for capeer was performed. He did not look upon soot as a common irritant, for it failed to produce the disease in many parts of the system.

TUBERCULATED DISEASE OF THE UTERUS. Mr. Bayant rose to give the particulars

n which he had plisted a individual from whom the mor sen taken, had not fallen un ect of the case, a lady, The sub The subject of the case, a lady, I, aged fifty-two years, was of are and spare habit, and had for s years suffered from indigestion, acaied with headache and singgishness became " irregular," and about eighteen knowledge, where iodine had been appli months ago the catamenia ceused altogethad increased the tumour in a very short ther. She was next troubled with vonding, period to double the size it presented when about half an hour after taking any food; the iodine was first used, a hardness was felt on the right side, and Mr. Monar, in order to counterbalance she became emaciated. Latterly, she sufcreased, diarrhess followed, and she died on the disease, and kept it under control. the 30th of October last. Several weeks weighing five grains; when dried it was of sible condition. a bright colour, with a tuberculated surface.) The Parsons to previous to the adjourn-The uterns had undergone the change ob-sment, requested to relate the following case: served in the preparation, but this change .- A lady, who was extremely pullid, and was not suspected, as the attention of the labouring under all the characteristic sympmedical gentleman Mr. Hiff, was not distrement of a severe constitutional disease, was rected to it by the patient. The case was suddenly attacked with suppression of urino, interesting, from its adding confirmation on which was found to arise from the mouth of an important topic, that a disease of a the womb pressing forward, as as to preformidable nature might go on even to the vent the urine from flowing. The uterus destruction of life without being suspected, was tilted back by the practitioner, and and in which no symptoms are manifested, a catheter was introduced to draw off the either to lead to a detection of the disease, accumulated fluid. The mack of the merus or suspicion of its existence.

The PRESIDENT asked whether the thickenlog of the pyloric orifice of the stomach, was of a cancerous nature.

nion led him to that conclusion, although the thickening was not great.

Mr. Moore was opposed to the opinion that the disease was of a tuberculated nature; he regarded it as rather of a scrofulous kind, and his judgment was supported by the accounts of the French pathologists. M. Louis had recorded, that of upwards of 300 cases of disease of the womb, only one of tuberculated disease of the uterus existed. He (Mr. M.) was led to this conclusion from the nature of the inflammation (not having examined the preparation very circumspectly), which was of a chronic kind, and unattended with pain.

Mr. Carer thought that the time of the acnt the lady was sciety might be spent more profitably, by lociety might be spent more profitably, by considering the relief of parients at the early | dered nuneces

ANTIMONY IN PRECMONIA.

Dr. Annison requested the sense of the Society respecting the efficacy of the anti-

monial treatment in pneumonia.
Dr. Jounson considered Dr. Addison, as an hospital physician, best calculated to give an opinion on this treatment. In pulmonic inflammation, he (Dr. J.) had pushed the antimonial treatment further than in any other inflammation, but would not trust exclusively to it. The use of the lancet he regarded as highly necessary and beneficial in weakening the action of the heart and arteries in inflammations.

Dr. Appraon replied that he did not allude to antimony, when used in combination with other remedies; for, in the ordinary use of antimony, calonel and opinus gene-rally were combined, and not unfrequently

A The close that a co drawn up by sons sion (not confined to the by Mr. Headland, the merciary of the Society, which it was attended should be ented to Mr. Kingdon, after it had been ed by as many members of the medical profession as accorded with the originators. that his conduct had not in the slightest degree merited the stigma cast on it by the Council of the College of Surgeous; for this reflection, as Mr. K. professed it to be, on his moral conduct, preyed most heavily on his mind,

preceded by the use of the lancet. But the that occasion, found that only disadvantreatment that he referred to, was the trust-tageously checked the disadvanting to large doses of antimony to the exclu-that by first bleeding the distinct, as much in company with a general practitioner, great benefit derived from the treatment, and he was unwilling to interfere with the remedy that was producing such beneficial results. It was persevered in, and it quickly effected a speedy and complete cure. What he (Dr. A.) looked upon as constituting the tering from half a grain to a grain of tartaremetic in solution every one or two hours. The first and second doses probably produce vomiting, followed by nausea and free diaphoresis; and he would ask whether we were not justified in abstaining from so harsh a remedy as mercury, and adopting antimonial treatment in preference, at least in the milder forms of inflammatory disease. Of late he had had reasons to doubt whether pneumonia was so severe as it was formerly taught to be. They used to be led to believe that it was a most serious and fatal disease, seldom admitting of cure. Cases had occurred within the last few years which had led him to doubt the correctness come under his observation, where the disthe majority of cases, were injurious, and some untoward accident. smaller bleedings as by far more safe and more appropriate.

school was certainly in favour of the anti- Mr. W. had found, that if the inflammamonial treatment, and that the rate of mor- tion was first attacked by a full bleeding, so tality under its use was not more than one as nearly to produce syncope, and then fol-in eight cases. This calculation was made lowed up by large doses of antimony, the from cases of the serious kind, and after latter had proved a most valuable remedy moderate bieedings had been used.

Mr. H. Jounson remarked, that during the time he was at St. George's Hospital, several cases of pneumonia were admitted, in which the antimonial treatment had received a fair trial; but from the result, it was considered to be an inefficient remedy. If a preference was to be given well acquainted with the use of merenry, for even Andral was only now beginning to was found to have taken place, and the regard mercury as a powerful remedy. He lymph through which the adhesive process differed from Dr. Addison as to the mildness was maintained, presented, from evaporaof pneumonia. He (Mr. J.) had found it tion of the serum, the same phenomena in any thing rather than a mild form of disease in the surgical wards of St. George's.

Dr. Jounson remarked that in 1812, an ample opportunity was afforded for experimenting on pneumonia in the Scheldt, when that disease attacked almost every inwhen that disease attacked almost every in-dividual there stationed, and the medical officers employed under government on do the disease.

sion of other remedies. He (Dr. A.) was as their strength would admit, and then induced more particularly to give it a trial, exhibiting calomel, only in sufficient doses from having seen in a severe case of laryn- to act on the secretions, more benefit was gea, which he had been requested to visit obtained than by any other kind of treatment.

Dr. Addrson still maintained that prinmonia was not so fatal as was generally conceived. He thought that Mr. Johnson was particularly unfortunate in selecting cases from the surgical wards of an hospital, to illustrate cases of genuine idioantimonial treatment, consisted in adminis- pathic pneumonia, for he (Dr. A.) was not a stranger to that division of our public institutions. There pucumonia would either be found occurring with other diseases or in broken down constitutions. He (Dr. A.) was sure Dr. Johnson would excuse him when he said that pneumonia did not terminate in expectoration,* unless complicated with broughitis, and he very much doubted, whether the majority of these cases were not cases of bronchitis, instead of pure pacamonia.

Mr. Jounson could not regard picumonia as a mild disease. He had always found that the more actively it was treated, the fewer were the deaths. As to puenmonia in hospitals, the fact was that pneuof this proposition, and many cases had monia could not be explained by a few cases, and the patients that he had selected from case had been altogether overlooked. He the surgical wards were, many of them, in certainly thought that large bleedings, in rude health, who had been overtaken by

Mr. WADE said, with regard to the treatment of pneumonia, according to the mode Mr. Costello said that the Italian of exhibition recommended by Laennec, he in his practice. With regard to a remark (which had been incidentally made, that all adhesions of the pleara were not the result of inflammation, he would give an example in proof of the allegation, that had made at the time considerable impression on his mind. A portion of the lung recently taken from the body was brought to him, which by him, he would choose the mercurial. He he divided into two portions, and then did not think that the French surgeons were placed their out surfaces in opposition. On the following morning a perfect adhesion

It may be necessary to state—as the r of the proceedings to the proper compass does not make this isolated point obvious Johnson assigns expecturation monia, which Dr. Addison detom of that affection when

appearance as were produced by the known process of inflationation.

Mr. SMITH believed that pneumonia attacked two kinds of constitutions, the strong and the delicate, and he presumed that the mercurial was best adapted for the plethoric, and the antimonial for the weak. The President then adjourned the meet-

CLINICAL LECTURES IN LENBON .-- To the Editor. - Sir, -- It is stated in your Number for November 7, that 12 years ago there ; was not a chnical lecture given in London. As regards the Hospitals, to which the statement appears to refer, this may be correct; but as the fact is not stated with such limitation, I beg to observe that Clinical Surgicul Lectures were given regularly at the Finsbury Dispensary by myself in the October of 1821, subsequently to my election in the preceding April, and these were I believe. the first clinical bectures delivered in London. Leaving it to you to make any use of this note you may think proper, I remain, Sir, your obedient servant,

GEORGE MACILWAIN.

Mar ne

Argyll place, Nov. 17, 1835.

Cabout twenty years of age, had isred under disbetes mellitus for up of two years, and had taken successi mineral acid, tinct. ferri mur., et pot sulphas, but without effect. In the me of May last I commenced exhibiting in in the different forms of the ioduret of iron, and of potassa, and, lastly, in the form of tincture. Shortly after the commencement of this treatment a good deal of expectoration took place, and mucus was thrown up regularly every morning. By degrees the urgency of the case subsided, and now, although the weather has become cold, very little tendency to diabetes remains. I hope that others may try the effects of this drug in this generally uncontrollable complaint, and watch its action and result. I remain, Sir, your obedient servant.

Goswell-street-road, Nov. 17, 1835.

_ Our correspondent should have added his name.

DISTRIBUTION OF SUBJECTS. - To the Editor .- Sir,-1 shall feel obliged if some explanation is given in the next Number of your valuable periodical, of the cause of the present very unequal distribution of subjects for disaction; one of the west-end schools having as many, or more than they can dissect, whilst in the Borough we can get very few indeed, bearing no comparison to the demand, and proving a very serious inconvenience to the students in general.

I am, Sir, your constant reader, A WEBS-STREET PUPIL. Nov. 16, 1835.

". We much doubt if the " distribution" is unequal. Does our correspondent know the proportions on authentic information?

To the Editor .-- Sir, -- I throw myself on your justice, in transmitting the following reply to an article in a late Number of Tue LANCET, Aug. 29, on the subject of " Dr. Wright's Pearl Ointment for Cutaneons Diseases." of which I am (by purchase) the proprictor. The writer of the article, without qualifying doubt, asserts that the active principles of this cintment are arsenic and IGDINE IN DAMAGES MELLITUS .- To bichloride of mercury, -- yet it does not conthe Editor. Sir. The perusal in your extain an atom of either of those substances! cellent journal, of a paper on the discovery. It is not surely too much, therefore, to exsugar in the blood of a diabetic patient, pect that his pathological deductions are aced me to forward to you a no equally fallacions; and that the symptoms, k case which I have treated suc- which he describes as having succeeded to in the connection of cause and effect, with the application. The writer of course is too homographic a man to ascribe effects to this ointment which he does not conscien-

tiously believe to have resulted from its was, or which he knows were produced by other treatment; he is evidently a man "who bears his faculties so meekly," that he is wont rather to extenuate faults than " set down aught in malice." * * Sir, yours respectfully,

ZACCHEUS HUNTER. Webber Rew, Blackfriars, Oct. 24, 1835.

*. No attack having been made by our correspondent, "A Licentiate," on the character of the late Dr. Wright of Stafford, we have omitted the concluding portion of Mr. Hunter's letter, thinking that it was both uncalled for and unnecessary .- Ep. L.

NORTH-LONDON HOSPITAL.

LITHOTOMY. - Mr. LISTON performed this operation on the 28th of October, on a youth aged twelve, who had suffered under the disease for some time. The operation was performed in the usual manner, but the surgeon found it necessary to divide the right side of the prostate, in consequence of the inordinate size of the stone; he re-marked that he preferred taking such a step to lacerating the parts. The stone was such a clear and simple account of the stomach as he of about the size of a pullet's egg. The wishes to see, in the Paint Namber of slittle Monthly operator observed that it was not often that! Magazine published in London, called "The Chrisstep to lacerating the parts. The stone was operator observed that it was not often that stones of such a size were removed from subjects so young, but he had in some in-stances met with them much larger, even in it was always necessary to proportion the forceps to the size of the stone to be removed. The operation was completed been doing well.

NORTH-LONDON HOSPITAL.

CLINICAL LECTURE

ERYTHEMA AND ERYSIPELAS, in depth.

Delivered in November, 1836,

BY MR. LISTON.

THE last time I had the pleasure of socing it will follow a trifling wound, especi you here, gentlemen, I proposed saying any of the fibrous tissues, or of something with regard to stricture of the at the point of the elbow urethra and other diseases of the urinary tacks of erysipclas are al urethra and other diseases of the panied by more or organs, but two very interesting cases, more panied by more or organs, but two very interesting cases, more panied by more organs.

tunity of making some remarks upon the cases whilst they are fresh in your recollection; therefore, with your permission, I shall for the present delay my observations on urinary diseases, and take up the subject of erysipelas.

The cases to which I have alluded be opportunities of observing this disease in an hospital that was extremely unhealthy, until the management fell into new hands, when, having the opportunity of becoming in some measure the instrument of reform, I endeavoured to amend the unhealthy condition of the institution, and succeeded in my object. Now this is a disease which is well worthy of your attention and study, seeing that it is apt to follow all sorts of in-

dermath.

The one form of the disease, also, is apt to pass into the other. The erythema, so called from its red appearance, is apt to pass into the substance, and become what is called "erysipelas," a disease which involves the neighbouring tissues. We have then an intense redness of the surface, and a swelling of the parts attacked, which passes into the subjacent tissue. Thus the disease is apt to spread both superficially and

The constitution is predisposed to attacks of crythema or crysipelas. Disorder of the digestive organs predisposes to it. It is very apt to attack hard livers, and those who indulge in spirituous liquors. In such patient

autumn it mostly prevails; and at those peby the London road, must have observed a valescent. large piece of flat ground, covered with and before that regiment left the barracks, a considerable number of men, and two or three of the officers, were destroyed by

The disease may also be produced from exhalations from dung-heaps, or filth collocted about hospitals; and I recollect that a hospital at Edinburgh, in spite of all trances I could make, a quantity

The state of the atmosphere predisposes contagion. There is not the least doubted / very much to the disease. In warm damp that. One of the cases at present In the weather it is more frequent than in very hospital shows that fact tolerably well, cold or very hot weather. In spring and though a stickler might say that the woman was exposed to the same exhalations, or to riods you can almost predict with certainty the same atmosphere as her mistress, whom the prevalence of erysipelas from the state she attended with the disease before she the atmosphere. It also often arises came in here. I allude to the patient who my putrid exhalations, and the exposure is lying at the farther end of the ward of patients to miasmata. A very remark- No. 2. such. In the sort 1911 are very often white extrinsied to the surface, which I alled on to make decline in the control of some coefalled on to make measure individuals the inter. Without thought the late, matter will satter. Withou stage was matter will bring in very prest describing in Sarge bag. one time arm sloughting of the Brous saue occurs, and ultimately, the destrucon of the patient. I have again and gain seen sloughing of the aponeurosis of pecipital bone, where the patients have gled through, in spite of the treatment, ad in spite of the neglect, though a great of such patients have died. You rould therefore make the incisions, and at a early period, that is, as soon as the prence of matter is indicated. You are not wait for the redness of the integument, r for the thinning and pointing of the ab ess, but must make the incisions into lose parts which feel boggy. It is much ctter, indeed, that you should be disap-ointed occasionally in not finding matter, ian that matter should be left under the raip. In erysipelas of the extremities, here the formation of matter, or sloughing, threatened, you must use pretty free in-The suggestion of this practice is laimed by modern writers on surgery, ut the fact is that the old surgeons knew amething about it, as well as the surgeous f the present day. Here, for instance, is n old writer who says, that "scarifying he skin in gangrene is a very idle practice, pless the surgeon hath sagacity enough, then the membrane is not destroyed, but nly ready to suffer, to cut largely through oth, and thereby let out the inflamed juices nd by that means take off the distention." f that is not to the point, I am very much nistaken. The writer proceeds to say, " In uch an act, the surgeon shows both judgsent and resolution, and such good treatneut continued may cure the patient." here is just as much in this short quotaion, as you will find in some of the modern

548V8. Now it is not necessary to make an inciion from one end of the limb to the other. laving searched out the point where the nfiltration is greatest,-where you think here is a certainty that the cellular tissue s broken up, and where the matter, if any, nay be discharged, you should there make he incision; and one incision is just as good is half a dozen, or a very long or large one. The patient Brown from whom this sketch vas made, was admitted into the hospital ome time ago. He had received a blow on he point of the elbow. I do not know vhether there was any wound: but if any xisted, it was small; but I again warn you, hat those wounds over the point of the over my joint, are very apt to PRODUCT.

ing lotion or other, very likely contains Goulard's extract, and there was a gre degree of tension and throughland. Late t part which was principally infilted made an incision, and a quantity of blood was evacuated, and sero-purulent matter ill-digested pus. Immediately upon the incision being made, the redness went off. In two days he returned here with a discharge from the wound, in no great abundance, perfectly healthy, and with the whole of the inflammation gone. The man was cured, in fact, upon the spot.

Now as a local application, I would recommend to you, in preference to any other, frequent fomentation, and with fluid of a comfortable temperature. You may have your liquid for fomentation, medicated or not, as you choose. Patients, however, are inclined to use, and persevere with, medicated applications much more readily than others. You may have simply a couple of bags, containing chamomile flowers, in a basinful of hot water; one of those hags, after lying awhile, is to be squeezed dry and placed on the part, and the two are alternately to be applied, hot and hot, for half or three quarters of an hour at a time. These applications are very grateful to the feelings of the patient, and give much greater relief than any other. They act beneficially by keeping the surface perspirable, promoting the discharge from the surface, and increasing, also, to a certain extent, the secretion into the cellular tissue, - a means which nature employs to relieve the excited capillaries. When effusion can take place readily into the cellular tissue, the inflammation is of a milder kind, the patient suffers much less, and great advantage may be derived from increasing this effusion instead of pre-venting it. After the fomentations you may dust the diseased part over with some bland powder, - flour, or any thing of that kind,with a further view of relieving the feelings of the patient and of protecting the tender This prevents any and irritable surface. sudden change of temperature, or blast of cold air, from repelling the inflammation; but you are still to foment, after the incisions or punctures have been made, from time to time, say three or four or five times a-day, according to circumstances.

I should have mentioned, in speaking of the constitutional treatment, that it was essentially necessary to put the digestive organs into proper order. The bowels must be emptied, and any unessiness which exists about the stomach and liver must be resignit,-wounds of the fibrous tissue lieved by the application of leeches, and you will find a great advantage after the erysipelas. This bruise was bowels are emptied, from the exhibition of small doses of antinonal medicines, company and the small doses of antinonal medicines, company and the small distance bland if you like with a little school. bowels are emptied, from the exhibition of seance which is seen bined, if you like, with a little calomel.

The works of DESAULT, which were revised and edited by Because, continue and cellent memoir on this subject, where practice of exhibiting small doses of an-timony is recommended strongly, and this ractice you will have no reason to regret. he antimony keeps down the force of the circulation, it acts beneficially on the bowels, and it promotes the secretions generally, while undue inflammatory action exists. blackened with the caustic. "gangropous," nor "necrotic" (to coin w adjective), if the surgeon knows what about, and gets the patient under re early enough in the disease. There should be no destruction of the cellular tissue, far less of the skin or of the bone in those Cases.

I do not think, gentlemen, I have anything else to say on this subject on the present occasion.

ST. THOMAS'S HOSPITAL.

CASES AND CLINICAL REMARKS.

NEW TREATMENT OF WOUNDED ARTERIES.

CARE 1. - Wound of the Brackiel Artery in Venesection .- Eleanor Hughes, retat. 25, married, admitted under the care of Mr. Tynnell, March 3, 1834, occasionally suffering from headaches, and in being bled this morning the brachial artery was wounded. Compression was made above the puncture, but she lost eight or ten ounces of blood, and became extremely hysterical. Soon after, a "ring tourniquet" the insertion of the corneo-brachialis. The ing slightly; general health tolerable. ring tourniquet consists of a metal ring, larger round than the limb, and about an tapped so as to admit a screw, to the lower | puncture. end of which a pad is fixed, the outer end having a small handle to turn the screw, so adhesive deposit now quite absorbed; the that the pad can be carried to or from the artery can be felt pulsating in its natural centre of the circle. This instrument makes situation, but not at all increased in size, pressure only on two parts - by the pad on strength, or volume. On the 16th she was the astery, and by the portion of ring on the limb immediately opposed to the position of the artery; thus it does not interfere with the lateral circulation. A firm compress, wetted with cold water, was applied over the wound; the limb was handaged tightly, from the fingers to the tourniquet, and the arm was elevated so as to favour the return of the blood to the heart. The whole limb was enveloped in flannel.

9 p.m. A dose of ammonia with campbor mixture relieved the hysterical symptoms. Tolerably easy, but rather restless; pulse soft and compressible, tongue slightly furred. Opi Sed. In xxx.

a telerable night, complains of

in the arm, which is of the the temperature as the rest of the budy. 6. Bowels have been opened once only,

and that by medicine, since her admission. Complains of pain in the arm, and is very

restiens; pa e 90, and soft. 7. The ring tourniquet slipping very much, a common tourniquet was put on instead. Whilst removing the compress and bandage from the puncture, about a tempoonful of healthy pus escaped, which afforded her great relief. Simple dressing and a soft compress of lint were applied, and the whole was secured by a slight bandage. A common arm-splint was placed on the under surface of the limb to keep the arm extended. Pulse 94. Ordered Colorynta and Calomel, and an enema every evening if

8. Has been rather sick; the arm has been very easy; very little discharge from the wound, and no hemorrhage, although the tourniquet has been stackened considerably. Bowels relieved three times; pulse 90, and soft.

necessary.

9. No sickness, but says her arm feels hot and burning. On removing the dressing, a little pus escaped, but the wound is granulating.

10. Her arm is very easy. As, however, she complained of great pain from the tourniquet, it was taken off. No hemorrhage has occurred since.

15. The wound nearly healed; there is much adhesive deposit still left around the was put on, so as to compress the artery near artery, through which it may be felt pulsat-

17. Going on extremely well; arm supported on a splint in a semiflexed position : inch broad at the circumference, which is a firm compress is still applied over the

> April 10. Puncture perfectly healed: the presented cured.

> Remarks .- "I have seen the patient frequently since" (said Mr. TYRRELL, in commenting on the case), "and she can use her arm without difficulty, even in heavy work. There is no appearance of disease of the artery or veins. This is the fifth case of puncture of the brachial artery in bleeding, which I have thus treated, in every instance, successfully. In one case I had an opportunity of examining the parts several weeks after the cure had been completed. The patient was at St. Thomas's Hospital, and in performing venesection, one of my dressers punctured the brackial artery; I was sent for, and adopted the treatment prescri the foregoing case, with success. Some weeks after, the patient died suddenly, when I found that the median wein had its cases obliterated for half an inch above and be

united, and its caliber perfect. The parts are

preserved in the museum."

CASE 2 .- Wound of the Radial Artery .-W. Lowe, metat. 22, carpenter, admitted under Mr. Tyrrell, Nov. 11, 1834. In cutting bread with a penkuife, the knife slipped, ran into his wrist, and was immediately followed by a large gush of blood, which he commanded by pressure till he arrived at the hospital. On examination, a small wound in the integuments was observed, which penetrated to the radial artery as it passed over the insertion of the muse, sunin. long. Large gushes of blood pumped out rapidly, but were restrained by pressure of the vessel above. A common phial-cork having been split vertically, one portion of it, wrapped round with lint, was placed with its convex surface upon the artery above the wound, and tightly confined with sticking-plaster, which immediately arrested the hemorrhage. The edges of the puncture were then brought together with plaster, a compress was applied over it, and the whole was confined with a roller. The hand was tightly handaged, from the fingers to the wrist, and the limb kept elevated.

Nov. 12, 13, 14. Going on well.

17. On opening the bandages to-day, union had not taken place, but the bottom of the wound was healthy and granulating. There was not the least bleeding either from the wound, or on removing the compress on the radial artery. He had some pain and cedema of the hand, owing to the bandage round the wrist, which was therefore loosened, the arm and hand well kept up by pillows, and a large poultice was applied to the hand. In the afternoon bleeding again occurred; the compress having been taken off, it was reapplied; the limb was confined as before, and the hemorrhage stouned.

24. No disposition to bleed since; the wound only requires cicatrization for its

perfect cure.

28. The compress is still retained, but not so tightly as to prevent the flow of a certain quantity of blood.

Dec. 5. No return of bleeding, the external wound is almost healed, and on the next

day he was presented cured.

Remarks .- " The vessel," Mr. TYRRELL remarked, "was wounded in a position in which it could have been secured without difficulty, but the case illustrates the success of the plan. The treatment I consider especially applicable to wounds of arteries difficult to get at by operation, without risk to other important structures, as in the case of puncture of the brackial artery, in venesection, or in wounds of the palmar or plantar arteries. I have treated all the above named vessels, on the plan described, successfully. The principle of the treatment consists in arresting or diminishing favour!

low the puncture; it was adherent to the the low actions to the injured vessel, artery; the wound of which was firmly pressure of the trunk or tranks codimu pressure of the trunk or tranks commu cating with it, in keeping the wounded p carefully adapted by moderate pressured in preventing renous congestion, by position and support of bandage, and in forming the adhesive union by perfect quiet. It is necessary to persevere for two or three neeks to cusure a perfect cure."

> BROKEN CATHETER IN THE BLADDER EX-TRACTED THROUGH THE URETHRA.

> Joseph Strangmore, wtat. 40, admitted under Mr. TVRRELL, Jan. 11, 1835. Has had stricture for some years, and passes in-struments for himself. This morning, however, on passing the instrument, it met with great resistance in the bulbons part of the urethra, and on using force the catheter a No. 6) gave way an inch above its curve, where it had been once soldered. He immediately set out from Reigate, twenty-one miles from London, and walked a considerable part of the journey. A sound introduced by Mr. TYRBELL evidenced the piece of catheter lodged at the fundus of the bladder transversely, its extremities being held with some firmness by that viscus. He dislodged it by passing the end of the sound beyond it, and drew it forwards to behind the prostate gland, where its position was still transverse. The bladder seemed to contain several ounces of urine. sound was withdrawn, and one of Weiss's instruments for extracting small calculi, which was nearly straight and had a strong spring, was introduced. One extremity of the foreign body was now free, and after several misuccessful attemuts. was seized and cautiously brought into the urethra. With the finger in the rectum to compress the arethra between the foreign body and the bladder, so as to prevent any retrograde movement of the former, the piece of catheter was then drawn out. It measured three inches in length. The examination and operation together occupied about twenty minutes.

Jan. 14. Feels quite well, and has passed his water much more freely than for some years past.

The museum of the hospital affords several portions of catheters &c. removed from the bladder, but all by the lateral operation, Mr. TYRRELL says he believes "that this is the first instance in which an attempt has been made to extract by the urethra, and he trusts the publication of it will prevent the more severe and hazardons operation. cases of a similar nature, for the How forcibly these latter observe be made to apply to cases of bladder, and extraction by that operation

BTIMULANTS.

puel Wiseman, ætat. 49, admitted under Mn Trarell, Sept. 22, 1835. While ra-the intoxicated he had slipped down and broken both bones of the left leg, at about their niddle, where they had been already fractured five times. Much contusion attended the accident, and there was considerable spasm of the surrounding muscles. The limb was placed on a pillow, spirit-wash was applied, and next day the leg was put in splints and placed in a swing-box. R. Mist. Senn. Comp. p. r. n.

Oct. 2. He complained of headache, which continued the next day. On the 4th, his bowels were freely relieved by medicine given the night previous; but he still complained of headache, and seemed rather heavy, and the head was hot. B. Pulv. Jalap. c. Hydr. 5j, bac nocte. Lot. frigid. capiti.

5. He complains of pain in the head, and has partial paralysis of motion in the left arm; the sensation is perfect; entire paralysis of motion of the left side of the of blood which is essential to its functions, face, but the tongue is drawn towards the affected side; pulse 72, and bearing pressore. C. C. ad Exvj occipiti. Ahrass, capiil. applie. Lot. frigid. Rept. Pule. Jal. c. Hydr. Mat.

8. Has been frequently delirious; the paralysis continues; pulse irregular, and very compressible; bowels open. He was ordered a pint of porter, and four ounces of gin daily, which latter he began to take next morning.

symptoms of paralysis subsiding.

was removed from splints, and the fracture open, the bone exposed, and the patient found firmly united.

cylindrical bone of any size had escaped, went on without a check, and did well. in consequence of these fractures he has One, perhaps, of the most trifling injuries

ACTURE OF THE TIBLE AND FIBULA, one for which he came under my care. He wire paralysis on the team worn an iron to make up the difference in the length of the two limbs, and it entitled the same of the two limbs. abled him to move himself about, but with some inconvenience. Finding this, I stated that it was possible to set the recentlybroken limb to the same length as the one formerly broken, and at his wish I did so. I made an angular union of the second limb, and reduced it to the same length as the other, and he was enabled afterwards to make progression more easily and rapidly. Wiseman appears to have that condition of bone which renders it extremely brittle. In such cases (unless at an old period of life) there is almost an equal facility of union. In the man who had had twenty-one fractures, the accidents were repaired with great rapidity, the union of fracture of the femur being perfectly firm at the expiration of three or four weeks.

In examining particularly into Wiseman's case, it may appear remarkable that the man should suffer from headache, and suddealy have the paralysis displayed, without any active mischief in the head. But there has been a portion of the upper part of the epinal chord deprived of the due quantity and it thus influenced merely those portions

of the body which I have stated.

I have had several somewhat analogous cases under my care. The first instance in which I had a distinct perception of such a case in a surgical patient, was in a coalporter, who became intoxicated, tumbled from a waggon, and had both wheels pass over his arm, when so much were the parts disorganized, that it would have been difficult to recognise them as belonging to the human body. Amputation was resorted to. 10. Slept well; no delirium; pulse firmer; For two or three days the man went on extremely well, but on the third or fourth 13. The paralytic symptoms have entirely day the man was suffering from erysipelas. subsided, and on the 4th of Nov. the limb I found the parts, previously united, again delicious. I then learned that he had been addicted to taking a large quantity of sti-Remarks .- " This case," said Mr. Tva- muli. The apother pure atmosphere, I believe very many creaty had employed leecher and blisters to loss would be lost than there are at pres anbdue inflammatory action, but seeing that under circumstances such as 1 have man the patient's countenance was pailed, his hand cold, and the pulse irregular, I decided on giving stimulants, in spite of local pain, redness, and swelling. I ordered him a dinner of good broth, meat, and beer, and or five patients suffering from erysipelas at of the tumour. once. One of the patients has been taking five grains of quinine every three or four hours, and a pint of porter and a bottle of wine a day, and he has recovered; and the other, a bed or two off, has done well under loss of blood and powerful purgatives.

Applying these views also to medical cases. I formerly had many opportunities of conducting post-morten examinations in the hospital and out of it, and of examining cases where the patients had died of fever. and (in children), of measles, scarlatina, and so forth. In many of these cases we found that the patients had suffered from a serous effusion. Very often rallying from the primary disease, children are seized with local is, in most of these instances, that the viscus has really suffered from a deprivation of blood, and death is consequent on serous effusions. Thus you will find the cellular tissue of the lungs gorged with sertan; the cavity of the pleura half full of fluid; and, where the symptoms affect the brain, you find its effusion in the ventricles at its base. Thinking over these cases, and conceiving them to be somewhat analogous, I was led to make the above observations. Where there in strength there is no objection to moderate counter-irritation; but where there is irregularity of circulation, the abstraction of blood is always mischievous. The great reason why such depletion is resorted to of pus. over and over again is, the slight temporary relief which it affords. In the case before us the man was cupped and leeched, and he appeared to be better for a short time, but was absorbed, and the accepted he afterwards became more restless and distinatural size shorter. turbed, and then he was relieved altogether June 16, whe

TREATMENT OF BRONCHITIS.

MR. ROBARTS, the secretary, re

fants he considered it not unfrequently implicated with pneumonia, and sometimes minating in croup; or, on the other hand, up terminating in bronchitis; the last of ich, he thinks, is the most common. The ctions of respiration were more promine in bronchitis than in pneumonia. As to the severity of the disease, he was convinced that practitioners would generally do well to leave nature to accomplish the cure her own way, for the more they attempted to do, the greater number of patients they lost. In the young, if left to nature, not more than one in fifty cases would be lost. When he first entered the profession, he adopted the depleting treatment of the day, and the result was, that he lost nearly every patient. Fortunately for his patients, one child fell under his observation which got mode of treatment would be less disputed, well without any treatment; and a second case recovered through the administration of wine. With these examples before him, Robarts, that if the antiphlogistic treatment he was induced to adopt more simple reme- was pushed far in children, failure would dies; and since then, his mode of treating generally result, the lungs in children not bronchitis in young children had been albaying the power to withstand powerful together as successful as it was before remedies. Calomel also had failed to be mesuccessful. His remedies were of the with him so decided a specific as many mild kind, but the greatest benefit he practitioners professed to find it. When had derived was from the vin. sem. colch., the condition of the lungs arose from a concombined with, or followed by, purratives, gested state of the circulation, accompanied. The effect of colchicum in hum hat after with a quickness of pulse (query slowness?) ing children was very remarkable. If given and a difficulty of breathing, stimuli would followed in a few days, and the cough, fre-quently so troublesome, was arrested by it that advised by Mr. Robarts, and would also mooner than by any other remedy. In old give opium and calomel, and he would followed by purgatives; and as in them it the chest.

was a severe discase, he would recommend a combination of the two. The advantage jopinions on the treatment, not a whit less of purgatives was made known to him contradictory as regarded the principles and to blisters, and was surprised that practi- disposed to give to it. tioners had so great a predilection for them in this disease; and opium he looked upon, injurious. He had also found expectorants journed. prejudicial, for the expectoration was profuse in the first few days of the attack, but as the inflammation progressed, the secretion ceased, and it was vain to attempt to reproduce it by expectorants.

1

Dr. Chowne begged to remark, with! reference to the interesting paper which p read, that Mr. Robarts must have Culien, when he implied that

cthoscope, the disease would have remain- | done, Cullen himself saying, that writers l undistinguished even up to this time. In called the disease by different names. Lacunec preferred the term of catarrh to that of bronchitis; and to prevent it from being missoplied to designate a simple cold, he divided it into active and passive. Dr. Dun-can also had described the disease, and admitted that consumption might supervene thereon.

Mr. Jones believed that the first author who had used the term "bronchitis" was Franks.

A VISITOR differed in toto from Mr. Robarts, for, in his practice, he had found the utmost service from calomel, ipecacuanha, and tartarized antimony, and leeches, in bronchitis; few cases he thought admitted of the warm-bath, except at the commence-

ment of an attack.

Mr. HEADLAND believed that the proper if we understood what was meant by the term "inflammation." He agreed with Mr. when the child was apparently dying, relief be found beneficial. In old people, he would people he employed bleeding pretty freely, strongly recommend mustard poultices to

drachm of the tincture to a pint of water) after various other remedies had been uselessly tried for some months. No constitu-tional treatment was required. Dr. Stewart asks, Is it an effectual remedy, or accidental? Very little notice was taken of the remedy by the members, who admitted that the opium had not over-acted its part, for some cases got well without any treatment, others certainly from merely being sent into the country: and others, again, from being treated by leeches, and with evaporating lotions.

Mr. CLIPTON strongly recommended a wash composed of 5ss of the strong sulphuric acid, with 3i of water, which he (Mr. C.) believed, after an experience of twentythree years, possessed advantages over all other remedies. The nitrate of silver would insulate the disease, and destroy its contagiousness. He regarded every species of the disease (except porrigo favosa) as purely local.

The magnetic plates are used where the horse-shoe magnet cannot be applied; as when magnets, are required to be fitted to any part of the body. For the treatment of diseases with either kind, either powerful instruments were used from time to time, or the contimual influence of magnetism was employed, by the patient wearing small magnets for some time on the part affected. The former in a certain order, with one or two poles, and with one or two instruments, always followhead downwards. For the toothache, he for the cure of diseases, could now be rea-(Dr. S.) usually fixes the north pole first on dily obviated. the painful tooth, and it not relieved, then applies the south. If obstinate, he touches the gams with either of the poles, or passes them across the cheek, where the pain is gute. The magnet should be first The general magnetic treatment the topical, especially if

magnetism, Dr. Schmidt said, was always declared to have no influence on healthy parts. Secondly, On the sick, magnetism is either soothing or exciting. Dr. Becker says, "Very often the patient considers that he has no sensation at all from it, but generally in the course of time, he experiences an effect from it." The sensations are, with some slight modifications, the same in all cases, viz., cold, warruth, increased sensibility, and pulsation, and numbness and insensibility in the part affected. These sensations, except the last, increase gradually, and then become weaker, until at last they disappear entirely. Dr. Schmidt concluded his paper, by saying that the effects of magnetism appear very often instantaneously. is either topical or general, and employed That they are not local, and that the diseases in which magnetism exerts a curative power, are those in which the sensibility or mobiing the course of the nerves in passing them. lity of the nerves is heightened, or where According to the theory hitherto followed, the nerves are over-excited, as in tieit is supposed that the "friendly" poles as douloureux, headache, &c.; in spasms of the they are called, ought to be placed opposite stomach, pulpitation of the heart, hoop-to each other, in order to lead a magnetic ing-cough, chilepsy, and convulsions; or stream through any part of the body. The where in the nervous system there is a want revorse he (Dr. S.) would prove to be the of action. Also, in some diseases not fact. (This was demonstrated with a sheet purely nervous; as in rheumatism, gont, of cartridge-paper placed between the mag- suppressed menstruation. Dr. Addison, President.

MINERAL MAGNETISM.

The subject of mineral magnetism was tast division of his sub- again introduced this evening, with much the effects of mag- amusement, though not with much profit, the unhealthy. and the discussion was champly my, that marion from some of the and the discussion was closed with an intiturn which it had taken was not consonant simple results of magnetism by induction with the objects of a medical society. Dr. Mr. Bird, however, was himself sharply hit c SCHEIDT, of whose talents it was impossible the knuckles by Mr. Everitt, who sudden to avoid forming a favourable estimate, and interfered, " in order to save the time of the who addressed his audience in the English Society, to remind the young gentleman the language with a corrections which many those who were better acquainted with speakers of our own nation might be glad, subject did not admit the truth of the p to reach,-recommenced the subject by re- tions on which Mr. Bird was basing the peating some experiments, concluding, how- whole of his objections." Mr. Bird, in act, ever, rather abruptly, and leading the dis- was proceeding to prove that the relative north poles of two magnets ta space intersouth poles, and that therefore in employing horse-shoe magnets on a limb, it was erroneous to oppose, on each side of the limb, a north pole to a south, and a south pole to a north, as the remedial process had always hitherto been performed, and always, consequently, with less success than by his (Dr. S.'s) mode. Testing this statement by experiment, the result seemed to bear witness to the correctness of the allegation.

The experiments called on his legs Mr. Bian, who gave some designation to them which Dr. Schmidt did not consider very courteous. Considerable disputation resulted, for Mr. Bird denied the correctness of almost every proposition of Dr. Schmidt, and then, between various parties, began a series of not very obvious, or very conclusive, or very-well-explained experiments with magnets and iron filings, accompanied by diagrams on a black board, all, too, so purely theoretical, that a moral, only,which there is no need to explain -could be drawn from them. Yet the exhibition was tolerably entertaining, and might, had the philosophers been better agreed as to first principles, been useful to a majority of the audience, of whom Dr. Johnson afforded a good specimen, when, with rather unhappy look, he remonstrated, at the close of two hours, on the time of medical men being occupied so long on the mysteries of "north poles" and "south poles," magnotism by direct procedure, and magnetism by induction. "Let us know," he prayed, what diseases magnetism will cure. We care not what influence it exerts over mariners' compasses, or bunches of keys, or steel

Mr. Bird declared, as we have said, that Dr. Schmidt's proceedings were all " flimsy, and pronounced the chief results to be the

cussion into a direction which lost for mag- quantity of the magnetic fluid at the posinetism its chief claim on the attention of tive end of a bar of soft iron, would be shown the Society. One experiment was designed by the power of attraction exerted by it to prove the discovery of Dr. Schmidt, that over particles of iron filings represented more magnetic power exists between the thus, $\times 3-2=1$; or, that in the horse-shoe magnet, at its north or positive extremity, vening between them) than between the the magnetic influence would be represented by 3; at its angle or intermediate space by 1; and at the south, or negative extremity, by 0. This problematic experiment Mr. Everitt sought to show was in direct opposition to the "indisputable fact," that if a bar of iron were divided into any number of parts, no piece or division of it would contain more magnetic fluid than any other. provided the size of each division or compartment was exactly of the same size as each of the others, and if the division be carried down ever so low, the fact would, he contended, still be obvious.

Mr. Bian met this charge by declaring, as he did on each other occasion on which an experiment or argument was used against him, that he regarded it as a beautiful example of the theory he himself wished to advance; but having stated the theory and the objection, we must be content, from want of space, without giving further details on this point. Mr. Bird apologized for presenting himself to notice, and stated his object simply to be to defend the reputation of several great men whose views were opposed by the theory of Dr. Schmidt.

A degree of interest was here given to the disputation, by the reply of Dr. Ritchie to a call from several members for his opinion on the points advanced, but we are compelled simply to say that that gentleman with much clearness developed the bestaccredited views on some points in magnetism, commenting briefly on the theories expressed by previous speakers, which, however ingenious, he did not consider correct in many respects. Circumstances, however, which we cannot stay to explain, prevented the impeachment of Dr. Schmidt's views from being sustained. Indeed, the time and apparatus did not admit of experiments in any respect conclusive upon any important point under debate. At the next meeting the medical division alone of magneti is to be emvassed, when the most probably be concluded. here observe that Dr. His was not of opinion could be advanta

diseases, though

[.] Dr. Schmidt also showed a method of obtaining • Dr. Schmidt also showed a method of obtaining the magnetic spark by means of a very simple appa-kates, constructed as follows. —A price of soft irro, sound which a copper wire is twisted, the extremi-ties being amaleamated with quickaliver, is placed over the poles of a magnet. On one is fixed a small copper plate, and the connection being then forcibly. broken, the magnetic spark is vividly produced.

MEDICO-BOTANICAL SOCIETY.

Tuesday, Nov. 21, 1835.

EARL STANHOVE, President, in the Choir.

Some beautiful specimens of the acacia. catechu, manchean gambeer; specimens of the greater and lesser cardamonis, and of the grains of paradise, this evening were exhibited as presents from Professor Martius, with a view of obtaining, through the medium of the Society, correct information as to their proper classification and derivation. Mr. Hiff and Mr. Battley also presented specimens, with a view to ascertain whence they were procured.

Dr. Sigmonn drew attention to a new sort of catechu, lately introduced into this country, which he said was superior to any hitherto imported, from its presenting a much larger quantity of tannin than the other species of catechu. The new species had been introduced by the cotton manufacturers of Manchester, who have found it yield a valuable dye. Dr. Sigmond then made some remarks on the different varieties of cardamoins. The medicine is brought from Singapoor, but as that is a free port, it is difficult to ascertain its original locality. The other variety (samples of which, parncularly fine, were on the table, is brought rom Java and Ceylon. Professor Martius seems to think that the grains of paradise tre in fraternity with the larger cardamons; out Dr. Sigmond said, that whoever tastes the paradise grains, will, from its peculiar flavour, readily perceive the difference.

Mr. Lury said it was impossible to arrive at a proper solution of Professor Martius's questions, until the different importers had seen consulted.

Dr. RYAN also made some observations on the catechu and cardamoms.

A paper was then next read on the different backs of Guiana, forwarded to Dr. HANCOCK, who transmitted the paper to the society. A splendid branch from the castoril tree (ricinus communis), reared in the Society's gardens, the property of Mr. Gibbs, was presented, covered with seeds, and albough grown in this country, it was as perone of those sent from the East or

of different drugs) said ought to supersede the sulphate of quinine, for it contained "nature's own acid," and the gallic acid, combined with the alkaloid, without having to pass through the numerous manipulations of the chemist, which rather obtained educts than products. The Society was then adjourned.

.In Inquiry, Physiological and Pathological. into the Procimate Cause of Cholera. By PROTHEROE SMITH, M.R.C.S., Sen. Surg. to the Farringdon Dispensary. London: Baillicre, 1835, pp. 39.

To know the first tissue in which a disease commences, is not to know the "proximate cause of that disease;" nor does a knowledge of the first step which a disease takes, imply a knowledge of its "origin." To inquire into "the proximate cause of cholers," is, in reality, to carry research up to the identical cause of the first derangement of the earliest tissue affected. Over the cause of cholera we agree with the author that " a cloud of mystery hangs;" but from around the chief features of the disease itself the mist we think is now dispelled, and amongst those who have helped to clear away the vapours, we must rank Mr. Smith. The modes of treatment which are urged to cure the discase are as various as they seem to be, first, because so many medicines produce the same ultimate effects on the animal economy; and, secondly, because the profession do not choose to agree on the therapeutic details which their therapeutic doctrines might teach them. That the view we take of the "cause" of the disease is held by Mr. Smith himself, the following sentence demonstrates :-

" Mental disquietude, or atmospheric influence, often exists as an exciting cause of diseased action, producing effects on the sensorium similar to those caused by external bodily injuries, and often inducing more suddenly the results above enumerated, as . The capsules were exceed- is instanced by imbecility or death occasionservered with rough spines, cd by fright or grief, and by epidemic disorders arising from miasurata and other like math, pure and im sources. Thus, even when the exciting cause disease not cognisable to the senses, it often produces sequels more vismit than the results of extensive corporcal Injury."-p. 10.

He nuts saids the cause of the discuse in order to discuse the conditions of body wader which its phonomena occur.

" I proceed to the inquiry of those conditions under which occur the various plicnomens constituting the disease under consideration. Of the ultimate cause, or first principle, from which cholera results, I shall not attempt to offer any other solution than is their least valuable commodity, and shall in the hears to propel is through the usual proceed to treat of the proximate or hume in the hears to propel is through the usual channels, supposing they were of sufficient diate cause from which the evidences or eather to admit this these need duid. The proceed. -p. 11.

prefixed to the word "cause," in medical the renal functions, and consequent contracdiscussions, in a manner which questions in the exact sciences will not allow. wisions .. When the project was Cost antounced for founding the University which is now proceeding in its successful career in the northern part of London, the projectors were made the objects of contemptations ribaldry, by the members of that wealthy and influential party which had so long directed the destinies of the empire. Entirely destitute fof arguments which could be urged against the philanthropic scheme, the opponents of the measure resorted to every species of slander which malignancy could invent, in order to deter the subscribers from proceeding in the great national work in which they had cogneged. It was pretended, indeed, that the idea of founding an University in London, or, rather, of establishing colleges in London, which should confer on the metropolis itself the title of "an Univer-ity," had originated in a desire to offer an opposition to the national Universities of Oxford and Cambridge. The pretence was the offspring of falschood, bigotry, and folly. The founders of the University were stimulated by no such unworthy motive. On the contrary, there were to be recognised amongst them men of the most distinguished and exalted attainments,-who were indebted for their learning, and the multitudinous picasures which they had derived from the cultivation of their minds, to those splet-lid institutions which it was alleged to be their object to destroy. In the secure possession of a vast amount of real property. sustained and invigorated by a system of electing the roling authorities, so liberal in circumstances that can be related in con-line character that it is restricted only by the nection with the history of the literature of mamber of the Fellows belonging to the this country. It does not even appear that, Universities, what could such establishuntil a very recent period, the question of ments fear from competition? Nothing, But whatever benefit the members of those institutions can hope to create from the more wide diffusion of learning and knowledge, must arise from the stimulus of honourable rivalry amongst congregated masses of the literati of the empire, and, in reality, from the exercise of that just and useful invention alone.

We must too, keep a medicine chest, and they some-keep constantly talking, like my extermed times have the impudence to ask me to reform,' and ward off the evil hour as long instantur! The apothecary also complains as we can; and I do aware you, my dear sailly of the 'physician accoucheurs,' as triend, that I teel it a great consolation, to they designate themselves, certainly a cuhear that there is not one Fellow who in rious species of physicians,—a kind of nonhis heart desires anything like a radical descript animal, which we ought never to man, evisionals at bottom, and only make hermaphrodites do everything; they put use of the fifthy slang of liberation, that they the ladies to bed, - inoculate the children, may pull me down, and mount up their own scarify their gums, draw their teeth, give dear selves on the ladder of power. You them elysters,—cure the husband of gonor-will, I am sure, do me the justice to admit rhees,—bleed,—and, in short, do things that even the lowest of the " subordinates" will der that it should be so, if you will but for not do. The chemist is no less hurtful to a moment consider what could have ever the legitimate and pure physician. These induced them to be at the expense of the vagabonds take care not only to sell drugs, but to prescribe, which is most infamous, and must be put a stop to. The whole profession, indeed, seems to me to be in a state of revolution, so that I do not know well ordinate love of grade, or whatever you what is to be done, though, at the same time, choose to call it, could have induced them placed as I am at the head of the profession, I am compelled, by every moral feeling, to support that system of medical government which has worked so well for me.

" The weather here has been delightful. and I employ myself basily in making improvements on my beautiful domain, and in the society of my neighbours. There is a set of sporting men about here, for whose conversations I have generally no relish; but there are also some enlightened members of the catablished church, and a few well-educated squires, whose society I like. I amuse them by repeating the more imposing passages of my orations. There is very little female society within my reach; these I amuse in other ways. Old Lady an douber has, I am these I amuse in other ways. Old Lady

not understand the classics, I entertain her levery information about what is going on if with all my antiquities, and an occasional the profession, and believe me, bit of court scandal!

"I ride about a good deal, on an old pony, who is both blind and brokenwinded, and neither shys nor gallops off with me, but fatigues me sufficiently to give me a good appetite. My groom is very amusing in the account he gives me of the wonderful effects of all his nostrums, but not a 'subscription' (which is his name for a prescription) will he reveal to me. One day I said to him, 'What is that stuff, John, you are rubbing the mare's leg with? To which his only raply was, 'It is some things that I mixes together.' There is no doubt that the mystery which these grooms make about their stuffs, as they call them, and their humoral pathology, suits the minds of most people much better than one of my profound classical disquisitions. Well do I recollect my beloved friend and ever-to-belamented sovereign, George the Fourth, mimicking the manner and strange sayings of a royal groom who used to afford his majesty the greatest amusement. GEORGE was fond of a joke, and was so perfect a mimic, that had he been compelled, I have no doubt that his appearance on the stage would have been as brilliant as, on the throne, he was magnificent. Nobody with whom his majesty was ever acquainted, escaped his powers of imitation, and I perfectly recollect my quondam friend WARD-ROP telling me-which he did in the most delicate manner-how the King could, with the utmost accuracy, imitate my voice, my mode of expressing myself, and, above all, how fortunate he was in mimicking what I had always understood to be my forte, -my manner of coming into a sick room, and expressing, by my countenance and gestures, the utmost anxiety for the patient, and the deep interest I seemed to take in the minutest details of the case.

"I continue to take much pleasure in attending to my farm-yard, and although the markets are very low, I do not think the farm will be a losing concern to me this season. My fine beef has brought me from 3s. 6d. to 4s. per stone (sinking the offal). Mutton brings from 3s. to 3s. 6d. I am celebrated for my pork. Nothing, in fact, agrees better with my own stomach, and I have been feeding my domestics so much upon that food lately, that when I ordered my old-fashioned confidential bailiff, the other day, to slay a famous pig of the Chinese breed, he jocosely observed 'Law! yer honour, we have hin eating such a lot o'pork lately, that I'm now afeard to look a pig in the face.

"All these little things amuse me; they excite and occupy my mind, and keep away the blue devils of London. Write to me scon, and let the letter be long, and put in it pendent, but care

"Yours, very faithfully, "H. H.

"Leicestershire, Oct , 1835."

"P.S. Let me have a copy of WARDRO; 8 book on Blood-letting, whenever it appea s. I do not expect him to send one, not hav, ig given him a copy of my Orations, whis. I learn, by a side-wind, he was annoyes at. Let me also have a copy interleaved, for notes and observations of my own, as there is no subject in which I have ever been more interested than that of bleeding my patients.

CHRIST'S HOSPITAL.

To the Editor of THE LANCET.

LETTER FROM THE CHAIRMAN OF THE LATE COMMITTEE OF INQUIRY.

Sir,-You have taken a highly commendable interest in the affairs of Christ's Hospital, and have, as usual, been successful in aiding the correction of some of the gross abuses which prevail there. I thank you sincerely, in behalf of the children and their natural relations and parents for your exertions; and I call on you again to exercise your powerful pen, in reminding their parents' deputed and solemnly-charged guardians, to look first to their charge, and secondly to the manner in which they have acted under it. I have visited the charitable institutions of France, Spain, Germany, Switzerland, and Italy, and the information I there obtained has been improved by subsequent inquiries into our charities at home. firmly impressing me with the conviction that an impartial examination into the management of Christ's Hospital must be productive of prospective and immediate good. of the most extensive kind, to the objects of the founder, at once at Hertford and in London.

The medical question, which has so many times occupied your attention, has, at length, been disposed of, in a manner which does not, at the present moment, admit of being re-discussed; and I am sorry to say, that other matters, as regards the health and education of the children, seem to be relapsing into their former state. The unnatural practice of shearing the boys' heads has been revived, and the ringworm still lives and flourishes.

The Committee of Almoners appear to think that they are for ever to exercise their injurious influence over the health and fasture characters of the children. pectation, however, is, I fully .! vain one. They will ac longer find it available

y of "Pray support your committee"! Greibes governors, I am sorry to say, do pport that committee still, and will conti ue to do so. The ledgers of the hospital not be looked at with so much anxiety by them as their own. Still if they would but on'c, only once, take the trouble to inquire, the would, perchance, find that besides the inc. ae derived from the interest and possession of Treasurer's balances, and the expenses of residence (the Treasurer's especial perquisites), the salaries of clerks and servants amount in one year to more than one fourth of the gross income of the hospital! Would any of the numerous mercantile governors think that such a sum as 10,000% could be properly, or with safety to themselves, given, in the mere shape of salaries, to clerks and domestic servants, in their own establishment, out of an income of 40,000% a year? The fact I have stated should at least lead them, by analogy, to suspect that their unbounded confidence in the Committee may have been misplaced. Why, sir, the Committee of Almoners of Christ's Hospital have never, singly, turn by turn, or as diligent superintendents, gone through the wards and efficiently investigated the conduct of the nurses and other servants. And these gentlemen, too, are auditors of their own accounts. Meetings of Committees of Almoners are held, and that is all, and eight hundred children are committed to the care of servants!

With this brief summary of facts I beg to direct your attention to the circumstance, that a member of the Court of Governors has given notice that on Friday next he will bring under notice my petition, as that of a Governor of the Institution, to the House of Commons, on the subject of the abuses in Christ's Huspital. What that Governor expeets to accomplish on the occasion, I know not. He may desire to intimidate, but he will not succeed in his object; or he may find vent for feeling of anger at the exposures made in that petition; but be his object what it may, it is my intention to meet the case he may present, only with the petition to the House of Commons, replying no further than by the contents of that document. petition, you may remember, was presented by yourself from me, as Chairman of a Committee of Governors appointed to inquire into the due and efficient discharge of the duties of certain officers of the establishment, and praying that Parliament would inquire into the truth of the allegations urged therein; and lest the honourable Governor who is to bring forward the motion in suckion, should have come unprovided with of the petition, I beg, through the of jour pages, to hand him one. I park of dierespect or per-

governor, however

me in opinion,

same from others.

This noble institution, with its ample funds, would afford, under different and better management, a far more extended sphere of usefulness than it does. The conviction of this has prompted me hitherto in all I have said and done, and it will continue to do so until a correct system of management is adopted within its walls. With my brother Governors I desire not war, but peace, in the distribution of the bounty of the benevolent founder, and in the councils of the Almoners; but where 400 gentlemen, with a charge so soiemn as that to which they subscribe, consign their duties to the small body who meet under the designation of a (neglectful) "Committee," then it appears to me that peace on my part, or on the part of any of the Governors, is neither honest to the memory of the founder, nor to society at large. I am, Sir,

Very obediently yours,
WILLIAM BRACKSTONE TARBUTT,
Governor of Unrist's Hospital.
London, Nov. 25, 1835.

CHIMNEY-SWEEPER'S CANCER.

To the Editor of THE LANCET.

Sin,-You will oblige me by correcting an error into which your reporter has fallen, in publishing some observations which I made at the Medical Society of London, last week upon a case of Chimney-Sweeper's Cancer. I did not say that "the exostosis on the tibia of the patient well illustrated the proposition laid down by Mr. Abernethy." On the contrary I thought that circumstance accidental (probably congenital), and having no connection with the cancer on the scrotum, which I believe to be a local disease, brought on by the application of an irritant (soot) to that particular What I did say was, that I thought part. this case illustrated the observation of Mr. Abernethy (that cancer will invade every structure of the body), as it began in the skin of the scrotum, extended thence to the cellular tissue and glands of the groin, to the muscles, the periosteum, and even to the bone, the left pubic bone, which came in contact with the disease, being nearly destroyed.

But, Sir, my question to the Society is of some importance in the treatment of this disease, and with your permission I will now repeat it, to be answered by any of your correspondents; it is this: Is Chimney-Sweeper's Cancer a constitutional or a local disease? The case which I related would seem to favour the latter opinion, as no disease was found in any other organ of the body. I am, Sir, your obedient servant,

R. L. Hoopes, London Road, Southwark, 24th November, 1835,

DELIRIUM WITH TREMBLING. To the Beiter of THE LANCET.

Srn,-I was rather surprised at seeing a letter from Dr. Copland on Delirium cum Tremore in THE LANCET of last week, in which he claims the merit of having been "the first who distinguished two species of the disease;" and I was still more surprised at Dr. Copland saying, I am sure inadvertently, "I cannot find that I have made any reference to Dr. Elliotson's lecture on the subject." If Dr. Copland will again peruse the article in his Dictionary, he will find that he has referred, among his authorities, to Dr. Elliotson's very lecture mentioned in your foot-note. In the same lecture, and also in a clinical lecture published in THE LANCET for Nov. 13, 1830, a still earlier period, it will be seen that Dr. Elliotson not only had distinguished two great varieties of the disease, the one (the more frequent) not inflammatory, but requiring "to be treated with opium in full and repeated doses, backed by good nourishment, and sometimes to be combined with stimulants; the other decidedly inflammatory, and not to be cared without "bleeding and starvation," in fact, "requiring to be treated as you would treat phrenitis;" but he men-tions also a third variety, "where it is perfectly right to employ moderate antiphloall these varieties of the disease, and also the incorrectness of the name delirium fremens, which he said ought to be changed to delirium cum tremore, from the time he commenced lecturing at St. Thomas's Hospital, in 1825; and he was in the habit of mentioning a case, in illustration of the inflammatory type, which he saw many years before that time, in the person of a young county member, whose acquaintance he had made at Cambridge. Of course, I do not mean to imply that Dr. Copland did not also correspondent, relating to me : and as, it observe the varieties, because I know him to be a most honourable man; but it is evident that he was not the first to distinguish could condescend to reply to the author of them, any more than the first to suggest the such "facts" in any other mode than that alteration of the name.

I enclose my name and address, and beg to subscribe myself.

AN OLD PUPIL OF ST. THOMAN'S. London, Nov. 23, 1835.

. Itappears to us to be better to retain the term "delirium-tremens," in the present state of medical nonsenclature; first, because it is already in use; secondly, because it is more suphonous than the triple-worded as medical attendant and witness term; and, thirdly, because it is quite in thun from the estimate I enter accordance with the general analogy of own sense of Justice t doctrinal language. Delirium is the result must excuse me of a morbid condition of part of the human this "sense" of economy, and the adjective memory is ap- fee

pended (the Whole really making but out distinctive word, with a Applier in the court to denote a modification of that condition The two learned teachers may be justiful according to their own views of the dise in each adopting that particular physics (Latin or English) which best expresses their notion of the actual condition of the patient affected; but to say, as we presume they would, in advocating a change of terms that delirium does not tremble, is to detect a meaning in the old term which factording to circumstances) it scarcely even suggests As well might we say of inflammatory ferei or necessar palpitation, that those terms must be abolished, - the latter, for instance, because the polpitation is not nerv ous,—in order to say "pulpitation with nervousness," "fever with inflammation." We could cite a dozen such instances, but by thus changing terms we should convert them from names into sentences, which is no " the thing desired."

INQUEST AT FARNHAM. LETTER PROM MR. G. BURY.

To the Editor of THE LAXCET.

Sin.-I appeal to "your own sense o gistic treatment, and to give opinm also." justice and propriety," so loudly proclaime. Nay, Dr. Elliotson invariably pointed out in one of your editorial articles of Saturday November 14, to insert in an early number of your journal the paper sent herewith which has been called forth by the extraordinary mis-statements , to use the mildes term) contained in a letter to you from this town, purporting to bear an account of ar inquest lately held here, dated October 26th and printed on the above day. In the accompanying document I think you will fine most complete contradictions of all the socalled "facts" furnished to you by your my opinion, no man who considers himselrespectable, or would wish to be thought so adopted by me, or to notice any of his statements touching other points of the case, I shall crave your permission to pass on to the remarks made by you, or, more fairly speaking, by the writer of the leading article alluded to.

I take the liberty of addressing you, Sir, as being the editor of a public journal, and as having offered observations therein on a case in which I have been concerned.

spondent into your williams, in which a died justs is said to have delivered evi-ance of the remarkable nature therein at citied, without having made prior inquery at to its correctness, either of the cas in question, or some other party. You may object that you have been misled ar correspondent, in whom you placed ence, and whom you believed to be trustworthy. Be it so. But were you sufficiently acquainted with his character to warrant your accepting any statements he might choose to transmit to you? Or were you sufficiently acquainted with the relative station, in society and character, of your correspondent and the other medical men here, if, indeed, your new advocate for the necessity of medical coronerships can be called a resident practitioner, to justify you in publishing the like observations from one against the other? I know you were not. You could not have had such know-

mit me to ask you, on what are formed the opinions thus freely given? I have always understood, in my own simple judgment, that it is requisite and essential to be enabled to form an opinion before one can be have no doubt it made a powerful impressi given. But you heritate not in pronouncing yours without even having seen the evidence, or having been present at the inquest, -- an opinion that can be grounded only on the contents of the letter of your correspondent, from which per se (even if it were correct), every person competent to judge must admit your conclusions have been drawn too hastily, and from insufficient data. Your authority with regard to what was found in the stowach, as to how long it might have been in that organ, and how far it operated in being the cause of death, is, questionless, of great value; but, for my autestionless, or great value; one, or or or own part, I consider that of Dr. Christisson at least equal as a toxicologist, and if you will take the trouble to refer to the last edition of his excellent Treatise on Poissons, you will discover in pages 799 and 801, matter will discover in pages 799 and 801, matter on the poissons of the control of the edition of the edition of the control of the edition of th quite at variance with what you have ven-tured to assert so "certainly" and "assur-

Again, if "Mr. Pos(r) tello is entirely exonerated from blame," as you have avowed bim to be, how can it be "an act of malimenuelty to make him the object of susor reproach?" Or how is it possible an object of suspicion ?" a your paper, by school or reproached,

B jury

I doly you to bring proof of, or even to show malice or cruelty towards him emanating from any quarter. I remain, Sir,

Your obedient servant,

Farnham, Nov. 23, 1835. G. BURY.

Extract from the Printed Document alluded to in the first paragraph of the above

So soon as I read what alluded to me therein (in THE LANCET of Nov. 14th), I wrote to Mr. Woods, the Coroner, requestingincompatible with his official situation to reply to them. His absence from home prevented my receiving the following letter at an earlier date, together with a copy of my deposition taken at the inquisition over which he presided :-

"My dear Nt.—Having seen the garded case in The Lanvis, I must really family you with a copy of gear 4-position for gene own pricate information, assured that you will not give it publication. It ledge. Therefore, may I not well ask, where are your "justice and propriety," "in publishing the letter to be found at page 256?"

With respect to your "stating that Mr. Postfuelo accept the stating that Mr. Postfuelo does not appear to have incurred the slightest degree of culpability," and "there is not a tittle of crifeture in proof, that the child was poisoued," will you persist the child, from whom alone I received this information, that the child was poisoued," will you persist the child, from whom alone I received this information, that the child me whole of the statement is calculated to indicating public. He told me be released the streams. in positic. He told me be glessed the circumstance from the parents of the child. As your evidence is now before you, you will think it apperliance for me to answer the specific questions you have past. The vedict certainly was not wholly founded an your evidence, but as connected with other depositions, i

" Yours very truly, "HENRY WOODS.

" To George Bury, Esq."

Having received authority from the son of Mr. Woods, to submit the copy of my deposition, which I am not at liberty to publish generally, to the inspection of two or three respectable inhabitants. I have done so, and, in conformity with the recommendation of a disinterested person, placed it before the two gentlemen, whose names are apprended to the document which follows, the former of whom was selected as being one of the clergymen of the place:

That his evidence proves that the child could not suchious at the time he naw her.

"R. Sangar.

JAS. STEVENS.

" Farnbam, 21st November, 1834."

(The following are subjoined as the replies of Mr. Bury to the various statements of Mr. Rogers.-En. L.)

Declaration of Mr. Arthur William Woods. "I hereby declare that I was precent at the inquest at Earnham, held on the 17th of October Lat, and that? heard my father, the Coroney, ask Mr. Bury saverad times during the examination, whether he applied signer that may volution was the course of the death of the child, and Mr. Bury as often repfled this be could not swear to it, or in other words that is cuild not presonance such an opinion.

"ARREVA W. WOODS-

" Nov. 21st, 1838."

No charge was delivered. The Jury repuested the Coroner to withdraw before all the witnesses in attendance were examined. and in a few minutes returned their verdict, agreed on unanimously.

"The verdict certainly was not wholly founded on your evidence, but as connected with elker depositions, I have no doubt it made a powerful impression."—Mr. Woods's Letter,
"To any nothing of that part of the publication, which is so greatly untrue, viz. that J had stated a fact to Mr. Rogers of your having administered powders to the child."—Jobd.

The truth is, that I sent medicines to be given, if the child should alter for the better in the course of the night, from the effects of a blister which I applied. I told the Coroner and Jury I considered the recovery of the child hopeless, from the first moment I saw her, and when about to communicate what remedies were used, I was stopped by the Coroner, who remarked, "You did all you thought proper to be done," to which I assented, and he then proceeded with other parts of my evidence.

Declaration of Mr. Hewitt, Guardian of the Parish.

"I hereby affirm that I accompanied Mr. Bury at each of his visits to Mr. Portello's shop, previously to the inquest on Catherine Robison, and that on to the inquest on Catherine Robison, and that on neither occasion was he shown by Mr. Portello, or any other person, a bottle containing jalap in pow-der, or the situation of such bottle, or any such pre-paration, in the shop; and I also affirm that that substance was not even hanned to Mr. Bary.

" Nov. 18, 1835."

Declaration of Michael and Ann Robison, the Parents of the Child.

"We declare that we never stated to any one, or at any time, 'that the child became sick, yeary sick, year the medicine given by Mr. Bary, and that it was much convulsed after taking it."—We do

Assistant Overseer, 1835."

that it was much convuned after taking n. - we no also kereby aftest that the child had no nomiting, after Mr. Bury first saw her. MICHARL ROBISON.

The mark of ANN ROBISON.

Witness,

FARDENICK TRIMMER, statements.

An idea eniter in the minds of some the inhabitants of this town, that ny ev dence before the coroner and jary was a tended to criminate Mr. Portello, and I elieve he himself has imputed the design of doing so to me. To those who know m , I trust it is quite unnecessary to disclaim I aving had any such motive; but if others entertain doubts upon the point, the foll ring brief statement must remove them from every candid mind,

It was well known (and made known to

Mr. Portello also from my own lights the parish officers, to the coroner, and several others, that my suspicions of guilt, up to the hour of the inquest, fell upon another party, whom I will not name, since such suspicions have subsequently proved ground less. His name, as above attested by the Rev. R. Sankey, and James Stevens, Esq. was not mentioned to me, but the individua evidence touching him, came from other testimony than mine. The circumstance l am now going to relate, will indeed show that I really had friendly feelings towards him. Late in the evening before the day of the inquest, Mr. P. requested me to walk with him to the house where the child was lying, a distance of nearly a mile, and said

he would feel much obliged by my accompanying him, for he had some questions to put to the parents which no other person than a medical man could appreciate. I readily and instantly complied with his request. Mr. D'Esterre, my brother in law Mr. Hewitt, and Newell, the high constable, who were in his shop at the time he asked the favour of me, went with us. 1 confess I heard him put no other question to the parents of the child than this, " Why

In conclusion, I here repeat that my sole motive in publishing these observations and contradictions, is to vindicate myself from the charges involved in the foregoing mis-

did you not send for Mr. Bury sooner?"

G. Bury.

Farnham, 21st November, 1835.

COURSE OF LECTURES ON DISEASES OF THE BRAIN AND NERVOUS SYSTEM, BY M. ANDRAL.

In the next Number of THE LANCET will be published the first of a series o Lectures now in the course of delivery at Paris, by the celebrated M. ANDRAL, on the Diseases of the Brain and Nervous System, reported expressly for insertion in Tax LANCET, and published with the express permission and approbation of that re-out pathologist. We content ourselves by merely making this announcement, as the importance of the subjects to be treated in the lectures, and the celebrity. (who has devoted an immense portion of time exclusively to the by which they will be illustrated), recommend them to the a fession without a word of comment on our part.

4

THE LANCE

LONDON, SATURDAY, DECEMBER 5, 1835.

LECTURES

ON

DISEASES OF THE BRAIN AND NERVOUS SYSTEM.

NOW IN THE COURSE OF DELIVERY IN THE UNIVER-SITY OF PARIS.

By M. ANDRAL,

Aysician in Chief to the Hopital de la Pitie, and Professor, and Lecturer on the Principles and Practice of Médicine, in the Faculté de Medecine of Paris.

LECTURE I.

PRINCIPLES OF INVESTIGATION.

GENTLEMEN,-In the course which I am about to deliver this session, I propose to draw your attention specifically to diseases of the brain and its appendages; in a word, to affections of what is called "the nervous system."-those diseases which affect the organs of relation, commencing with the nervous system as the chief agent by which the various acts or functions of relation are produced and regulated.

Before we enter immediately upon the study of this most interesting class of diseases, permit me to present to you a few preliminary considerations on the difficulties by which the physician is surrounded in his pursuit of knowledge in this particular branch of medicine. The study of diseases not only on account of the obstacles which impede the advancement of medicine in

thological anatomy; but I know of no single work which may be said to afford any thing like a complete view of the question, which embraces all the facts that bear upon it, and at the same time does not leave untouched a great number of the most important and interesting points on which correct principles are to be founded. But the subject, difficult and arduous as it is, from its own nature, is rendered still more difficult from the various opinions and theories which prevail amongst the best physicians on almost every single question connected with the physiology and pathology of the brain and nervous system. It is not now the time to touch upon the disputes to which these have given birth, but you will have occasion to observe, during the present course, how very difficult it is to arrive at any thing like the truth, or syen to obtain a fixed idea on any point, amidst the multitude of conflicting opinions, and the host of contradictory facts, which we shall find stated and vouched for upon the most respectable authorities. Yet all these we must examine and discuss, with the hope of obtaining some determinate prin-ciples, carefully sifting opinions, and weighing and comparing the facts on which they have been founded. I do not mean to affirm that medicine, as a science, is exact or complete. No; I certainly would not venture to assert that. There are many points in the science upon which we are as yet by no means sure; but uncertain as our knowledge may be with regard to the causes and nature of several diseases, it is infinitely less sure, of the nervous system is peculiarly difficult, far less firmly based upon rational grounds, or supported by positive data, when the diseases of the nervous system become the obgeneral, but from various circumstances ject of our inquiry. In the study of any connected more intimately the system disease, or in the investigation of the disease itself. In the first place, the desire to of any particular part of the body, or any collect materials for the ground-work of any system, there are three or four circumcollect materials for the ground-work of any system, there are three or four circum-general views upon this subject, we find stances to which the attention of the phy-rurselves compelled to axamine a vast variety sickan is almost exclusively directed; and if works, and to spend an immense portion which he always endeavours to determine, the in the collection of facts, which are though he may not expect that his efforts through agreet number of authors, will always be crowned with nucesis. His three times, and published first object is to ascertain the causes which a state deal has been have determined the disease; his second is to h latter years, observe the external or internal symptoms littles of the which reveal its existence: his third is to

which the disease produces in the different of general troubles Hence, in diseases on the causes, the symptoms, and the pathology of the disease, he endeavours to fix upon a rational treatment. This is the manner in which we should proceed, were we to investigate diseases of the chest, of the abdomen, or of the circulating or any other system; but in diseases of the nervous system, we unfortunately find that the study of the causes, the symptoms, and the treatment, is surrounded with difficulties of a peculiar nature, which we do not find in any other class of disease. We shall now lay before you an account in detail of some of those difficulties, - not with a view to discourage you in the pursuit of professional knowledge, but in order to render your progress more easy, by pointing out at once some of the principal obstacles with which you will have to grapple, and prepare you to surmount or remove them.

If we begin by investigating the causes which determine the symptoms of other diseases, we have to consider first, the action of external agents; secondly, the reaction occasioned by the operation of several of those agents; and thirdly, the process or in-fluence which is called "sympathy." — a trouble produced in the functions, and often in the structure, of one part of the body, or of the economy in general, by derangement in the function or structure of another part.

Applying this division to the nervous system, we find that the latter is not influenced by the external world, or at least, is but little subjected to those changes which external agents incessantly tend to produce in other symptoms. The respiratory apparatus is constantly and of necessity exposed to the action of the atmospheric air, and to the various impressions, of a thousand sorts, which are apt to be conveyed through that medium. The intestinal canal is also daily exposed to the action of the various alimentary and other substances which are applied to its surfaces. But the central neryour system is, by a peculiar provision, withdrawn from the influence of most agents of this kind. It is, however, subject, in the the highest degree, to effects of the third species of causes to which we have alluded. Indeed, an attentive observer of the phenomena which take place during disease, must be convinced that we can have no organ slightly deranged, no function troubled, even in an insignificant manner, without a corresponding change being produced in the nervous system. No matter whether the primary change takes place in a fluid or in a solid of the body, in an organ essential to existence, or in an apparatus of secondary importance. The central nervous system, or that force which presides over life, partakes more or less of the disturbance. Its ordimary phenomens are then no longer manifested, and the economy evinces symptoms ligious persua

tissues; and, fuelly, by carefully meditating the nervous system is affected in a variet on the causes, the symptoms, and the padifficulty in pursuing the study of those d eases which are peculiar to it. Take, example, my disease, examine its symptoms, separate those which depend immediality upon the organic change from those nected with a lesion of innervation select a number of diseases indiscriminately, and see how many of the most important among them frequently depend upon the latter. In gastritis, in hepatitis, in inflammation of the lungs or the abdominal viscera, how many symptoms have we which can be referred to the mere inflammation of the part,-to the simple physiological change which occurs in the condition of its vessels? Examine the symptoms with care, and you will find that the greater part of them depend upon the trouble occasioned by the local disease, in altering or perverting the vital force,-that they are, in a word, socondary affections of the nervous system, which commands and directs all the other systems of the economy, -- which stamps its peculiar physiognomy on the primary disease, determines its character and gravity, regulates its march, produces its complications, and, finally, directs the therapeutic indications which we are to follow. In almost all the other organs of the body, we can find the cause of the malady in the structure of the organ. Pathological anatomy, cultivated as it has latterly been with ardour and perseverance, has laid open to us the changes which take place in the organic structure of the different apparatuses during the course of most diseases by which they are affected; but in the acryous system pathology furnishes little or no aid of this kind, and we are compelled to look for a number of causes of its diseases which are totally unconnected with physical modifications. Hence arises a principal difficulty in the study of nervous diseases of the system, which assome a variety of characters and types, under the influences of causes which, having no sensible effect that is appreciable to the senses, often escape our observation, or involve us in an obscurity which it is too often impossible to dissipate. Though our knowledge of nervous diseases may still be very imperfect, we are sufficiently advanced to affirm that the vary considerably, according to the different stages and periods of life; that they are modified by climate, and even by atmospheric changes; that the tendency to several nervous affections is augmented or influenced by the education and profession of the individual, and by numerous other moral agents, as must be familiar, every physician who has practised madis successively in the country populous capitals, like cording to the form

state, extending to the degree of civilization, and the spore or less extensive partition of enjoyments which operate with immediate influence on the moral man, we find that iseases of the nervous system become at me time intense, at another feeble, are conied to particular classes, or are diffused ough vast masses of the population. Discases which at one time were obstinate of treatment and frequent in recurrence, become at another time mild and rare. Affections with which we are now familiar, were seldom observed in earlier and more simple ages; while many nervous diseases have altogether disappeared and become extinct, from the different relations of man in civilized life.

This uncertainty in the form and character of disease, more peculiar to nervous disorders than to any others, from some of the causes we have just pointed out, must render it difficult to appreciate a great number of circumstances connected with them; but this is not all: even when we would determine the existence of any nervous disease, seek its place in the nosological scale, in a word, give a name and seat to the disorder before our eyes, we find ourselves surrounded | we have something more than a plus or a by a number of peculiar difficulties which minus; we have a condition that cannot be re-frequently frustrate our best-directed and ferred to exaltation or diminution of the vital most assiduous efforts. Some, perhaps the force; we have a change of quality in that principal, of these obstacles, gentlemen, force, an aberration, a perversion or depriarise from the absolute insufficiency of our vation whose influence is perceptible in al-means of investigating diseases of the brain most every affection, and whose existence and nervous system. Disease of an organ we cannot neglect without exposing ouris betrayed by a change in its physiological selves to all the errors of the Brunonian functions. The change of structure or of doctrine. The existence of this state of physical conditions in many of the chief or- ataxia in various disorders may be directly game apparatuses, makes itself known to our proved, in others it may be inferred from senses, and hence arises the admirable pre- analogy; thus in delirium, in several forms series, and merce arrives the nominator preinterpolation of diagnosis at which we have latterly of convulsions, &c., we have evidently an

upon the injured part, we can fix with wonis an aberration of the intellect, a deprivaderiful accuracy, not only the seat, but even ition of the vital force in that part of the the precise nature, of various disorders economy, and I can prove this from the very which occur in those two great cavities; but unture of the disordered function, but I can-the peculiar nature of the functions of the not admit that there is an excitement, or an brain and nervous system, the difficulty his elevation of a normal condition. service of results, and thus the brain or its appendages. lecases, difficult as they

A second obstacle which presents itself to us in our examination of diseases of the brain and nerves, arises from the absurd manner in which theory has been mixed up with observation. The number of facts collected is considerable, but their value has been much diminished, and their appreciation often rendered obscure, if not impracticable, from the unhappy tendency which too many writers have, to build up supposi-tions without any foundation, which they bring forward at every instant, and to which the true facts are frequently compelled to yield, or they are distorted into an apparent reconciliation. Thus for many years the study of diseases in general, and of the nervous system more particularly, has been retarded by a wish to explain all that we witness in the course of disease, by ascribing it to an augmentation or a diminution of normal excitement. No doubt in many disorders which have an hyperdynamie, or an adynamie, we find the vital force elevated beyond the normal type, or depressed below its natural standard; but in a great number of diseases we have a third state, which we cannot neglect without falling into numerous errors;

therto experienced of establishing any con-nection between the function of the organ which we meet in studying diseases of the and its structure, the absolute impossibility i nervous system, arises from the quew matance of applying our senses with any advantage that various organic changes in the brain, a to an appreciation of the normal or abnormal great diversity of lexions, may give rise to physiological conditions, - these and several nearly identical symptoms, and in the actual other causes compel us, in diseases of the state of the science we are compelled to use nervous system, to abandon the aid of our the utmost reserve whenever we would atmag, and have recourse to simple induc-tempt to explain, by the nature of the losisms. But this latter guide is uncertain: it found in the dead body, the functional de-publication to different investigators, an im-

You need not go deeply into the history of secomes still cerebral disease to be convinced of this ency of our truth. Let us take, for example, two individuals who are laboured and individuals who are laboured. examination of the dead body cannot explain | suit to trace after death the physical the various phenomena we observe during that may have be the cause of abcommisses of the nervous system; and if we paintent of the original males. In labor place to axclasive a reliance upon pathological researches, we shall become involved the elements which compose the brain vary in contradictions, from which escape is very from one period of life to another. Thus it difficult.

vancement of the science in discases of the and the brain itself presents an augment-brain, we may perhaps find it in the cir-tion of volume from birth up to the age cumstance that a great number of func- puberty. In the adult, again, the quantity tional disorders may really exist without of phosphorus which enters as a compo any change of structure sufficiently pro- nent into the chemical composition of the nounced to be observed by our senses after brain, is greater than in the child or in the death. This, I say, may possibly be the old person. The quantity of phosphoricase; the lesion of innervation may be sufmatter, inconsiderable in the child, acquire ficient alone to produce various troubles in its maximum in the adult, and again dini the economy, without heing accompanied mishes in old age. During the latter period by any organic derangement of tissue; how- of life the brain shows evident signs of ever, we should be inclined to suppose the diminished nutrition; its several diameter contrary from analogy. These lesions very are reduced by some lines, and its specific probably do exist, although they have gravity is from one-twentieth to one afteentl hitherto escaped all our researches. have, therefore, the greater need to increase. These are questions which as yet have our diligence, multiply our observations, only been touched upon as connected with and examine with most minute attention the diseases of the brain, but they deserve on slightest change not only in the arrange- serious attention. In the absence of anament and texture of the nervous system, tomical lesions, it is not altogether irra but also in its composition, and at the end tional to conclude, that perhaps some dis-weshall perhaps arrive at truths whose dis-cases of the nervous system may be ex plained by chemical changes in the substance We are indebted, as I said before, highly and complication of the brain; but this only

resides to copious and meated bleeding, them in the actual state of the science, this little measure is bended with de- Cultivate then, I say again, minute anatomy, odly injurious effects; the excitement, inread of being calmed by the loss of blood, pidly increases, and is soon followed by a fatal exhaustion of the vital power.

In many other diseases, also, some peculiar nervous state exists, which will not t of mood-letting. In chlorosis, for mile, we have signs of a nervous exaltation; but these are dissipated under the use of quinine, of cold effusions, of strengthening diet, exercise, &c., which bring back the harmony between the functions of the sanguineous cinissions would, on the contrary, only tend to keep up the disorder. Another difficulty in the appreciation of the effects of remedial agents in disorders of the nervous system, is the immense and varied power enjoyed by the imagination over almost all our functions; the force of a vivid imagination, the power of energetic belief, the influence of religious or superstitious impressions, are capable of producing and curing diseases, not only such as depend upon derangements of the nervous system, but others which have taken much more profound root in the economy. Of this, history affords us proof every day, without ascending to a period of remote antiquity, or the miracles of the royal touch. How easily can we explain by the imagination, many of the cures obtained from the magnetisms of MESMER, down to the infinitisms of homoropathy! It is the influence of this same imagination which constitutes the force of the charlatan, working a cure by invisible means, which is attributed to the nullities he administers: in a word, the influence of the imagination on the normal by a greater or less less of the motile power; and abnormal conditions of the human body, forms one of the most curious parts of the in the posterior columns, and here sensation history of man.

There are, perhaps, few professions which require a greater combination of varied and extensive knowledge, than that of the physician; and if this be true for the study of disease in general, we feel a still greater necessity, when entering on the investigation of nervous diseases, of preparing and clearing our way by a previous study of the other accessory sciences. Above all things, gentlemen, your efforts should be directed to the acquisition of anatomical knowledge; which you are contented in the commencement of your education, but of minute and delicate anatomy, which alone can enable us to throw any light on the changes of or-

and believe me that if you would pretend to advance this obscure portion of medicine, you must, above all things, be a profound anatomist.

The knowledge to be derived from comparative anatomy and from experimental physiology is also not to be neglected. In some cases you will observe the movements of the lower extremities extensively lost, though the lesion in the spinal marrow is comparatively insignificant; in other cases the loss of motion and sensation is less perseveral parts of the nervous system, while feet, although the injury of the spinal marrow may be carried to such an extent as to cause its complete separation into two portions: it is difficult to understand how this can take place, but without attempting altogether to explain it, I may observe, that in some fishes I have seen the nerves completely separated from the spinal marrow, and yet sensation and motion have been conveyed from it to the distant parts of the body, through a fluid.

We can also derive considerable assistance towards the clearing up of certain obscure points in pathology, from physiological experiments; thus we have been able to understand and explain a great number of interesting points connected with paralysis of the face, only since the period that experi-ments have demonstrated the different functions attached to the fifth and seventh nerves, Again, consider the great light which experimental physiology has thrown on the pathology of the spinal marrow; in man we have frequent examples of an injury affecting only the anterior columns of the spinal marrow and the functional derangement is betrayed in other cases the lesion is situated chiefly is the function which suffers. How could we explain this difference without the beautiful discoveries of some modern physiologists, who have shown that the posterior columns of the spinal marrow preside over sensation, while its anterior portion is chiefly destined to regulate sensation!

The difficulty of tracing the morbid phenomeus presenting themselves during life, to certain organic lesions, may, in some cases, perhaps, depend upon our not searching for the lesion in the place where it really not of the rough imperfect anatomy with exists, and this often, in turn, depends upon a neglect of physiology. Thus, in many instances, a patient goes blind without any sensible alteration in the structure of the eye. After death we examine the optic anization that take place in the brain and nerves, their commissure, the thalami, in a You will find this minute research word every portion of the brain supposed to most precious aid in your investiga-bear any relation to the sense of vision; and the parts equally free from any we at an interpretation of appreciable levion. In another case the transcady possess, with source of hearing is deranged, or altogether explaination of lost. We examine the internal car, the fewJeat of the floor of the fearth ventricle, and every thing presents a normal appearance : are we therefore justified in concluding that the loss of sight and hearing in these cases did not depend upon change of structure in the nervous system? I do not think so, gentlemen; we have omitted in our investigations an casential element; experiments have demonstrated that the fifth pair of nerves is an accessory nerve to the functions of the different senses; nay, more, comparative anatomy teaches us that the branches of the fifth pair may themselves become nerves of sensation in certain animals who possess organs of sense that do not exist in man, or in other animals placed low in the scale of creation, this accessory nerve actually becomes a sensitive nerve, and supplies the organs of sight and hearing: hence it is by no means tinprobable that in many cases of blindness and desiness, the loss of those two functions may depend upon a lesion of the fifth pair of nerves, or some of its branches, and not upon an injury to the principal nerve distributed to the diseased organ.

Thus, gentlemen, you see how closely these different branches of knowledge are connected together; how pathology is sided by comparative anatomy and experimental often seen the most interesting and importphysiology, and how necessary it is to cultivate these latter branches of the science if we would hope to take a distinguished part in the advancement of the former.

I have thought these considerations upon the various difficulties that present themselves in the study of nervous diseases, of sufficient importance to lay them before you, gentlemen, in some detail. Let us now explain, briefly, the criler we propose to follow in the present course. We shall first describe the different lesions of the central nervous system, commencing with the most simple forms, and thence passing to the more complicated; we shall then take up lesions of the nerves; and, finally, terminate with a review of those disorders which are generally attributed to a lesion of the great sympathetic nerve. We have already seen, as regards the other principal systems of the economy, that discases may be distinguished into Lesions of Function, and Lesions of Structure. The same principle of division holds good with respect to the brain, and we shall soon have occasion to demonstrate how the influence of this organ extends to all parts of the economy, modifying disease in a peculiar manner, and stamping all with a characteristic mark.

Finally, with regard to the spirit in which we propose to conduct the present course, we may say that its chief object shall be a just appreciation of facts. Some of these facts are premature, and as such cannot be taken into account; others are demonstra-1

mohis, the strice in the bits, and upon those principally shall our arth ventricle, and every thing deductions be femaled; others, again, are mal appearance: are we there-merely probable, but are by no means to be neglected from that circumstance. We are not of opinion with those who say that fa probable fact is no fact at all, " an fait preisemblable est un fait non avenu," contrary, many of these pos-ess a very great value, and instead of turning from them neglect, we should endeavour to verifuland appreciate them. Lastly, some facts are false and inaccurate; but even here I would remark to you that many facts are supposed to be so, merely because they do not agree with our own theories, with the ideas we have been taught to adopt : you must, therefore, weigh each fact with care and impartiality before you decide on its rejection, for nothing is more fatal to the science than that absurd cynicism which believes nothing that it does not see. Our last care, gentlemen, shall be to notice some of the principal theories which prevail with regard to disorders of the nervous system. We cannot pretend to expose all; we shall, therefore, confine our attention to the most plausible. I am not one of those who run after hypotheses and theories, but as a teacher it is my duty to lay them before you, and thus keep para with the progress of the science, for we hav. ant discoveries, whose authors commenced by inventing hypotheses, and terminated by proving them.

ON THE

NATURE AND QUALITIES OF FLAME.

By W. REID CLANKY, M.D.,

Sunderland.

WHEN a simple body is burnt, the fiame is uniform throughout; but when compound bodies are burnt, the flame varies considerably, depending upon the nature of the combined gascous substances inflamed, and producing a variety in the intensity and colour of the light.

As a familiar example, I will commence by giving a correct account of the phenomens of the flame afforded by a candle, and by way of explanation, append a diagram of that flame, afterwards describing the experiments which led me to the constitution I have adopted, and the appearance

Surrounding ?

3

Arabic characters (3.2-3), we always find a clear bide flame which chars the wick from the moment it is lighted, and in forming a base for the light-giving flame, at this point, the two flames show a blue-white light at ir juncture.

inmediate ly surrounding the top of the wick we find w conical space (2), which forms a centre to the yellowwhite flame, and which is less transparent and less luminous than the yellowwhite fisme, immediately surrounding it.

Round the space (2) we observe the yellow-white or light-giving portion of the fiame, which is also conical (3.3.3), as all

heated gases are in ascending, by reason of the uniform pressure of the atmosphere.

Surrounding the last-mentioned lightgiving atmosphere (4.4.4) we find an atmosphere which is, generally speaking, invisible to the eye, except we use a large coarse candle in a very dark room. This atmosphere is diaphanous, and surrounds the light-giving flame at every point.

effect any change in its appearance. In the candies, oil-lamps, and gas-lights, atmosphere [4.4.4] which, as remarked above, is also invisible, we find that the wire instantly becomes yellow-white, from pabulum flammer, a portion of it is, during the probability of the control of the contro flame.

Immediately within this invisible flame augmentation of the light at the base of the we find (3.3.3) the light-giving flame, and flame. at this film, or atmosphere, of yellow-white flame, the wire becomes red-hot only. In the centre or the obscure part of the flame in the open air, it has, also, its invisible of the candle (2), we do not find that the flame, and over this there is an atmosphere brass wire is so much heated as to give it the tint of what is called "cherry-red." Indeed, I am of opinion that were it not for the conducting power of the wire itself, this obscure portion would not give to it any approciable augmentation of heat; for, assuredly, this opaque or central portion of the flame, is not in a state of combustion, as Expect to be able, very shortly, to demon-When we place before us a candle terription which has been burnt for and extinguished in the usual

ance of ignition is a clear blue flame, which I have discovered by experiments to be car-bonic oxide gas. This blue flame, as it continnes to burn, will augment in extent, and soon afterwards will show a white flame upon the top. This white flame will gradually augment until it become the lightgiving flame of the candle.

The base of blue flame gives out a powerful heat, which not only chars the wick, but also melts the tallow of the candle, and this melted tallow is pumped up, as it were, in the heated interstices of the wick in the manner of fluids in all capillary tubes. At the top of the ignited wick we may readily observe, without the aid of a lens, the inflammable gases springing up into the course or opaque part of the flame (2), which may be seen more readily after the wick has been snuffed. This liquid or melted tallow, being composed of carbon, hydrogen, and oxygen gases, is manufactured by the heat of the flame, and becomes an empyreumatic oil,-olefant gas, bi-hydruret of carbon, and carbonic oxide gases, suspending a consider-able portion of free carbon; and these substances, when in a state of combustion, we call "flame."

Carbonic oxide gas is formed whenever carbon is burnt without its receiving the Externally to this invisible flame we find needful quantity of oxygen gas to cause it another still (5.5.5), which is composed of to pass into carbonic acid gas. Carbonic nitrogen and carbonic acid gas, but as, of oxide gas is remarkably inflammable, and this atmosphere, and of all other parts of takes fire in the open air when it comes into the flame, it will be my duty to treat more contact with iron at a cherry-red heat. It at large, I will commence by stating, that is, therefore, in the first instance, burnt at when we hold a piece of fine brass wire the base of all flames into the composition across the flame of any description of candle of the gases of which it enters. as we may or oil-lamp, the atmosphere .5.5.5, does not observe in the familiar instances of lighted

the great heat afforded by this invisible combustion, attracted into the body of the blue or carbonic oxide flame, and there contributes, in a very beautiful manner, to the

> When carbonic oxide gas is burnt by itself containing carbonic acid gas. The invisible flame of carbonic oxide gas has exactly the same properties as the white or light-giving flame when it is burning in a cylinder of wire gauze, except that no water is formed in the combustion, as hydrogen gas is not present.

I now enter upon the subject of inquiry in respect to the nature of the opaque portion of the flame, marked 2 in the diagram.

Into a piece of wire gauze (vide diagram)
I inserted a brass tube four inches long, and so first appear- the eighth of an inch in caliber.

It will readily be understood that when I held the piece of wire gauze horizontally, so as to cut off and consequently extinguish the upper half of the flame, the centre or opaque part of inflammable gases not being ignited, would be conducted up the brass tube in the manner of a chimney. When this was neatly and steadily performed for a minute, I could readily ignite these gases as they spring from the centre of the flame, and I always observed that the flame at the top of the tube was re-markably brilliant. Upon conducting these gases into a tube of glass open at top and bottom, I was enabled to collect a sufficient quantity thereof for experiment, and I found that it consisted of the pabulum flamme, above mentioned,-that generally the olefiant gas was in excess, and hence the seconds. strength and beauty of the flame. In all found no oxygen gas in this opaque portion of the flame. Indeed, it could not be expected to be found there, because, as I have stated above, this portion of the flame is not in a state of ignition (which would not be the case did it contain oxygen), and because in the combustion in the body of the wick, which converts it into a state of charcoal, all the oxygen contained in the tallow, wax, or oil, is expended in this combustion.

We now come to the yellow-white or light-giving portion of the flame (3, 3, 3). This fiame surrounds the opaque or central portion of the flame, except at that part at which it comes into contact with the base of blue flame. This flame, as may now be readily understood, is composed of the substances above-mentioned contained in the centre or opaque portion of the flame. In a word, this is the only true light-giving portion of all flames, and has its depend-ence upon the invisible atmosphere (4. 4. 4) tubes, which project from a bulb, into the which surrounds it, and to which I must latter of which lime-water is poured (by a now advert.

Surrounding the light-giving fisme, and the base of blue flame, we always find an the tubes to any part outside the invisible flame. This favisible flame will, in flame, is such a me some degree, become visible when we cut a black card into the exact form and size of

the light-giving fame, and, in an otherwise dark room, completely edipes the light giving flame. In such case, though fiame be scarcely visible, we may observe that it is uniform throughout, and is abou the eighth of an inch in thickness. This invisible flame is of the greatest import ance, for without it we should have no As whatever.

From numerous experiments with the wire-gauge and brass-tube apparatus, I am satisfied that, at every point, highly heater free carbon is attracted from light-giving flame, and is burnt in the atmospherica air surrounding the flame on all sides, and which air is at all times moving in a curren over the flame, from below upward, so that as fast as the atmospherical air affords sufficient oxygen for feeding this invisible flame, it, viz. the heated surrounding atmosphere, is carried upwards, by reason of its expanded state, effected by the intense hear at all times given out by this invisible flame

This invisible flame instantly fuses fine brass wire, which the white or light-giving partion, in some instances, requires a considerable time to accomplish. I am wel assured that this invisible flame is perfect throughout, as I have examined it carefully with powerful lenses; and, also, that by the great heat which it gives out, the inflammable gases of every description are burnt, and that without it, flames of every description could not continue for three

When we blow upon any flame, with instances I found a considerable quantity of heated air, we drive away this invisible or free carbon suspended in these gases. I heat-giving flame, and if we continue to blow, we next drive off the white flame, and, lastly, the centre, or magazine of inflammable gases, and thus mechanically extinguish the flame, but not by the current of "cold air," as Davy and others after him supposed. Of this more hereafter.

Over the invisible flame we have another atmosphere (5, 5, 5, 5), of which I will now give some account. The smallest engraving represents a glass apparatus exactly of the same size as here represented.

small funnel), which is represented by dividing line. I hold the aperture of a nes through the He

remain steady, in the glass bulb. I suite of er, in other words, the light will be allow this burrent to be established for a few settled and then place the fore finger of the right fished upon the aperture of the suite fished upon the aperture of the suite fished upon the speriture of the sum of the same mentioned above, we shall find that the had been next to the flame. I now very cautiously agitate the lime-water contained in the bulb. In all instances I have uni-form found, that the lime held in solution in the lime-water became visible as a carbonate, by reason of its union with the carhonic-acid gas, conveyed by this glass apparatus from the atmosphera immediately surrounding the invisible flame. This at-mosphere of carbonic-acid gas I estimate at one-tenth of an inch in thickness.

As mentioned above, this atmosphere is carried upwards as fast as it is formed, for the reasons there given. Hence the necessity of the constant supply of oxygen gas which our atmosphere affords, and hence the brilliant combustion which takes place when mation or nonformation of this invisible

The invisible flame is destroyed when we the cooling power of the wire gauze. hold any incombustible substance against it, formed, and when we press the incombus- if trust, he entertained. tible substance forward at that place, the Having visited several very "fiery coal-yellow or light-giving flame is again de-stroyed, and so on until the light be totally hewing coals they seklow cast an eye to extinguished or destroyed. When we ar- their safety-lamps, and if they did the dense the flame, we shall find that a consider-observing the phenomenon of fire-damp able portion of free carbon will be precipitated upon the incombustible agent. When there is, in nineteen cases out of twenty, no we place an extinguisher upon any flame, augmentation of light when fire-damp hurra we will find that it does not come into in a Davy-lamp, as I have had reason frecontact with the flame, even though it quently to remark. Besides, if fire damp be extinguished, because a sufficient portion of oxygen gas is not allowed for the wire gauze becomes oxydated, and, falling formation of the invisible flame. These in pieces, cannot prevent the flame of firephenomena take place with flames of all de-damp from passing. Should an accident, scription into which carbon enters. I need such as any pitman's working-tool, unwitscarcely remark that the purer the atmo-apheric air, and the greater the portion of the Davy-lamp, during the prevalence of carbon which enters into the composition of fire-damp in a coal-mine, the flame of course the above named gases, the more powerful, would pass thereby into the atmosphere of cateris paribus, will be the combustion or ex- the mine; or should any part of the wire

as Sir H. Davy recommended to be cm- source of danger arises from the following ployed in his saiety lamp), to any flame in caux: When the five-damp is mixed with which carbon is burnt, we shall thereby prevent the formation of the invisible flame within mine, the flame in the Davy-lamp burns so the wire gause, and another invisible fiame steadily, and with such power, that should

hand upon the aperture of the tube which fame (no matter of what description it may

be) will pass the wire-gause barrier. Sir II. Davy, and, after him, many eminent chemists, supposed that the prevention of the passing of flame by the wire gauze which he employed in his safety-lamps, was effected by the "cooling power" of the wire gauze, but this is not the case, as my experiments in this paper testify.

We know, from what I have stated above. that if the invisible fame be prevented from being formed by the above-named agents, so that there may be a deficiency of oxygen gas in Davy's safety-lamp, combustion cannot be continued, and hence the comperative safety afforded by this lamp. But it is needful to assert and maintain that the forinflammable substances are burnt in oxygen flame accounts for all the phenomena which that distinguished philosopher referred to

The more this position is known, and, and, consequently, the yellow flame recedes indeed, I may say, the more that my expeat that point, or, rather, is destroyed. In-riments are tried by competent judges, the stantly afterwards a new invisible flame is greater assurance of their correctness will,

rive at the opaque or centre portion of atmosphere of coal dust would prevent their plasion of these gases.

LAW OF MORTALITY

EACH COUNTY OF ENGLAND.

By T. R. Edmonds, Esq., B.A., of [finity College, Cambridge.

THE knowledge of the laws which regulate the collective vitality at different ages of the population in various districts of England, is evidently an object of the highest interest to physiologists. When those laws are established, and when the peculiar circumstances of each locality have been investigated, we may reasonably expect soon to arrive at a knowledge of some of the chief causes affecting the prolongation of hutexture than in the proportion of twenty- man life. Having minutely examined the cight to thirty, in both warp and woof, as great many of facts accumulated in the eight to satirty, in note warp and woof, as great mass of facts accumulated in the Davy himself proved, we shall find that the English Population Returns of the years 1821 invisible flame will, by such apartures of invisible flame will, by such apertures or and 1831, I can speak with confidence of the meshes, be permitted to be formed outside high value of the information which they the wire-gauze cylinder, which cylinder, in contain. The results from one hundred scthat case, cannot be considered a barrier to parate observations of males and females, that case, cannot be consistent with each other, and in har-power" is out of the question, and, as in all mony with previous observations, when other cases, does not afford the true expla-viewed in connection with the new theory of As I have not drawn up this paper for 605 and 614 of THE LANGET. There exist, the perusal of the learned readers of THE however, in different localities, considerable LANCET, in order to show the value of my variations in the mortality at different ages, new safety-lamp, but for the advancement and in the relative mortality of the two of science, I will conclude by remarking, sexes. The causes of these variations, whethat by the use of my new safety appa- ther dependent on atmospheric or other exratus, all the contingencies which are men-tioned above in respect to the Davy may on original peculiarities of individual con-be avoided; and as the Davy is in general stitution, is a subject well worthy to everstitution, is a subject well worthy to exercise the ingenuity of physiologists.

Before proceeding to the general investigation of the subject, it may be interesting to state a few of the principal results hercafter to be established. In comparing together different counties, the characteristics of each peculiar law of mortality are marked by the mortality in three principal divisions cage, but the moment fire-damp burns of age; namely, in the period under five within the cylinder of wire gauze, the piece years of age, in the period between fifteen of fine wire is fused, and the whole cage is and sixty, and in the period above sixty instantly surrounded by the safety cylinders. years of age. In all counties, out of a given number living above the age of sixty years, The printed Minutes of Evidence, and the same. In some counties the mortality be-Report of the Parliamentary Committee tween the ages of fifteen and sixty years is appointed to inquire into the lamentable nearly half as much greater than in many nearly half as much greater than in many other counties. In some counties, out of a ring in the Mines of Great Britain, with the given number born, nearly twice as many view of succertaining the means of preventing the recurrence of similar accidents, have other counties. In all counties age, in the propo

a the galdity of counties at ages greater from the total assumed by Mr. Rickman than sixty grace, the mortality of males selonly one-twentieth part.

Som exceeds that of females more than three It is certainly highly desirable that the per cent. In the majority of counties the mortality of males between the ages of fifteen and sixty years is less, in a small degree, than the mortality of females. The most remainable result presented by the population returns, is the fact that all the counties wherein the mortality of females between the ages of fifteen and sixty years is at a maximum, are found on or near the same straight line. A low mortality between the ages of fifteen and sixty years is the best index of a healthy population, because the individuals of this class are of much higher political value than the individuals under five years or above sixty years of age. As an index to the healthfulness of a locality, the law of female mortality is to be preferred to that of males, because the various occupations of the latter may exercise an important influence on the mortality. The line of greatest mortality of females between the ages of fifteen and sixty years, is a central one, running in a north-west direction The most from Brighton to Liverpool. healthy counties are those most distant from this line, with very few exceptions.

The materials on which the present obthe ages of the dying in all England and Wales during the eighteen years 1813-30, combined with one enumeration of the living, and their ages made in the middle of the year 1821. The only important defect in these materials is the omission of a considevable and uncertain number of deaths. The returns made show the number of deaths which have been entered in the parish registers only; and we are left with very little information respecting the numbers omitted through negligence, or omitted because buried in the grounds of dissenters, or in private burial-grounds. Mr. Rickman, who compiled the returns, estimates the deficiency in the deaths to be 8 per cent. less than the true number for the whole of England and Wales. The results which I am about to give for thirty-nine counties of England, are founded upon the assumption that the registered deaths are deficient ten per cent. from the truth. I have supposed that, out of every twenty deaths which have occurred, one is omitted through negligence, and another because the burial occurred out of the church grounds. In the counties of Middlesex, Surrey, Monmouth, and in Wales, have estimated the deficiency at 20 per ent. Mr. Rickman having expressed his that the deaths are more deficient in in other districts. The consegy for the whole of England smount to 121 per cent.

It is certainly highly desirable that the number representing the absolute annual mortality at all ages should be correctly ascertained. I believe it to have been ascertained within 5 per cent. of the truth. But even if it should prove defective to the amount of ten per cent., the value of the results hereafter stated will be very little affected thereby: for they would in that case equally well indicate the relative mortality at different ages of life, and in different localities, which is the only important question to physiologists. The materials supplied enable us to establish, beyond dispute, the relation subsisting between the mortality at one interval of age, and the mortality at every other interval of age. If the absolute mortality at any one age, or at all ages, in the aggregate be known, the absolute mortality at every interval of age is also known.

In order to obtain the law of mortality prevailing in each county of England during the eighteen years 1813-30, the facts requisite are, the total number of deaths occurring during that period, distributed in quinquennial or decennial gradations of age, together with the mean population who have been alive during this period also distributed servation is founded consist in a return of according to the same intervals of age. Dividing the number who have died in any interval by the mean number who have lived in that interval, we obtain the exact number who have died in eighteen years out of a given number constantly living in that interval. A series of numbers thus obtained for each consecutive interval of age would represent the true law of mortality of the population observed. Dividing the results by eighteen, we should have the law expressed for one year, in which form it is most easily compared with the results of other observations. If the results be also multiplied by 100, we should arrive at that form of expressing the fact which is adopted by the best authorities. For example, in the following table the mortality of females in England and Wales, during the eighteen years 1813-30, between the ages of fifty and sixty years, is stated to be 2.16, which is intended to represent the fact that this is the average number of deaths occurring annually for every 100 persons constantly living between the ages of fifty and sixty years. If the materials had been perfect, this number would have resulted from dividing the dying 132,918, by the living 352,160, and dividing the quotient by 18. The result of these operations however is 2.10, which differs from the number above stated, in consequence of necessary correction having been introduced for defects in the materials.

Having stated the nature of the materials it, the estimate of as they would be if they were complete, it is of deaths which remains to state the degree and manner Fire total, differs in which they are defective from the true

The apparent mortality of males in all England and Wales, has been diminished by .09 between 20 and 30, and by .06 between 30 and 60 years of age, on account of the unenumerated maritime and military population. In the six large towns a greater correction is necessary, but none has been applied.

mortality deduced for females between the mate is founded upon a probable fact, and ages of fifteen and fifty years, may be leads to results in harmony with all other living, be understated to the amount of two correctly given, and the ages of the living only are understated, then the apparent mortality between thirty and forty will be correct; whilst the mortality between estimate of the number of births and deaths twenty and thirty will be lower, and the in his parish unentered in the register. A mortality between forty and fifty higher than the truth. Adopting the intermediate supposition that the ages of the dying are understated to only one half the amount deaths of which there exists an estimate mortality under the age of forty will be very nearly correct.

It has been already remarked, that the numbers representing the absolute mortality at each age in my present tables, are founded upon the assumption that the registered deaths are deficient twelve per cent. from the population. This proportion the truth, and that Mr. Rickman has esti- regarded as a valuable mated this deficiency at eight per cent. The supposition that the estimate of Mr. Rickman is not founded lation is due entire upon any fact, and leads to results contra- over deaths, the

It might be supposed probable that the idictory of facts which he admits. My estisubject to error from the disposition of stated facts. Mr. Rickman agrees with me females to understate their ages. The error in supposing that the increase of the Enis apparently of very small amount. If the glish population is entirely due to the excess ages of all the females, dying as well as of births over deaths, or that the immigration from Ireland compensates the emigrayears, the mortality at each of the three tion from England. Assuming this as a decennial intervals from twenty to fifty fact, the truth of my estimate and the error years will be five per cent. higher than the of Mr. Rickman's are easily demonstrable fact. But if the ages of the dying are by means of the proportion stated to exist between the unregistered births and deaths.

In the population inquiry, questions were addressed to each clergyman requiring an portion of the clergy made such an estimate. another portion offered no estimate. The absolute number of "unentered" births and that the ages of the living are, the female is evidently of very little value, because we are ignorant of the proportion of the total population from which this estimate was obtained. It may, however, fairly be presumed that the proportion of unentered births to unentered deaths would have been the same for the whole, as for this

tion is known. Mr. Rickman's estimated unentered births and deaths is 551,200, the deficiency in the deaths is, however, de-increase of the population to be accounted rived from the apparently groundless as for as stated above, sumption, that the total deficiency in the deaths was just double the number of which during the eighteen years will then be an attimate was returned. Because the 3,956,168, and the true number of deaths partial estimate amounted to four per cast. 2,227,956. The female population alive at the middle of the eighteen years, or at the made an estimate, the deficiency would end of the year 1821, was 6,198,200. Conhave been eight per cent. He then shows, sequently the average annual deaths of as a consequence of this assumed deficiency, females was 2.06 per cent., or one out of that the unentered births were to the un- 48%. The average annual births of females entered deaths in the proportion of four to was 3.55 per cent., or one out of 28. The one. He entirely disregards the fact elsewhere stated, that the mentered births were cent., and the deficiency in the deaths to
to the mentered deaths as two to one, which 12 per cent. According to Mr. Rickman, proportion would have indicated a defect of the deficiency in the births was 19 per cent., twenty per cent. in the deaths, as I have and in the deaths 8 per cent. According to shown in No. 614 of THE LANCET.

partial estimate of the different clergymen is that of 172 to 100: according to Mr. indicates that the number of uncutered Rickman the proportion is that of 175 to indicates that the number of unconversely births was just twice as great as the number of unconversely deaths. If London be The population returns of 1831 abound ber of unconversely between the unconversely with contradictory statements made by Mr. ber of unenered deaths. It formed better the proportion between the unit with controllectory statements made by Mr. entered births and deaths was that of three Rickman, founded upon the obviously false to one. This best proportion I have adopted hypothesis of the population having been as true for the wirds of the latest and wholes, "stationary," and that the annual births because it is applied by on a tanks of bad been equal to the annual deaths for a estimated deficiency in the deaths is founded, cal periodical he has recently bestowed a I have confined myself to the observations great deal of unnecessary pains on the on the female sex, because the increase of demonstration of his own errors. England and Wales at all ages 32 occur be-The total number of "unentered" ob-low the age of five years, he has stated as a tained from those parishes which made an fact that out of 100 born, 32 die before they complete their fifth year. The true statement is, according to his own showing, that

> occurred in England during the period of named that the true defi-lemales for all Eng-little value, because it would differ in an to 275,500, then insignificant degree from a theoretical table

which I published more than three years years. If the portlation had been sta-moreover, there is reason to believe though the provided in the provided proves the provest of these numbers and provest the provest of the provided provided provest of the provided upon general principles, will be a better indication of future facts, than a table exactly representing one fact out of a great series of facts. The mortality of the female population of England is represented as near the truth as can be desired for any useful purpose, by my table of "Mean Mortality, when the limiting age of the period of "infancy" is taken at seven years. In the published table I have fixed this limit at eight years, which is the true limit for the male population of England. To adapt this table to the female population no alteration has been made except at ages under eight years. The results of this altered table agree very nearly in three important points with the results of the English observations for females. According to the table and according to the fact, the mortality between the ages of five and ten years is 20 per cent. greater than the mortality between the ages of ten and fifteen years. According to the table, there die annually 4.47 out of every According to the fact, when the registered deaths are assumed to be deficient 124 per cent., the mortality of females under the age of five years was 4.60 per cent. According to the table, out of 100 born 19.5 die before they complete their fifth year of age. According to the fact when the registered births are assumed to be deficient 21 per cent., out of 100 born, 19 die before they complete their fifth year. The near coincidence of these results is satisfactory evidence of the general consistency of the materials, and of the conclusions deduced from them. It may be useful to state that the "expectation" or mean duration of life, at birth is 43.70 years according to the table of Mean Mortality, when the limit of "infancy" is fixed at seven years. If the English female population had been stationary, or if the annual births had been equal to the annual deaths for a long period of time, there riod." In every population, whatever may would have died annually at all ages during be the absolute mortality, the relative morthe eighteen years 1813-30, one out of every 43.70 living. But on account of the increase of population, the actual annual mortality In the Table of Mean Mortality I have fixed was only one out of 481.

On the supposition that the registered deaths are deficient 12‡ per cent., the mortality of the English population between the seventy and eighty years of age, agrees very nearly with that of the table of Mean Mor- mortality between forty and fifty years, in tality. According to this table, 204 living the proportion of three to two, as it is also between the ages of sixty and seventy are in the Table of Mean Mortality. Notwithreduced by deaths in ten years to 100 living standing this extensive coincidence, the pobetween the ages of seventy and eighty sition of this limit is not to be regarded at years. According to the fact stated in the having more permanency than the post returns of 1821, there were of both sexes of the inferior limit. 201 living between sixty and seventy for year in the position of the every 100 living between seventy and eighty volves a change of

coincidence of these numbers and prove that the absolute mortality at the interval has been truly stated, and is represented by the Table of Mean Mortality. If the absolute mortality is correctly stated at any one interval, it is correct at every interval of age, because the scale of relation connects together the mortality at different ages is indisputably established. That the population was stationary at the period in question, or that the living in 1821 between the ages of sixty and seventy proceeded from the same number of births as the living between seventy and eighty, appears to be highly probable. At least this was certainly the case in London, and there is no ground for supposing that the rest of England did not resemble London in this respect. Those living in 1821, between the ages of seventy and eighty years, were born in the 'ten vears 1741-50, and those living between the ages of sixty and seventy were born in the ten years 1751-60. Now, according to the London Bills of Mortality, during the ten 100 constantly living under the age of five years 1730-39, the number of haptisms amounted to 170 thousand. In the ten years 1740-49 they amounted to 146 thousand; in the ten years 1750-59 they were 148 thousand; and in the two following decennial intervals the haptisms amounted to 160 and 173 thousand respectively. It may hence be inferred as highly probable that the English population in 1821 was decreasing between the ages of eighty and ninety years, stationary between sixty and eighty, and increasing under the age of sixty years.

The new theory of mortality is founded upon the discovery of three numbers, respectively presiding over three well-marked periods of human life-before, during, and after, the existence of the procreative power. To construct a theoretical table, the absolute mortality at any one age must be known, together with the position of the inferior and superior limits of the " procreative petality at different ages is the same, when the position of these two limits is the same. the superior limit at the age of fifty-five years, which happens to be the true limit in each of the nine independent observations above stated. In all these observaages of sixty and seventy, and between tions, and in every county of England, the mortality between fifty and sixty is to the

371

MR. TAGERT'S CASE OF GANGRANA SENILLS.

tive mortality; the se variation in the and according to theory, as may be perposition of the inferior limit involves a ceived by any person without calculation. Under the age of one year, the theory is change cast per cent. in the resauce mor-tality. It constructing the Table of Mean Mortality, I ventured, in opposition to all direct evidence on the subject, to put back the inferior limit one year, and thus effected a diminution of 32 per cent in the rective mortality under the age of nine years. My prediction has been confirmed, and more than confirmed three years after its publication, by the present observation on the English population. According to all previous observations, the inferior limit, mortality, was at nine years-the mortality few weeks immediately succeeding birth. between five and ten years being always twice as great as the mortality between ten and fifteen years of age (as it is now in the large towns of Eugland), which agrees with theoretical tables wherein the inferior limit is fixed at nine years. In the table of "Mean Mortality," I assumed the inferior limit to be at the age of eight years, which is the limit now applicable to the total male population of England; the mortality between five and ten years being 50 per cent. greater than the mortality between ten and fifteen, according to fact and according to the table. But for the female population the limit is at the age of seven years, for the mortality between five and ten is only 20 per cent. greater than the mortality between ten and fifteen, according to fact and according to a table wherein the age of seven years is assumed as the limit. In Belgiam the position of this limit is now at the age of eight years and a quarter for both sexes. The grounds of my accomplished prediction were the following :- From the ages of the living under fifteen years, and from the rate of increase in the births, indicated by the population returns of 1821, I because convinced of the fact, that the mortality under the age of ten years was less in an extraordinary degree than had ever been supposed to exist. I knew also that the diminution in the mortality during infancy was amply sufficient to account for the reduced mortality in England at all ages. Knowing then that the mortality was considerably diminished under the age of ten years, and not diminished above that age, I accounted for it in the only way consistent with the new theory. The truth of this theory has now been confirmed by the highest order of human evidence, for it has enabled me to predict the precise manner in which a new and extraordinary diminution of the relative mortality in infancy has been effected.

In every county of England the proportion of deaths occurring at annual intervals tween the ages of one and six years, agrees

1

correctly applicable to the county of Cornwall only. In all other counties, the proportion of deaths under the age of one year is much greater than that indicated by the theory. Four years ago, in the preliminary observations to my "LIFE TABLES," I expressed an opinion that the theory would not represent the fact in all cases under the age of eight weeks. I believed then, as I believe now, that the high mortality under the age of one year will be found to consist or the mean age of attaining the minimum in an excessively high mortality during the

As the subject which I am discussing naturally divides itself into two parts at the point now attained, I shall here arrest my remarks until the publication of another Number of THE LANCET will admit them to appear.

46, Regent Square, Nov. 7, 1835.

CASE OF

GANGRÆNA SENILIS,

IN WHICH THE POST-MORTEM EXAMINA-TION DISCLOSED A

COAGULUM OF FIBRINE ADHERENT TO THE AORTA.

To the Editor of THE LANCET.

Sir. - If you consider the outlines of the following case worthy of being recorded in your truly independant journal, I shall feel obliged by its insertion. It is, in my opinion, calculated, in some degree, to illustrate the pathology of a disease which is too frequently fatal .- I am, Sir, your obedient servant,

W. TAGERT Surgeon to Mercer's Hospital, Dablin.

CASE. - Catherine Strahan, aged 66, of a delicate and feeble frame, was admitted a patient into Mercer's Hospital, on the 25th of September, 1835. She then suffered from distressing diarrhoa, and complained much of pain in the left leg and foot, accompanied by a constant sense of coldness. This coldness, and the pain of the extremity, with occasional diarrhoea, afflicted her about a month previous to her admission. The pain was so urgent as to interrupt her sleep. She attributed her sufferings to rheumatism, and kept the limb wrapped in flannel. She did not suffer from pains elsewhere, but her general health was broken. On admission. Lave stated to he the universal the leg and foot presented a natural appear-The deaths in any two ance, and she stated, that when suffering are always in the from cold, the limb assumed a livid hue to according to fact The diarrhora was relieved by the ordinar; treatment, but the pain and uncasiness of figure, which were thatly elevated, contain-the limb continued unabated, and became ing an earthy or takeous deposit. This daily more urgent. On the 1st of October, almost a week after her admission, a darkish livid bue was observable on the integuments of the left insten, which felt colder to the extended to the outer ankle, and, after two or three days, involved the entire foot. this period there was no sign of vesication about the toes. On examining the femoral artery in the groin, a slight thrill could be distinguished. Its pulsation was evidently weaker than was the pulsation in the opposite limb. The pain was now very severe, with nocturnal exacerbations. The extremity was wrapped in cotton, and oiled silk was placed outside this, and anodynes were administered to alleviate her sufferings. The lividity extended up the limb, day after day, and vesications soon formed on the leg and foot, from which there was scrous oozing. The gangrenous appearance now occupied the entire limb, almost to the knee, but evinced no disposition to extend higher, for about ten days previous to her death. may observe, however, that an isolated gangrenous spot appeared over the patella, and in three days afterwards the thermometer indicated the following temperature :-

Heat of the ward, 68°; Heat of the sound limb, 820; Heat of the gangrened limb, 74°. At this period no pulsation could be distinguished in the femoral artery at the groin.

It is unnecessary to give a minute detail of the daily treatment pursued. It will be sufficient to observe, that it consisted principally of the internal exhibition of the acctate of morphine, with a cautious administration of wine and stimulants, combined with tonics, the extreme debility and unceasing pain being the prominent indications. She sank gradually under her sufferings, which terminated in death on the 22ad of October, nearly one month from the period of her admission into the hospital. The diarrhoea had returned, and continued unchecked for a few days previous to her deccase, notwithstanding the use of the cretaceous mixture, with kino, opium, and other astringents.

Autopsy, ten hours after Death.

Nothing remarkable was discernible either in the thoracic or in the abdominal viscera. In order to examine the large arterial trunks, I had the aorta carefully removed, together with its continuation into the common iliacs, and also the entire of the main arterial trunk of the diseased extremity, with a portion of the internal and external iliacs of the opposite side. On slitting up the aorta, its coats appeared to be healthy in the thoracic region; the internal coat of the abdominal acrta presented a number of whitish spots, of an irregular makes the followings

atheromatous deposition was expensed to the any inflammatory appearance. The acrta at its bifurcation was occupied by a coagutouch than the opposite one. This lividity soon | ln n of fibrine, of a conical shape, three inches in length. The base of the cone was turned from the heart; its colour was a yellowish white, without a trace of red 3louring matter; it was firm in consistence, resisted strong pressure with the finger, and gave to the vessel a solid fleshy feel before it was slit open. It was intimately adherent by its base to the entire circumference of the artery, and could not be removed without tearing the bond of union. The organization of the coagulum was so perfect, as fully to demonstrate that it had existed during life, and had been possessed of vitality. The apex of the coagulum was also adherent to the aorta. Its base, for the extent of more than an inch, blocked up that vessel, and, immediately above its bifurcation, filled the cavity of the aorta so completely as to act as a perfect barrier against the transmission of blood through that portion of the vessel. Coagula of a similar appearance, but not adherent, occupied both of the common and internal iliacs. The external iliac of the right side was healthy, and unoccupied by coagulum. That of the opposite side contained a fibrous plug. The femoral artery of the diseased side was much contracted in its entire course, even to the ham, and was occupied by coarnla of a reddish-brown colour, but of firm consistence. High up in the groin, near Poupart's ligament, the coagulum was intimately adherent to the artery. The popliteal was much contracted, and the posterior tihial was so diminished in size, that it could with difficulty be recognised; it contained no coagulum; the muscles of the gangrened limb were much softened, and were dark in colour. The aorta, and the remainder of the arterial trunk, with the coagula in situ, I have preserved in the museum at Mercer's Hospital.

Remarks .- With regard to the question, Was the congulum of fibrine found in the aorta a post-mortem deposit, or did it exist during life? I have to state, that, independently of any reference to the history or symptoms of the case, I think its existence during life is fully proved by the fact of its organized connection with the artery. It may also be asked, Were the coagula the cause or the effect of the gangrene? Upon this point I shall refer to the following extract from "Andral's Pathological Anaton After speaking of the various wa an artery may become a

occies of obliteration for by congula of brine) has been more requently observed than the fire out no instance of it has as yet been seen in the aorta; it has been repeatedly found in the arteries of the lower extremities, coinciding with the disease known by the name of gangræna senilis, and it is reasous e to conclude that in these cases the abliteration of the arteries is the cause of the gangrene. This much at least is certain, that it is not the effect; for in a patient who lied of gangrene in one foot, and in whom all the arteries of that limb were completely obstructed by solid coagula of fibrine, the commencement of a similar obstruction was found in the arteries of the opposite limb, although not a sign of gangrene was observable in it. It appears to me highly probable that if this individual had lived for some time longer, the arteries of the sound limb would have become more and more obstructed. and that the foot of that side would then have become gangrenous."

The following passage from Dr. Thomson's excellent work on inflammation may not be considered out of place here. In the article "Mortification," he says, "Fabricius Hildanus mentions a case of mortification of the feet and legs which proved fatal to a man in the vigour of life, and of apparently sound constitution, in whom after decease a scirrhous tumour was found surrounding and compressing the inferior cava and norta, just where they are about to divide, to form the iliae vessels, and which by its pressure had prevented the free passage of the blood to and from the lower extremities."

Beclard also was of opinion that the obliteration of the arteries was the cause of the gangreen senilis, as will appear from the following extract from his "Elements of General Anatomy:"—"Contraction and obliteration of the crural trunk and its branches. This is the ordinary cause of the gangrene of the toes, feet, and legs, in old people, the change happening in a part, and at a period, when the arterial twigs themselves, affected by induration, are no longer capable of the rapid augmentation necessary for the establishment of a collateral circulation."

I shall not trespass further on your valuable space than just to observe that I lately witnessed the dissection of another female who died of the same disease, and in whom there were found most extensive ossific deposits in the thoracic and abdominal norta, we well as in the artery of the affected limbs. In this case also the posterior tibial artery of the difficulty of diminished as to be found with diffi-

RYCESS OF

FATTY MATTER IN THE BLOOD. DEFICIENCY OF THE RECTUM.

To the Editor of THE LANCET.

Sia,—I send you two cases of unusual occurrence, the first recommended from the remarkable milky appearance of the blood; the second being a case of imperforate anus, with deficiency of the rectum. By giving them insertion in your valuable journal, you will oblige your obedient servant,

THOS. ROBT. TATHAM, Surgeon. Huddersfield, Nov. 27, 1835.

Case.-April 25th, 1833.-Mr. William Bond, atat. 36, publican, of a florid complexion, rather corpulent, and of a sanguineous temperament. I found him suffering from a severe catching pain in the right hypochondrium, much aggravated upon pressure, on the slightest attempt to take a deep inspiration, and also increased by the recumbent posture. He had headache, the countenance was flushed, and there was a suffused reduces of the eyes, tongue furred, dry in the centre, much thirst, surface hot and dry. Pulse 136, full and hard; urine high-coloured; howels confined. Says he has not been quite well for the last fortnight, having suffered from loss of appetite, disagreeable taste, and "greasy" eructations; did not vomit; complains that his vocation exposes him more to the influence of liquor than is consistent with health.

V. S. ad deliquium animi. Thirty ounces were taken.

- R. Calomel. gr. xij; Pulv. Opii gr. iij. Cons. q. s. Divide in pilulas vj. Capt. 3tiis horis.
- R. Mistur Effervescentiæ, sumend. 3tils horis.

P.m. Pain in the side much relieved. breathes with tolerable ease, can lie down in bed without inconvenience, but cannot take a deep inspiration without pain; skin become moist; pulse 130, softer. The blood as it stands, undisturbed, appears like thick custard; the coagulable lymph on the crassamentum is a quarter of an inch thick, and the serum has precisely the appearance of milk. These peculiarities induced me to submit it to the inspection of Dr. Walker and Dr. Turnbull, physicians, of this town. Dr. Walker visited the patient with me on the following day. Upon drawing off the serum from three teacupfuls of this blood, leaving the crassamentum behind, and mixing with it half its volume of sulphuric ether, it yielded, upon evaporation, upwards of two drachins, in weight, of fatty matter, of the consistence of butter.

sediment in the urine; bowels bave not yet been opened. R. Ol. Ricini zvj. statim sumend, et rep. 6tis horis, si opus sit.

27. Two doses of the oil produced three dark-coloured and offensive evacuations.

May 3. Convalescent. During the last few days more active cathartics were administered, which have restored the healthy appearance of the evacuations.

CASE.—January 16, 1835.—I was sent for by Mrs. Whitworth to examine her male infant, born on the 14th inst., which she had just discovered had an imperforate anus-The infant had been indisposed from its birth, and refuses the breast and all nourishment. It is very restless, almost constantly crying, holds itself stiff, turns blueish, and appears to be threatened with convulsive fits. She attributed these symptoms to uneasiness in its bowels from its not having had an alvine evacuation. The greenish slimy appearance of its urine upon the cloths, led her to make an examination, when she discovered an absence of the natural outlet from the bowels. The raphe, from the scrotum, is continuous through the perineum. There is no vestige of an anus, no doughy feel, nor any sense of fluctuation on making pressure over the parts. Mr. Robinson, surgeon to the Huddersfield Infirmary, accompanied me in the afternoon to see the patient, when we decided upon an operation without further delay. I commenced by making an incision in the line of the raphe a little below the acrotum, and carried it rather beyond what I supposed to be the proper situation of the anus. This incision might be an inch and a half in length. then carefully dissected backwards, to avoid wounding the urethra and bladder, and downwards, towards the sacrum, full one inch from the surface of the perineum, before I reached the gut, which was much distended, the infant forcing very much the whole time. I made a free cut into it, which was followed by a very copious discharge of meconium. I then passed with the greatest ease, and without apparent increase of pain to the infant, my left forefinger into the colon. Oiled lint was placed in the opening. Very little blood was lost in the operation, but blood oozed much during the night. The child, however, continued hearty, and partook freely several times of arrow-root.

February 1st. Doing well. Fed with the spoon; the mother could not get it to suck, and her milk has now disappeared. A little oiled lint, and simple ointment on lint, were used during the first five or six days. Afterwards I made a bougie of tolerable size, and covered it with wax, which is introduced three and four times a-day, allowing it to remain for a quarter of an hour or twenty minutes each time.

10. Up to this day the infant continued municating with

26. Improving; pulse, 126; lateritious to 06 well; it have made water in natural diment in the urine; bowels have not yet quantity, quite olear from feet matter, and passed its stools without much inconvenience. The use of the bougie has been diligently persevered in three and four times a-day; nevertheless the parts have contracted rapidly. Passed per urethram this morning a quantity of fecal matter. Phymosis has come on; the scrotum is slightly or matous; and the perincum is inflamed, swelled, and painful. Bowels rather confined; dejections of a pipe-clay appearance. In consequence of the inflamed state of the parts I desired them to desist from using the bongie for a day or two, and ordered a zinc lotion to be applied to the affected parts, and a dose of castor-oil, and some alterative powders to be taken twice a-day.

13. Much the same; the oil operated freely, takes scarcely any nourishment, very restless; there is now much purulent dis-

charge from the urethra.

15. Takes more nourishment; parts less inflamed; bowels more regular; the bougie is again used, a little bloody discharge follows each introduction.

19. Rests better and takes more food; vet is weaker, and more attenuated; the urethral discharge continues not so severe; the phymosis and wdema of the scrotum have subsided. Dr. Walker and Mr. Robinson called this morning, but suggested nothing that could be of decided relief. The mother, of her own accord, has given it, during the last few days, a little Godfrey's Cordial.

26. Much the same; discharge of fecal matter, per urelhram, continues daily; sero. tum very much relaxed; screams violently at every attempt to make water; the introduction of the bougie causes spasm of the bladder, and a flow of urine,-bloody mucopurulent discharge following its removal.

March 15. Continues to decline; is much more attenuated; the appetite is variable, sometimes very voracious; the artificial opening is more contracted; the other symptoms are as before noted.

20. Dead.

Automy on the 21st; Dr. Walker and Mr. Robinson present.-Body very much emaciated; thoracic viscera healthy. On opening the abdomen, the omentum was found nearly free from fat; the large howels were greatly distended with air; liver much shrunk, small intestines of a shrivelled appearance; stomach and mesentery natural. I detached the scrotum and penis, with the corresponding integuments, from the pubes, carefully divided the symphysis, and separated the bladder from its connection with the inner surface of those bones. Passing a director through the urethra into the bladder, and slitting it open superiorly, I found the qui ing to be a small narrow canal, an inch in length, situated. hind the prostatic pe

tremity of the colonic and gut contained a little blanky muco-pic. ent matter, and cardled feesig it had descended to within if an inch of the surface of the perineum. This portion, judging from the appearances, would soon have been in a highly diseased state.

MODIFIED SMALL-POX

OCCURRING

TWENTY-TWO YEARS AFTER VACCINATION,

Turning on the third day after the appearance of the Eruption.

To the Editor of THE LANCET.

Sir,-1 beg to send you the following case for publication .-

J. S., actat. 51, of short stature, and well formed, possessing general good health, and having scarcely ever known, as he states, "what it is to be ill," was seized with a sharp attack of fever, attended with severe headache, which he attributed to cold. A dose of calonicl, and an aperient, relieved him, but he was unable to quit his bed, on account of debility and giddiness, for ten days, during which period there was occasional remission of the febrile symptoms, which on the sixth day assumed the intermittent form. On the eighth day, two incipient pustules appeared on the hand, suceceded by others on the face and hody. I at first imagined these to be varicella, but the number and character of the pustules on the tenth day were unequivocal. The cruptive fever was severe; about a dozen pustules arrived at maturity; those on the hand progressed regularly, but on the face and some parts of the body they died away before the formation of pus. On the tenth day, those which had maturated became flattened, and were scabbed on the thirteenth. The patient gradually recovered, and was quite well on the fiftcenth day.

On examination of the arm, there appeared two well-defined cleatrices. The vaccination had been perfect, and the patient described it as "a very fine arm." The rise and progress of the pustules were steady and uninterrupted throughout. No lymph was taken from them, and to this fact I am disposed to attribute his preservation from the disease, which, but for this ægis, would, all Prohability, at his age, have terminatatally.

am, Sir, your obedient servant,

T. W. WANSBROUGH.

DOUBTFUL SEX.

CANCER OF THE RECTUM SUCCESSFULLY REMOVED.

To the Editor of THE LANCET.

Sig.—I take the opportunity of a friend proceeding to London, to send you two cases which you may consider of sufficient interest for publication.

I am, Sir, your obedient servent, D. R. RANKIN. Carluke, Lanarkshire, Nov. 15, 1835.

Case 1.—A case of that peculiar conformation which is usually distinguished, however inaccurately, by the term "Hermaphrodite," has lately fallen under my immediate observation, and as it is remarkable in some degree, I shall in the following short description try to bring before the reader as distinct a picture of the case as possible.

The child is about ten months old, healthy in every respect, and well made. The present appearance of the lufant, so far as regards the external parts of generation, is much the same in proportion as it was at birth. At certain times, without close inspection, the parts present all the characteristics of the female; the mons veneris is freely rounded, and the labia majora are of the usual dimensions, in the commissure of which the clitoris is merely seçu. At other times an opposite appearance is presented; the labia disappear, a scrotum hangs loosely down, and, in place of the clitoris, a penis, small in size, is beautifully displayed.

During the first-described state of the parts, on more minute examination, the labia are found to be covered with integument, corrugated, and in other respects like that which forms the scrotum, and to contain, each, a small moveable oval body, like a testicle. There are no nympha; but a fold of integument, reflected from that protuberance which occupies the place of the clitoris, simulates faintly those processes. The body holding the place of the clitoris, has a mucous membrane for its covering, is cylindrical, about three-fourths of an inch long, rather disproportioned in thickness, not unlike, in shape and size, to a large well-formed female nipple, and very much resembles a penis. The glans with its perforation, and the prepuce (short and incapable of covering the glans) with its fremum, are most distinct; but there is no corona glandis, or cervix. Beneath, and at the root of this body, there is a small orifice, which proves to be the proper urethra; and under this, indeed in its proper situation, another opening, the vagina, which, in appearance and depth, is of the normal standard.

In the other state of the parts described.

the middle, giving a pouch to each testicle, and the penis is short.

The anatomical structure of the penis, or clitoris, in this case, it is not easy to detercharacteristic of both. While in the crect state, it can be very easily traced to its root, which seems to be over the symphysis pubis -there being no trace of it in the perineum.

The question, Is it male or female? has a hundred times been asked; a question which, in the meantime, cannot be decided positively. Independently of any other consideration, the presence of testicles, with some, decides the natter; but the minute of the knife, which, guided in this way, was inquirer perhaps will not rest satisfied with brought freely out at the perineum. The such evidence, so long as the functional; powers are questionable. May not there be a womb, and appendages, and overies too? A near approximation to such a formation has been proved eftener than once, and we way. The whole diseased portion was now do not know what may be the result of further investigation.

Case 2.- Mrs. ---, aged 55, of weakly constitution, was first seen by me towards the end of Nov. 1834 She had for nine months endured a great degree of torture, from pain in the rectum; for the last six weeks she had had discharge from the anus, of very offensive matter, and the pain was now so incessant and severe, that life had become a burden. She had been attended. during the period above stated, by the family surgeon, who supposed that it was a hemorrhoidal affection from which his patient suffered, and treated her accordingly. He had even lately "cut away a blind pile," as he called it, namely, a part of the scirrhus.

On examination per vaginam, a flat, indurated, inelastic body was distinguishable on its posterior aspect, and on introducing a finger into the rectum, and passing it on the anterior aspect, an extensive, irregular, tubercular surface was detected. With the aid of the speculum the whole was brought into view, and the nature and extent of the disease at once seen. The disea ed mass, a congeries of tubercles of various dimensions, extended nearly four inches along the anterior of the rectum. It was about two inches broad; the margins were well defined, and the rest of the bowel seemed to possess its integrity. As the only probable means of relieving the immediate sufferings of the patient, and the only hope. however small, of affording permanent relief, or at least of prolonging life, an opera-tion was recommended, Mr. Logan, of Lanark, concurring in the proposal, to which the poor sufferer willingly responded.

On the 29th of Nov., after a renewed and careful examination of the parts, the operation was performed. The recto-vaginal pregnation in the

while the female peculiarities are sufficiently septim was the to inches the at the well marked, the male organs are very fairly perineum, and, as the superior of the well marked, the male organs are very fairly perineum, and, as the superior of the well marked in temporary fully an inch; to the superior of the super o inches thisk at the vagina, posteriorly, were greatly attenuated, and proved, at some particular points, to be involved in the morbid mass. It was there. fore thought vain to endeavour to preserve mine; it is, however, an erectile body,-a it. The patient being placed in a suitable position, the speculum was introduce into the rectum, and so managed that one or the arms ran along the anterfor margin of the diseased intestine on the right, side, which was the line of the first incision. The knife was passed along the arm of the speculum, while the index-finger of the left hand was introduced into the vagina, to receive, at the highest part of the tumour, the point part thus freed on one side, was grasped by an assistant with a long flat forceps, and carried to the right side. The incision on the left side was then made in the same taken hold of by the left hand, and pulled down until the knife easily reached beyond the disease, which was detached by a transverse incision. There was little blood lost, and the cantery was required to be applied only at two points. A sponge, loaded with a weak solution of nitrate of silver, was introduced into the cavity, and the patient put to bed. Setting aside the inconvenience experienced by the involuntary discharge of feces, and the falling down of the worsh, no untoward symptoms ever appeared, and the patient now enjoys comparatively good health.

The diseased portion of the rectum, on inspection, presented all the characteristics of tebercular scirrhus. Ulceration had commenced in three different places, and there was one alcerated cavity large enough to admit a walnut.

EARLY BREEDING IN THE HEIFER.

P.S. I have notes of a few interesting cases, (?) not strictly medical however, which have lately occurred (?) in my neighbourhood. One of an animalcule in the eye of a horse. One of singular monstrosity in the shape of a chicken with four legs and three wings. And a case of precocious impregnation in the cow species. A bull calf of less than three months age, and a quey calf of about two months, copulated, and within nine months the female brought forth her first-born; both mother and offspring being yet alive. Will details of any of these phenomena suit the pages of THE LANCET? If so they shall be forwarded,

. We find the following statement, he Mr. W. A. Cartwright, of Whitchurg the Veterinarian for November ing on the subject

able farmer "A Wilson, residing to kington will, had a cow that calved he will are calf in January, 1834. When about signmenths old, this calf was bulled by a buil calf of the same age, when running out with her, in about nine months after she calved very well, and brought a heifer calf which is now rearing. It is rather small but healthy. The breed of this heifer is of the short-horn."

In the same periodical for December, the Rev. Henry Berry, alluding to the above occurrence, makes the following statement. The subject is interesting to physiologists : -

"I this year lost an improved shorthorned heifer, from the injury experienced in extracting a calf at a period when the dam was only thirteen months old. The bull's access to her at such an early period was of course accidental; but the circumstance of calves seeking the bull at this early age is quite common in my stock, most particularly if the calves be allowed to suck the dam. Strange though the circumstance may seem, I find them more susceptible of impregnation at a very early age than when more matured; and, still more strange, my late but frequent experience has been derived from cases where the calves, unmanageable under these circumstruces, have obtained access to a particularly large bull, whose size would suggest the impossibility of consummation. I think it probable that any calf allowed to suck the dam, would come earlier in season than otherwise, but the improved short-horns are peculiarly characterized by general early maturity, and I should, even without the testimony of experience, be inclined to expect the result under consideration, as well as the other indications of such early maturity.'

THE LANCET.

London, Saturday, December 5, 1835.

THE excitement in the profession on the subject of the medical contracts which are still being made in the new parochial unions, is on the increase. The dissatisfaction is deep and general, and sincerely do we hope that the indignation of the members of the profession will undergo no abatement, until the vite, the abominable, the brutal system which the making of these contracts is il be for ever abolished.

condemn the Poor-Law Commissioners. when those gentlemen had expressly declared to Mr. Houges, M.P. for Kent, and other gentlemen, that the Boards of Guardians should exercise the unrestricted privilege of arranging the conditions of the medical contracts in the new parochial Unions. In offering those exculpatory remarks we relied on the word and promise of the Commissioners, - our reliance was, however, but indifferently founded, if the statements which are contained in the letter of Mr. CELLY, of Aylesbury (inserted at page 387 of this week's LANCET), be supported by a correct apprehension of the circumstances which he has explained. Mr. CEELY does not write anonymously. He is a most respectable and intelligent practitioner, and we place, therefore, the fullest reliance on the details which he has communicated. It would now appear that the charge of interference in arranging the medical contracts between the boards of guardians and medical practitioners, is brought home distinctly and unequivocally to the Commissioners and their agents, and thus the promise which was so unreservedly made to the Kent deputation, has been unfeelingly and unblushingly talsified. It is really impossible to write or to speak on this perverse and cruel exercise of authority, with any degree of moderation or patience. The Commissioners and their agents are resolved, it seems, on reducing the amount of the poor's rates. "No matter what may be "the consequence to the poor,-no matter "what sufferings may be inflicted,-no " matter what lives may be lost,-THE POOR-"RATES MUST AND SHALL BE REDUCED." Thus would speak the Poor-Law Commissioners. But a declaration of a very different character will be heard from the mass of the people of this country. The conduct of the Commissioners and their agents relative to the contracts, is bringing the Ministers of the Crown into disrepute and of this Journal we odium everywhere throughout the rural t it was unjust to districts, and, Heaven knows, a reforming 2 C

ministry stand in need of no such depress- | will ing auxiliaries in those quarters.

wards of fifteen thousand medical practi- country committed that they should be detioners, whose occupations necessarily lead prived of the services of respectable resithem into all ranks of society, and whose dent practitioners, and be turned over to a learning, usefulness, and integrity of cha- set of low-minded mercenary adventuates? racter, render them the objects of universal Are the meritorious labouring men of Engesteem and respect. Leaving out of con- land to share a worse fate, with respect to sideration, therefore, the protection of the poor, which ought to be the first subject of Let us state one fact in order to exhibit the consideration, can any executive govern-scandalous measure of injustice with which to treat with disrespect, contumely, and insult, such a body as is constituted by the criminals, when patronage is to be bestowed. Commons, he spoke in a tone of the most fervent earnestness, in deprecating any arrangement with medical practitioners, conduct, therefore, of the Poor-Law Commissioners and their assistants must be not, under the specious pretext of providing more, -if he be sick, if he be bed-ridde the poor with competent practitioners from for a whole year, and, further, it a distance, send amongst the wretched and able mud-hovel he ten ; destitute sufferers, a set of VAMPIRES, who of the mercilens co

cobtain a dispraceful dy consens livelihood, by a profuse sacrifica homan There are, in England and Wales, up-life. What offences have the poor of this medical aid, than the criminals in our jails? ment be justified in suffering their officers our poor are treated, and the opposite course which can be pursued in the case even of members of the medical profession? But When the "estimates" were hefore the we are firmly convinced that neither the House of Commons in the last session of Prime Minister nor the Secretary of State Parliament, votes of money were demanded for the Home Department has sanctioned by Ministers, for the supply of medical atany one of the disparaging acts of the Poor- tendance on the prisoners who were con-Law Commissioners relative to the medical fined in the Penitentiary of Milbank. The contracts. When Lord John Russell was number of criminals was under 600, -all, addressed on the subject in the House of observe, at hand, -confined within the walls of a single establishment,-and every prisoner necessarily rendered subscrvient to the orders of the medical attendant. The which could have the effect of derogating Penitentiary is not an hospital. There were from the interests of those gentlemen, or of not five hundred and odd sick persons placed withholding from the poor any essential there, but six hundred healthy persons, medical aid in the hour of sickness. The simply exposed to the casualties of disease. And what sum was voted by the House as the salary of the resident surgeon? Why, brought under the consideration of the three hundred pounds, for one year! And executive Government, and of Parliament, what for the visiting surgeon? Three hunand we will soon see whether the evil, great dred pounds also! These sums, be it obas it is, cannot be removed by an efficient served, were exclusive of the charge for and permanent remedy. The course of con- medicines. Now observe. Medical aid is duct which the Assistant-Commissioners provided for criminals, in a state of health, are pursuing, is calculated to drive the peo- at a charge, per head, of upwards of one ple into a state of fury, of madness. If it pound per annum, while the poor labourers be the object of those hired functionaries in the Unions are provided with the occato destroy the poor sufferers, let them have sional presence of a medical adventurer, at the honesty, the boldness, the courage, to a charge varying from two shillings to three make the acknowledgment; but let them shillings and sixpence per annum, and no

Good and! We we find atrocities of this description commonly and unhesitatingly perpetrated. It is impossible, utterly impossible, that Ministers can be guilty either if the cruelty or the folly of giving their article to such a brutal system. On this point, however, it has become necessary that the most accurate information should be at once obtained.

THE circumstances connected with the illing up of the vacancy caused by the resignation of Mr. KIRBY in the Dublin School, vill be stated in the next LANCET in the communication of a correspondent. save not space on the present occasion, to ollow the intriguers through the windings of their crooked and despicable policy, our bject being merely to place before the world a specimen of the corruption which orms the staple of a medical corporation. The details, of proceedings of this kind, are vorse than imagination can in general coneive them to be. Let the reader assume my ideal standard of turpitude, and he will and it, on examination, to fall far short of he reality of the present proceedings, into vhich not one useful or equitable object eners. As to the qualifications of the candilates, or the principle of conferring the ofice on the most deserving competitor, the parties do not even pretend to think, much ess to speak. That would be "radicalism" and "revolution." When the concours was proposed some time ago in this Institution, very objection was made to its introducion, on the grounds of its complexity, and he difficulty of carrying it into execution. 'Such a plan of disposing of professorships," aid the junto, " was perfectly impossible." But what mode of effecting such an object an Aual in tumult and intricacy, the plan ad in the present instance, where we dements of discord, and the ocesses, along with the

Mombers of the College, and the perpetualatrocities of this tion of the grossest injustice to the candidd unhesitatingly dates?

> THE professor of the "Institutes of Medicine" in the School of Physic in Ireland has been practically illustrating of late the moral of the "little harper in the great theatre." Like the puny musician who mistook the acclamations of his village admirers for the voice of fame, and fancied that the tones of his diminutive lyre would be equally successful in securing the applause of the world upon a larger stage, he has been exhibiting himself, under the impression, no doubt, that the public would repeat the parasitic approbation of the coterie of medical conservatives in the Irish metropolis, and he seems to have had no friend to admonish him of the imprudence of the experiment - no Moliere's old woman to refrain from laughter during the perusal of his vagaries. The course he has adopted is, perhaps, the best calculated to undeceive his self-love, and bring his followers to their senses. It is possible that with his address he might retain their allegiance a little longer-might continue their " consulting physician" and " medico-political advocate" some few months more-were it not for his furnishing them so abundantly with the means of detection.

Let us see how the account stands between these trusty adherents and their disinterested leader. The compact was this,-for it would be idle not to presume a reciprocity of advantages between these honourable individuals -that their bigotry should be defended, and their monopoly secured, against the ravages of Reform. Upon one side were expected the brilliant efforts of an accomplished pleader, and the imposing authority of a man of science; on the other the patronage of pupils and of patients, and an annual subscription for "the Journal." what have these expectations eventuated? One of the Journals, selected as the mirror for reflecting abroad the beauties of medical science in Ircland, has died a natural death: the other has been preserved from a similar fate by a timely subscription during the recent summer. As refutations of the described condition of medical affairs in Iresel contests on the land, we have had oracular contradictions;

and in science, the gleanings of continental authors put forward as productions of Irish growth. In physiology we have had fine specimens of philosophy run mad,—and in therapeutics, pleasant juleps and agreeable mixtures. In medical literature, the labours of a Grub-Street compiler,—and in materia medica, the commentaries of a confectioner!

By these Herculean exploits were the patronage, the tuition, and the practice, of the medical profession in Dublin, to be secured for ever. Considering the condition of Ireland, and the precedents in other departments, it is not wonderful that the mistake of imitating those examples was made, although, at that very moment, the political monopolies which they sought to rival in medicine were universally execrated by the Irish people, and virtually abandoned by cabinets of all shades and colours, from the cabinet of Wellington to that of Mel-BOURNE! Men with far less sagacity ought to have seen that the system of exclusion which was not maintainable in the church, in the corporations, or at the bar, could not be sustained in the medical profession. It was not prudence but sheer stupldity to stand between the ruin and its fall; but from the quarter to which the party have all along addressed themselves, they seemed to think that if they could meet the statements and arguments of THE LANCET, their case was safe. Yet even had this journal latterly been silent, the impetus it had already given to reform could not have been retarded much longer. Public opinion had become too strong an enemy for the junto to cope with. Were the profession in Ireland likely to be satisfied with less than was to be conceded to the profession in England and Scotland? Did they imagine, for instance, that the fact that not a single individual belonging to the faith professed by the bulk of the Irish nation, fills (as we believe) the office of surgeon or physician to any Irish County Infirmary, would not be considered as a gross anomaly and a scandalous grievance? Was it to be supposed that the people of Ireland would be content with an University, the by-laws of which declare that no Catholic shall ever hold in it the office of Professor? As well, indeed, might Dr. GRAVES and his party expect that the sturdy followers of Calvin in Scotland would allow the episcopalians in that died at each distin

country to how the possession of all their universities the schoolst And yet such is the proposition of the model monopolists of Dublin!

But sooner or later will the inhabitants of Ireland either force open the existing institutions, or possess institutions of their own. They are intent upon this course. eir enemies force them to adopt it. We are perfectly aware of the kind of use that will he temporarily made of this announcement; nevertheless, the event cannot be retarded, however great may be the abuse cast upon THE LANCET by the monopolists. The question is not now, "Shall there he reform?" but "How far shall it be carried?" The spokesman, Dr. GRAVES, suspects this, or he would not have deviated from the old usage of treating public opinion with affected indifference, and admitted the necessity of reform, in his late "introductory" lecture at the Meath Hospital. The extent of reform will be discussed in the next harangue at that place.

In our present Number will be found the first part of an extremely interesting paper by Mr. Edmonds, of Regent-square, on the influence which age n the population, and locality as regards divisions of the country, exercise over the mortality of various portions of the English population. The new and valuable materials - of unexampled varicty and extent-on which Mr. EDMONDS has exercised his abilities and his great industry, - are but little, if at all, known to the public; and the devotion of so much time and attention to them as his papers evince, renders the community, for whose advantage they are designed, greatly his debtors. The chief of those materials convists of a Parliamentary return of the ages of nearly 4 millions (3,938,496) of deceased persons, and of more than 10 millions (10,530,671) of persons living, also distributed according to the terms of their age. These numbers have been divided into 100 portions, the sexes of the individuals enumerated being distinguished in each county in which the individuals are stated to reside; and also in each of six large towns. The "law of the mortality," or a careful disc the number of these is

number of persons w naterials.

In giving a place in our columns to the consunication of Mr. Edmonds, we are ininenced by the impression, long ago enterained, that the subject is one of peculiar mportance to the members of the medical profession. It can hardly fail to excite, inleed, a high degree of interest, local and general, amongst the people of this country; out to the medical community, especially, t affords an abundance of new and rich natter for reflection. The results themselves appear to us to be of high intrinsic value; but he exhibition of all the steps of the simple rocess by which they have been derived, nay, perhaps, be considered of great pernancnt use as indications to the inexpeienced in these matters, of the course thich should be pursued in the invesigation of the same, or of other similar maerials. In medical statistics attention has ither to been confined chiefly to the retive mortality resulting from different disases, and to the number of deaths and reoveries which have occurred among a given umber of persons attacked by disease. The uration of the attacks, and the ages of the atients, are indeed now deservedly becoming bjects of great importance. But observations f this latter nature can supply no measure f the health of a population, so long as we ontinue ignorant of the number and ages f the persons living from whom the disused are taken. In order to obtain an ccurate measure of health, it is essential at the number and the ages both of the ving and the dying should be observed. nd that the number who are sick at each re should be distinguished.

It may serve, perhaps, to increase the tention of our professional brethren to the ocuments which we publish, when they e informed that very great secrecy is prerved on the facts which they develop, by ie remainder of the very few persons bedes Mr. EDMONDS, who possess any real howledge on the subject.

nace for the insertion of

cach lived to the of London. The ministerial plan for foundthe information which has ing a general university in the metropolis, been laberiously sought by Mr. Ednonds, is distinguished in many respects for its and ingeniously obtained by him from these liberality; but the scheme will never receive our unqualified approval, unless the charter shall provide-after the institution is set in motion-for electing the future examiners by concours; nor, unless every candidate for the honours of the University shall be admitted to examination, simply on his furnishing proof of his having ever sustained a character of unimpeachable moral rectitude. The scheme in its present form will only add new strength and vigour to the odious, the infamous, certificate system. The letter, signed "A STUDENT," in the present Number of THE LANCET (page 388) relating to this subject, merits general attention.

> THE facts relating to the late disinterment of a body at Moulton, and the consequences resulting from the discovery of the proceeding, are not unknown to us. We only hope, for the credit of the profession, that any one of its members who may be at present involved in the charge connected with the disgraceful transaction, possesses the means of freeing himself with honour from the implication. The affair is undergoing legal investigation, and we shall therefore abstain from saving anything farther on the subject at present.

THE LATE DR. HAMILTON.

(From an Edinburch Correspondent.)

DR. HAMILTON, the author of the valuable work on the treatment of diseases by purgatives, died on the 27th of October last, having arrived at the eighty-eighth year of his age, and enjoyed, during that long period of life, an uninterrupted course of good health.

There were many features in the life and character of this able physician which are worthy of notice. It may justly be said of him, that he constructed one of the best works on practical medicine which appeared during his day; and he was, at the same time, one of the best practitioners of the Scottish metropolis.

JAMES HAMILTON was the son of the Professor of Natural Philosophy of the Univerpsedings which took sity of Edinburgh. Having had an excelat the University tent preliminary education, he commenced the study of medicine,- the school of Edinburgh having at that time acquired its highest reputation, its list of professors have looked chiefly to the list being adorned with the names of MONRO, CULLEN, BLACK, and GREGORY.

Finding an unconquerable difficulty in even witnessing operations of surgery, Dr. HAMILTON commenced practice as a physician; and although he always had the reputation of possessing good sense and a sound judgment, he was very little enployed in private practice; and the greater portion of his time was devoted to the duties of the Royal Infirmary of the city. It was not until he had passed the fiftieth year of his age that he enjoyed any professional reputation. He had never devoted himself zealously to any pursuit connected with the science of his profession; and he was even defective in its rudiments, having, like his contemporary, the second GREGORY, no knowledge of practical anatomy; and possessing, consequently, no accurate knowledge of pathology.

At about this period of his life he came forward with his work on "Purgatives;" and never was any literary production more cordially received by the profession. The views which he inculcated therein were at once adopted by a great proportion of British practitioners. It passed through one edition after another, at once establishing the fame of the author as that of a first-rate

practical physician.

At the same time that HAMILTON was directing the attention of the medical world to the administration of remedial measures in the treatment of fevers, and ascribing many diseases of the nervous system to the alimentary canal, ABERNETHY was employed in pointing out a variety of local ailments, all of which were symptomatic of a derangement of some portion of the digestive apparatus, and to these also ABERNETHY directed all his therapeutic means. Each observer was employed in exploring the same country, but they travelled in different roads. Both observers agreed on all practical points; they both agreed in the fact that almost every disease is modified by, if not actually originating in, a deranged state of the digestive canal; and whether it be the stomach itself, the liver, or the large intes-tines, it is those organs to which we must direct our chief remedics in all the diseases of the human body. In confirmation of this important truth, we have only to look at the habits of mankind in civilized life. The irregularity of their meals, and the multitudineus variety of their food, con-trived purely to gratify sensual desires, must constantly disturb the functions of the stomach, while the moral excitement to which mankind is exposed, must, in like manner, whatakes in the choice of constantly derange the operations of the lives as often proposed the liver. It was to this portion of the all-inctions of "seniors mentary canel that Abernstay directed the doors, some symmetry

particular attention to all his michological investigations, while HAMLE in Appears to the last a lestine have looked chiefly to the later injecting. To the congestion and accumulation of fecal matter in the colon, he attributed the chief affections of the nervous system, particularly chorea, but he considered that a man num-ber of symptoms of other diseases, originates in the condition of the alimentary Lunal. Both practitioners established their views by a reference to an immense body of facts. and their joint labours now form the groundwork of the practice of the ablest medical

men in this country.

Much has been told, and truly told, of the absurdities into which these champions of the stomach occasionally fell, from the extravagant bias which their minds took on the subject, its diseases and remedies. To such an extent did Dr. HAMILTON CATTY some of his views, and so eager was he to inculcate the importance of examining the evacuated matters on all occasions, that in visiting his patients in the Royal Infirmary, he was in the habit of looking at the cloaca in every case. An old and waggish nurse who was employed in the Institution at one period, had no difficulty in providing an "evacuation" for the doctor's critical inspection, numerous as were the demands on her faculties of distinctiveness and arrangement. It was at once indeed a saving of trouble and a source of amusement to her to confuse the stools of the different patients, and then to present them to his notice indiscriminately. These deceptions, however, converted laughable errors into a useful conviction, on the minds of the numerous students who attended the Doctor's visits, that little was to be learned from the mere external characters of the evacuations from the alimentary canal.

As a private individual, Dr. Hamilton was generally considered as a very primitive character. He was a perfectly upright and just man, but his generosity of disposition was not very conspicuous towards those who chanced to present claims on his benevolence. Though unmarried, he had the reputation of possessing a progeny. He was rather affected in his dress, continuing to wear a cocked-hat forty years after that form of heaver had been given up by every hody except a few clergymen. He would not wear gloves even in the coldest days of which our northern climate can boast, and he always slept with the window of his room open. In personal appearance he was a little pleasant-looking body, and he generally contrived by his manner to make friends. His house being adjacent to that of Dr. HANGLTON junior, our well-known accoucheur, many amusing anecdotes are told of ladies miles mistakes in the choice of thek

calling of each, in order that the victims of "Cupid" adapt not undergo an unmerited purgetting by accidentally calling at the ach, in order that the victims of wrong house.

INTERCEPTED LETTER.

"DEAR SIR HENRY,-I always feel it to he an honour to receive a letter from you, and am ever proud to fulfil your commands. Your letter, most parts of which I read at a College meeting, was most gratifying. I am every day more convinced that you are not even yourself as well aware of your public as you are of your private professional value. We all look up to you, justly, as the chief pillar of our venerable institution; and we know that when you fall so must Pall Mall East. 1 rejoice in the amendment of your health and spirits, which at the last College meeting you attended we all observed had faded a good deal. Wiston Hall is a delightful spot, and I hope you will remain there until the close of November, in order that both your mind and body may be recruited. My solicitude to see you once more amongst us, prompts me to take the liberty of cautioning you not to make too free with your constitution, and expose yourself too much to the endearments of the fascinating circle in which you move, and have been so fondly caressed. I cannot help recalling to your memory the sage advice which you gave some years ago to the gallant Duke of Wel-LINGTON, and as you are much more advanced in years, the same precept may now be to you even more applicable. I am contident that by tender nursing and great command over your passions, your mind and body may yet last a few years. The aged are not less apt to become the victims of female society than youth, and if you at your time of life were to take to yourself a young wife, we should soon lose your valuable services. It is my high consideration of those services that prompts me to write to you on this practice. Nobody but a blockhead would delicate subject.

"I don't know that I have much news to tell you. All of us will join you heartily in keeping things at the College in statu quo, and we are every one confident that your ingenious and comprehensive mind will contrive a tub for the whole, and that you will easily manage to amuse these pettyfogging licentiates with another reform phantom. You have no one to fear, as all of us will be glad to keep you in the president's chair. There is in fact no other man in the profeson high enough in rank and science to fill the same dignity and credit. The think are paralysed. MATON,

of the favourite suppressed the facts respecting the indecorous part of his life. A married Fellow, with legitimate offspring, might have been something; but the least public suspicion of immoral habits, unfits any one to be an occupant of the President's chair. Such a person could never have overthrown a man with your high moral feelings. WARREN, whom you reasonably considered as an opponent, will soon leave this wicked world, for he is very very ill; so instead of fearing him, you may pray for him.

"I have done all I could to obtain information about the schools. The different lecture-rooms have been open some time, and I wish my statements respecting several of them could be more gratifying. But I must not deceive you. The medical pupils of the London University have increased prodigiously. Last year there were 300, but this year the number is not less than 500. The other schools have suffered a proportionate diminution, some of them having been hit most severely. St. Bartholomew's, notwithstanding all STANLEY's efforts, are 83 minus.

At the Borough hospitals they are making a convulsive struggle, but all the palm oil which King HARRISON can supply, does not seem to make the rusty wheels of Guy's go quicker. At St. Thomas's, however, the classes are a shade better. The reason is, I understand, that they are more liberal in their conduct to strangers. At Gny's their demeanour to visitors is quite ungentlemanly, and contrary to every rule observed at the other and more liberal recognised hospitals. They are machinating a quarterly journal of Reports. Such a thing is already advertised at St. Thomas's. But they are a dozen years too late. Had they been wide awake in 1823, they might have prevented the inconvenience of criticism with report-But they say that the unfortunate Gazette is rend by so few that it does not answer the purpose of the hospital surgeons. These *pure* journals, however, must fail, as of course they will only contain successful cases, and will give none of the bungling publish an unsuccessful case.

"The Westminster School is as low as low can be. I conversed with a gentleman who went to hear one of the new-fashioned clinicals, and who, after waiting for three quarters of an hour, took his departure, because no other soul but the lecturer attended. GUTHERE is sliding down rather fast, though he was never far up in the estimation of the competent judges. You will find a melancholy scene described in THE LANCET. All true! The College have kept the Charing Cross concern out of competition with their own hospitals, by refusing to recognise the k are paralysed. Maron, practice. Our St. George's friends have met tainly aspired, but he is with the fate which you foresaw. The wild. Had he been a 7000% sunk in brick and mortar, will never we should not have again be converted into currency. The two

opposition. LANE, who is as sharp as a needle, has certainly got the best shop, having spent upwards of 1500l. in putting the original school in order. The Middlesex must be considered as a failure. This I regret only on your nephew's account, for Sir Charles is a bitter enemy of things as they are, though, loud as he talks out of the College, we never hear of any of his efforts in doors to help the reformers. The University hospital has kidnapped every popil in that quarter. Bythe rage here. Have you ever heard of it?

"I saw Turren last night. He appeared low, and said the trade was dull, that he was looking out for patients, and that the old families who used to permit all their domestics to include in the draught system at the master's expense, now oblige them to go to dispensaries, or have their own doctors, which makes a serious difference in the Christmas bills of all the top-apothecaries. He says that no one now ever wants a pure physician, and that none of his patients will stand a regular attendance any longer. We are all fully sensible of the complete change which has taken place in the guinea trade, and every day see the necessity more and more of becoming, in reality, general

practitioners. "I have sent you per coach WARDROP's book on Blood-tetting, which was published yesterday. I think it will please you. It is full of practical information, and contains what are to me many views which are quite original; but I should like to hear your opinion of the work. Favour me also by saving what number of copies I should order for our library, as it will be much called for, for it is a work not for a cursory perusal, but for attentive study and calm deliberation. There is one point in which you may obtain some useful information from it. I allude to the quantity of blood to be taken. I remember a lady, who was present at one of your visits, telling me of the happy effects produced by your nice discrimination of the requisite quantity to be removed in the case of the old Dowager Duchess of R**** D. She said that after repeated most accurate examinations of the pulse, and of the alvine and urinary discharges. a la Pront, you prescribed the loss of four onnees of blood by cupping, and then departed; but on returning to your noble patient in two hours, and having first ascertained that the cupper had not arrived, you then, with your customary tact, expressed an unusual interest in the case, saying 'that your anxiety. was more intense than it had ever been for any patient before,' and that 'after having contemplated, reviewed, and turned over again and again in your mind every particular of was allowed her. The

contending parties have about shared equally ther condition, yet and come to the important to the pupils, each having from twenty three and determination that the quantity of blood to be removed about be only the concerning the provided and give up the sad a saft. I shall never forget the favours opposition. Lanz, who is as sharp as a needle, able impression which your conduct on that occasion made on all concerned; and for years after, the noble family could never hoar your name mentioned without a tear of gratitude rolling dan their cheeks.

"I am glad you are riding a quiet pony. What a frightful escape little BRODIE had in the Isle of Wight the other day! I trust you will have the kindness to let me know about the time that you will come to town, the-by a new medicine, called creosote, is all and say if I can do you any little kindness at Kensington. Do you think there will be a chance of getting up some meetings at the College this season? There are many difficulties which you alone can surmount, if surmountable. I remain, dear Sir Henry, ever your very humble and obliged servant, " W. Mc. M.

"Half-moon Street, Oct. 1835."

LONDON MEDICAL SOCIETY.

Monday, Nov. 30, 1835.

Dr. Whiting, President.

TREATMENT AND EFFECTS OF FRACTURES.

MR. BRYANT placed on the table a speci men of fracture of the femur, of which he gave the following history: A female, aged sixty-seven years, much addicted to drinking, occasioning considerable feebleness of constitution, was knocked down by a boy, when the left trochanter forcibly struck against a curb-stone. She was unable to rise, or bear the least weight on the limb, She was conveyed home and put to bed, and simply kept quiet. On the 27th of October, three days after the accident, she was brought to the infirmary, when the injured limb was found to be two inches shorter than the other. The foot was everted, and on rotating the limb, distinct crepitus could be heard and felt at the upper part of the thighhone. The woman was placed on a fracture bed, and the limb on a double-inclined plane, with splints and bandages to maintain the broken parts in apposition; and thus placed she appeared easy. On the following day she became extremely restless, pulled off the bandages and apparatus, and obstinately refused to have them re-adjusted. He (Mr. B.) then placed the limb on its outer sile, with the knee bent on a pillow, insisting on perfect rest being kept. She remained and comfortable, but became eva feeble, although a supply which she had been a h

boulse rapid and feeble and the tongue dry referable to the injury, but to the shock and brown. The symptoms continued inwhen she died. On examination, a fracture was found through the trochanter; the neck of the femuratas driven into the cancellated structure with the trochanter minor was broken off. The fracture was external to the apsular ligament, but no attempt at union had occurred. Cases, however, of fracture of this description were described by Sir Astley Cooper, where union did follow. His (Mr. Bryant's) object in bringing this case before the Society was to engage its attention on the treatment of such injuries, which he thought was a very desirable object, especially at the present time, as an excellent paper had been lately published in THE LANCET, by a Mr. Radley, who had advanced, very ably and strongly, the treatment of fractures without splints. The plan recommended by Mr. Radley appeared to have been so successful with Mr. R., that it could not be otherwise than worthy the attention of every medical society. Two other specimens of fracture, on the table, were taken, the one from an old man aged sixty years, and the other from a woman aged sixty-three, the injuries arising, no doubt, from the extreme fragility of the bones at their advanced ages; and he (Mr. B.) was very sceptical whether the practice of confining the patients on the back, with the limb extended, was a good one. In fact he was led to consider that great advantages would result from the surgical treatment recommended by Mr. Radley. He Mr. Bryant; did not consider that any benefit would have ensued in the present case if mechanical contrivances had been adopted; and in such cases he regarded the position on the side, with the knee bent, resting on a pillow, the most likely to answer the object of the surgeon. The Society's time, he believed, would not be ill-spent in giving this important subject an attentive consideration. In the case of the female first mentioned to-night, he believed that the accident had but little to do with her death; for but very slight inconvenience arose from the fracture. He, perhaps; might account for the fatal event correctly, by asserting it to be the woman's having become habituated to the use of ardent spirits, which having been in the first instance withdrawn, low fever ensued, which, in its turn, by degrees, occasioned the feebleness under which she sank.

Mr. Jones was persuaded that patients having received severe injuries, died, in innumerable instances, from a peculiar kind slow fever that succeeded, without disstructural change. Irritation,

which the whole nervous system had susfrined. He had seen many persons die from falls which had produced no fractures, in the course of a very few days.

Mr. DENDY pronounced Mr. Radley's plan to be no plan at all, for it permitted the patients to do as they pleased, when, if there were any disposition to displacement of the disunited parts, the treatment without splints would not succeed. In Mr. Bryant's case little could be done, but he (Mr. D) would have added a pelvic strap, to keep the pelvis fixed.

Mr. CLIFTON considered the principal source of irritation in very old people, to depend on the confinement and restraint to which they were subjected after the re-

ceipt of an injury.

Mr. PILCHER attributed the development of the irritation, rather to the confinement than to the abstraction of the stimulants, the former leading to an interruption of the functions of the body, and finally to a disorganization of the viscera.

Dr. JOHNSON maintained that the irritation or mischief resulted from the shock which the constitution had received.

An animated discourse ensued, terminating, however, in each member regarding his own theory as most feasible, in accounting for the phenomena occasioning death in such cases, and the Society soon afterwards adjourned.

OUR REPORTER remarks on the note of Mr. Hooper in the last LANCET, "that he did not anywhere state in his report, that Mr. 11. had said that, 'the exostosis on the tibia of the patient well illustrated the proposition laid down by Mr. Abernethy;' but, rather, what Mr. H. himself states in his note (page 349), viz., that cancer will invade every structure of the body. Although the word exostosis was perfectly separate from the sentence, still it had reference to it; for, as stated in the report, not only soft parts were destroyed by cancer, but bony parts also."

WESTMINSTER MEDICAL SOCIETY.

Saturday, Nov. 28, 1835.

Mr. RICHARD QUAIN in the Chair.

DEATH FROM TAKING MORISON'S PILLS.

Dr. Johnson, in answer to a call from Dr. Granville, detailed the post-mortem appearances of Mrs. Sarah Porter, aged 39 years, who died from effects caused by taking Morison's pills. The particulars of the das a frequent cause of care were given in our report from the London Medical Society, Nov. 33, the day on which she died. The abdonen was rather tumid and distended; peritoneum healthy; sions of the mucous coat; no changes in the duodenum; jejunum and ileum twisted in different parts and with the other, and the to attend an old patient, who, he was con-morbid parts had summed the colour of dark vinced, had also met with his death from the makegany, with distinct demarcations of healthy surfaces; the vessels were injected, and from their capillary extremities blood was extravarated; there were no traces of ulceration, the mucous surface being simply abraded. The parietes of the heart were rather thicker than usual, probably the commencement of an hypertrophied condition. The bloodvessels of the brain were congested throughout, but there were no other morbid changes affecting the substance of that organ. In answer to a question whether the pills had ceased to produce any action some time prior to death, Dr. Johnson said that the medical gentleman in attendance, and the friends of the deceased, had informed him, that ten days prior to her death, she was recommended to give to one of her chil-dren, who was troubled with palpitation of the heart, some of "Morison's Pills;" she complied, but the child got worse. Presently the mother had pain in the head, and she also took them, in doses such as we have before described, producing, shortly after, distressing vomiting and violent purging; and her adviser remarked, that the more actively they operated, the greater number of pills it was necessary to take! An increase in the violence of the symptoms necessarily followed. The friends finding her becoming rapidly worse, sent for Mr. B-, a medical practitioner, who found her comatose, in which state she remained up to the period of her death, four days after commencing to take the pills. The last day or two prior to the fatal event, the bowels had ceased to act, and at the post-morten examination they were simply distended with air. He (Dr. J.) came to the conclusion that death was occasioned by the pills, from the fact that some portions of the tube were highly diseased, whilst other portions were perfectly healthy; and where the lodgement of the irritating substances had taken place, there the changes were evident, and the contractions appeared as if tied with a piece of silk, while there no morbid achesions had supervened; these contractions, when found in the healthy portions of the canal, were a positive evidence of their having been produced by the direct application of an irritating substance. But he did not wish it to be understood that he believed that other powerful pills, taken in the same enormous quantities, would not have occasioned the same result. (The virtues of this quack medicine, however, are said to reside in large doses.) The affection of the head was attributed to the large doses of Ext. Conii,*

stomach inflamed, presenting slight abra- which the pills, be malysis, were found to contain.

Mr. VERRAL said he had bear goqueste same cause; and in whom the pills and other aperients, towards the close, comed. to pro-duce any action. After death an immense mass of the pills and of oil was Ind wedged in the intestinal canal, in so putrid a state, and emitting so powerful an offluvium, that the like he never before encountered.

MEDICAL MAGNETISM.

Dr. Jounson, in a brief address, re-introduced this subject, but it occupied attention only for a short time, the conversation consisting of a few questions that were put to Dr. Schmidt. The discussion of the previous night, Dr. Johnson said, proved to the Society that medical men were not the only class of philosophers who differed. As much variance of opinion prevailed to-night as on the last evening of discussion.

Dr. RITCHIE denied that the magnet, by itself, could produce any therapeutic effects. Dr. SCHMIDT maintained that it could, if the poles were placed according to his arrangement.

Dr. RITCHIE thought it quite a joke that Dr. Schmidt should know how to manufacture magnets more powerfully, and place

them more remedially, than other persons. Dr. Errs replied, that a gentleman had offered to Messrs. Watkins and Hill, of Charing Cross, 100 guineas if they would produce magnets having the like power* They tried, but at last were compelled to acknowledge their incompetency; and he would now propose that Dr. Ritchic and Dr. Schmidt should each take a certain number of pieces of iron, and try who could produce the most powerful magnets.

Dr. Schmidt offered any medical gentleman who doubted his competency to perform what he had described, or who believed that the magnet could not produce physiological effects on the human body, to bring to his (Dr. S.'s) residence, any poor and sick patients on whom magnetism might be tried, the visitor judging for himself of the results, for he had no secrets to conceal. He had abstained from quoting cases cured with the magnet within the last six years. He would, however, briefly state that he knew a lady, aged 22 years, afflicted with amaurosis for several years, and who, during the last eighteen months, was completely blind,

of the lagredients that give to his pills their powerful drastic speriout quality), as it best pleases his fame when preparing the means of deception, for analyses turnish the like product. we take this opportunity. Schmidt withholds

the was soon by several continent physicians, to the Kent deputation:—"That the guarithmut basefut, but in whom the magnet dians of the poor of the respective parishes roduced as speedy and perfect cure. It should not be prevented entering into as ould avail nothing to dotail cases within here walks unless authenticated by the resençe at the patients themselves. Many smooths there certainly were in the pharecopois, but the profession, nevertheless, not overstocked with remedies.

Mr. HALE THOMPSON said he was authoized to offer to Dr. Schmidt the use of the)phthalmic Institution, where he might sehought advisable, and in order that the ragnet might have a fair trial, the sole ianagement of the selected cases should be ntrusted to his care, and he (Mr. T.) would ive to the Society an impartial statement f the results.

The offer was accepted, but not so willngly, apparently, as to prevent Mr. King rom believing that a reluctance existed on he part of Dr. Schmidt so to test the effiacy of the magnet. Mr. King considered hat more effect would be derived from elec-

lectricity in the treatment of diseases, and. forcover, he had not so great a control i ver the electric as the magnetic influence.

Dr. Jourson advised Dr. Schmidt to acdish a cure when the cause arose from oranic changes .- On the whole, the Society cemed to form a more favourable opinion of nagnetism this evening, the interest in the ubject being heightened when it was anjounced that Dr. Faraday had purchased once of Dr. Schmidt's magnets (which Dr. i considered as a proof that his magnets vere very superior) and examined his exeriments, remarking that his views were iew, on some points, and no doubt would hat he should more fully investigate the abject. The adjournment of the Society hen took place.

MEDICAL CONTRACTS IN THE NEW UNIONS.

LETTER FROM MR. CEELY OF AYLESBURY,

, To the Editor of THE LANCET.

we never been among the numhave derived the least ged any hope, from the r-Law Commissioners

should not be prevented entering into as many contracts with medical men as they pleased, because, in the first place, in the rules and regulations originally issued boards of guardians by the commissiones a clause exists, relating to medical relief permissive of such authority,-a clause which, in an official communication on the subject, dated June 20th last (now before me), their secretary states, " he is instructed to declare, empowers guardians to exercise an entire discretion with regard to the medical appointments." In the second place, experience has taught me to entertain no very exalted opinion of the discretion of such bodies in general on such a subject. In the third place, I am unwilling to respect the declarations, and unable to appreciate the authority, of a central triumvirate which, though incessantly disclaiming all interference in the medical arrangements, and for ever alluding to the grant of these discretionary powers, at the same time permits ricity, though whether the magnetic fluid most of its itinerant assistants to be actively iffered from the electric he was not aware, and relentlessly engaged in prejudicing, in-Dr. Schmidt said he had found injurious sulting, and degrading the medical profesesults to arise from the application of sion, often prompting guardians to the execution, and always supporting them in the infliction, of the most flagrant injustice on numbers of its worthiest members.

For these reasons, also, I could not parept the offer to make experiments at the ticipate in the surprise expressed by you, in ublic institutions, but to be careful in the a recent Number of The Lancer, at the election of patients, especially those affected proceedings relative to medical contracts, election of patients, especially those affected proceedings relative to medical contracts, with amaurosis, for it was impossible, he still manifested by the guardians of several casidered, that any remedy could accom- unious, much less can I concur in the correctness of your strictures of the 21st inst.

on this subject.

I could relate many instances in different counties, previous to the Kent deputation, where guardians, uninfluenced by assistant commissioners, have exercised this discretionary power with humanity to the poor and justice to the medical profession. I could also mention a multitude of instances, both before and since that event, where, in spite of the above recited discretionary end to important results, he (Dr. F.) stating | clause, the secretary's authorized explanation, and the reiterated official assurances in the House of Commons, assistant commissioners have most illiberally and unjustly interfered in these matters, either dissuading them from the pursuit of an enlightened and judicious course, pandering to their parsimony, or ministering to their meanness. Boards of guardians, in general, need not such assistants; and it is equally true, that had those bodies been left to their own feelings, knowledge, and discernment, infinitely less evil, and much less injustice, would have been perpetrated in the medical arrangements.

Wide LANCET, No. 027, p. 747.

In the Wycombe Union, formed some fered. The former offered a Loudon medi-months sin cc, the guardians refused to ad cal man at a lower rate, at the same time-mit of medical districts, though urged to it declaring that the election just make would by Mr. Sub-Commissioner Gilbert. He, not be confirmed. The latter proposed a however, succeeded in persuading the Board, sum scarcely equal to two-thirds of that after having unanimously agreed to the claimed by the successful candidates.

adoption of a low scale of graduated payThe guardians, however, after mu ment, proposed by a medical man of ac-cussion, would not accede to this, but sti-knowledged talent, experience, and liber mately were induced to propose a considerrality, to abandon their design, and force able reduction of the original terms. Con-

rivalry with his associates, declared publicly tral Board—the Poor-Law Commissioners and privately, "that the medical men of have signified to them in writing," that, Buckinghamshire had given him so much under the circumstances, they will allow the trouble that, on all occasions, he would medical appointments to continue only surge the guardians to procure medical offitil the end of the perochial year; at the same cers from London"—" that although they time they consider the remuneration prohad caused him most trouble, yet he could posed too high, and such as they will not feel always subdue them by introducing very justified in sanctioning in future." clever young men from Somerset House, where there was always a long list of them in the possession of the commissioners."

The Aylesbury Union comprises forty parishes, and contains a population of more than 22,000, with districts most preposterously and perniciously arranged in reference to the medical duties, and is it not less than twenty miles in extent in one direction. During the formation of this union, that sagacious gentleman Mr. Gilbert gravely inquired " whether one medical officer would not suffice for the entire Union."

When the Union was formed, in September last, he took an active part in dividing it into four arbitrary districts for the relieving and medical officers, and suggested terms for the latter to which none of the the antidote. resident practitioners could accede. Union was disposed of to three individuals; two from London, one having two districts, who are engaged to discharge the medico-parochial duties lately performed by Whether the medical men in Desixteen! vonshire have proved more compliant than those of Buckinghamshire, or whether this gentleman there continues his pragmatical proceedings, our brethren in the South, 1 dare say, can inform you.

In Hertfordshire, after a contract had been ratified, the assistant commissioner. Mr. Adey, refused to sanction it till 7s. 6d. was substituted for 10s. 6d. for midwifery, in and out of town. In Bedfordshire, guardians have been officially informed that the commissioners would not allow more than 7s. 6d. for this important item. This gentleman has publicly declared, " that, notwithstanding medical men now complain of inadequate parochial remuneration, they will receive much less next year.'

In the Thame Union, where the medical appointments have been made within this last month, and where the highest tenders were accepted, the Assistant Commissioner, Mr. Guison, and the Central Board, inter-

The guardians, however, after much disthe medical men, by modern threats, to tracts, on these abated terms, were then accept a shamefully inadequate stipend.

ratified by the guardians, for twelve months. This functionary, doubtless, in laudable Within these few days, however, the Cen-

If further evidence could be required to show the spirit actuating the Central Board towards the medical profession, and to declare the hopes we may entertain from that quarter, surely their last Report to Lord John Russell * will furnish abundance. That report can be proved to be no less replete with unwarrantable aspersions and unfounded imputations, than distinguished for the arrogant folly and the ignorant credulity of its subordinate concoctors. It may, in its characteristics, stand unrivalled; but I am happy to say it will not remain unanswered. I do hope, as you suggest, that it will at once engage the serious attention of the profession in general; and that, since his Lordship has the bane, he may also have

By extensive union, cordial co-operation, and an appeal to the Legislature, supported by authentic facts, existing in abundance, I cannot doubt that the honour and respectability of our profession will be best vindicated and most successfully maintained.

I am, Sir, your obedient servant, ROBERT CEELY. Aylesbury, Nov. 30, 1835.

METROPOLITAN DEGREES IN MEDICINE.

To the Editor of THE LANCET.

SIR,-I perceive by the daily papers, that it is the intention of the Government to "incorporate by charter certain persons eminent in literature and science, as the University of London, with power, after examination, to confer degrees in arts, law, and medicine." It is also stated, that didates for degrees must produce nials of having gone throu of study, either at the "

" Vide LANCET. NE

at the institution now denominated "The throughout exerted yourself to obtain a London University."

sigNow, this does appear to me to be meither more nor less than a continuance of the old system, and to imply that the examination for degrees, at the new "University of London," will be as useless as that process has hitherto been in other quarters. If it is not a perpetration of the old scheme under a new name, why is it necessary that a regular course of study should be "gone through" at any institution whatever? The circumstance that a candidate has passed a certain number of years in professedly educating himself anywhere, is no proof of the ability or attainments of the professedly educated individual; and it is a fact which cannot be disputed, that many persons have attained degrees, in our two great universities, without presenting any solid claim to the possession of those marks of distinction. So that it would seem already, that neither certificates of having studied, nor the fact of having passed an examination under the influence of the old system, is any guarantee of qualification to hold a diploma.

But suppose we admit that the examination will prove so good, that none but competent men can pass the proposed examination. What then is the use of certificates of " conrses of study?" Why should only those who can afford to obtain their knowledge at a university, be qualified to become candidates? The adoption of such a system necessarily excludes all but the comparatively rich. The want of means must prevent many able young men from pursuing their studies in an English university, but who, in the retirement of a private study, would attain a degree of knowledge which is far beyond that possessed by the inajority of those who go through "courses of study," and obtain degrees. It does not matter how knowledge is obtained, - whether in the solitude of Welsh mountains, within the walls of a university, or amidst the din of a metropolis,—whether in Wales, France, or England. If the knowledge be but obtained, its possessor is equally worthy.

But, perhaps a fear is entertained by certain parties, that such an arrangement would increase the labour of an examination, because much which ought to be proved at an examination, is now taken for granted, or would be so, under the " course-of-study' system. But, even were more labour required, such labour would not be lost, for the worthiness of the possessor of degrees would thus be ensured. We might then look upon a degree as a thing of value, -as the evidence of a fair and adequate test of one, would first have proved before at and renown that he had de-

Barthard Street

pure mode of government in our metropolitan collegiate institutions. I have, therefore, no doubt that you will insert these remarks in THE LANCET, and give the liberal side of the question all the support in your power. I am, Sir, yours truly, STUDENT.

London, Nov. 28, 1835.

MEDICAL REFORM IN IRELAND.

To the Editor of THE LANCET. SIR,-In the last Number of your truly independent journal you have been pleased to notice and comment on a lecture lately delivered by me in the Peter-street School of Anatomy, Medicine, and Surgery, in which I introduced the important subject of medical reform. Judging from certain passages in the commentary I am induced to think that your reporter must have either mistaken my meaning, or otherwise (unintentionally no doubt) fallen into error in reference to some points connected with the discussion of this very interesting topic. In order to prevent misconception or misunderstanding in the minds of the readers of THE LANCET, may I beg you will give insertion to the following explanatory observations in your next Number? In the commentary the following passage is to be found :-

"So far, therefore, as the act of divesting the theme of its ioniginary horrors, and of calling general attention, by personal appeal, to its examination, is a meritorious one, we cordially concar in the favourable estimate which we hear was formed by his additors of the manner in which Mr. Ellis discharged the daty he had undertaken. But if our report lecture be correct, we cannot state that we think his canneration of medical abuses was so comprehensive as it should have been in a discourse professedly de-voted to their discussion. Some of these omissions voted to their discussion. Some of these omissions are; indeed, so remarkable that we incan to notice them. In our experience every sound reformer has always looked upon the system of computory apparenticeships as one of the baneful usages of the surject profession in Ircland. They have also every itought the scale of fees to sinces haspital practice most oppressively and thiquitionly anjast. Yet, upon these two important items in the catalogue of medical abuse, no opinion was given in the oration apon these two important items in the catalogue of medical abuse, no opinion was given in the various of Mr. Ellis. In these confisions, which we presume were accidental, he was aeither just to himself, nor to the question which he designant to advocate, and he ought to have forecess that the absence of condemnation of surh glaring and no orisms features in the picture of medical economy in these countries, only his wise many justice, expuse him to the unsworthy apopicion that he was performing the play of Hamilet 'with the part of Hamilet left out by special desire.'"

I consider the first sentence of this passage complimentary to a degree quite beyond my humble deserts; for, in my opinion little praise is due to a person for the mere discharge of what he conceives to be a duty which he owes to the public, the profession, and the situation which he may chance to tanguished yourself in occupy in society. If I were so fortunate reform, and have as to obtain the approbation of my hearers much more attributable to the "good cause" in which I was embarked, than to the ability of its talentless, though zealous, advocate. In the second sentence you candidly assert that "if your report of the lecture be correct," that you do not think that my "enumeration of medical abuses was so extensive as it should have been, in a discourse professedly devoted to their discussion." Here, in the first instance, you have been led into a mistake; for, although the advertisement to which you make allusion in the first part of your commentary did announce that the "important subject of medical reform" would be introduced, it did not state that the lecture would be exclusively "devoted" to the discussion of medical abuses; and, indeed, even if it were, your reporter ought to know that "the catalogue" is much too long to be elaborately discussed within the short period usually allotted to a lecture. The fact is simply this; the lecture in question occupied an hour and three-quarters in its delivery; the first half-hour was spent in general observations on the subject of medical education, and the remainder of the time was devoted to the exposure of some of the most glaring of the countless and multifarious abuses with which the medical corporations, and the hospital and dispensary establishments of these countries, abound. will, therefore, I trust, give me credit for veracity when I assure you, that if I have failed to satisfy your reporter in the length of the discussion and in the character of the numerous topics it involved, the omissions complained of, if real, could be more fairly attributed to want of time than any disposition on my part of suppressing truth "by special desire," as delicately insinuated by the commentator on "the report. states that some of these omissions are indeed so remarkable that he means to notice them, and then goes on to say, that in his "experience every sound reformer has always looked upon the system of compulbaneful usages of the surgical profession in understand what the writer of this passage means; there is no such thing, nor has there been since 1828, as "a system of compulsory apprenticeships in the surgical profession in Ireland." Am I, therefore, to be censured because I did not betake myself to the tomb of a defunct monopoly, and exhume therefrom, as a topic for discussion, the ashes of an abuse which has had no material existence for the last seven years, when I found myriads of living and substantial ones obtruding themselves on my attention, and leadly demanding exposure? Would time

* This was an error of the press. The wood accidentally obtained its place in the page, after the make of eracers was aftered against in at the proof.—Er. L. signs, and in this wi

on the occasion alluded to, my success is permit, or common tense tolerate, such a line of procedure?

On the subject of hospital feet I believ I did not make any direct or specific observations; however, by a reference to the report, "if it be correct," it may be inferred that I am favourable to their total abolition. provided the medical officers be otherwise remunerated for their attendance, ar the time and trouble bestowed in giving clinical instruction to the pupils. When speaking of the French system of medical education I expressed an opinion favourable to it, and explained at the same time that there were no fees demanded from students for the privilege of witnessing hospital practice in Paris. I may here perhaps be permitted to add as an item in my defence against the insinuated charge of wilful omissions, that the pupil-money received at the Jervis-street hospital, to which I belong, is applied to the support of the institution, whilst the surgeous are left unrequited, not only for their professional attendance on the patients, but likewise for the time and trouble consumed in imparting clinical instruction to the pupils.

The last charge advanced is contained in the following passage. "In speaking for example, of hospital appointments derived by 'purchase' and 'descent,' our report of his lecture describes him to have said that the persons who are concerned in this infamous traffic and practice are warranted in their proceedings. Making every allowance for the intention of condemning the crime and saving the transgressor, which we consider to have been the object of Mr. Ellis in this nice discrimination, it is unquestionably true that no man has a right to enter into a compact which will be of detriment to the public welfare." Here again the reporter must have mistaken my meaning, if he supposed that I meant either to justify or defend in an unqualified manner, either the actors or the means by which the appointments alluded to are generally effected. However, when I express myself thus, I by no means admit the correctness of the assumed premises that all such appointments must necessarily "be productive of detriment to the public welfare." For instance, suppose a case in which an hospital surgeon, or physician, has, either from excess of occupation, indisposition, indifference, or any other cause, performed no part of the duties of his station, with the single exception of receiving annually his dividend of the pupil fund; yet he will not resign, and, unfortunately, he has enough of friends on the managing committee to save him from Opulsion. Now, would it not be more conductive to the interests and the objects of A tution, and "the public welfer a person could be induc be compelled, under the

inary exemplification, either of contempt of obligations seriously imposed, or of human lepravity, as exemplified in our medical occurs. I could, in support of my argunear, name, if necessary, an individual who as practically illustrated by his conduct for the last twenty years the truth of the position I here lay down; and I could likewise nention three or four instances of salulary exchanges which have taken place in pospital appointments, although they were effected chiefly by private arrangement. Give me leave to add that, in my opinion, the man who obstinately perseveres in monopolizing an important medical situation, and will, in the dog-and-the-manger fashion, neither do the duty, nor resign, but takes advantage of his spurious interest and vitiated influence with a corrupt committee, is much more culpable than a person who would vacate even for a pecuniary consideration. As long as the present system is permitted to continue in operation, and human nature remains what it is, moralize as we may, nepotism, patronage, and money, will exert a preponderating influence in determining medical appointments, both in Great Britain and Ireland, and the "infamous traffic and practice" will go uninterruptedly on, until restrained by the powerful arm of legislative cnactment. It appears to me that the adoption of the principle of the concours in reference to hospital appointments in these countries would be the most efficacious method of putting a stop to the "flagrant abuse" complained of; and that it is only by rendering the commission of "the crime" impracticable, that "the weapon" can be effectively wrested from "the aggressor." This is the opinion I expressed, and the doctrine which I endeavoured to promulgate, when delivering my unimportant sentiments on the important subject of MEDI-CAL REPORM.

I have the honour to remain, with great respect, your obedient humble servant, ANDREW ELLIS.

47, William-street, Dublin, Nov. 28th, 1835.

DELIRIUM WITH TREMOUR.

To the Editor .- Sin,-Your correspondent respecting Delirium Tremens, in your last Cumber, - and who need not have apryd anenymously in the matter,—is certainly correcting that I have insiderently over-ing that I have insiderently over-ing the control of the control of the control of the inside that my article on the wands as the time; this

setent successor who went be loth a pleating and a pride in faithfully discharging be important offices which his sense of duty sould imped him to finfil? This is by no neans an extravagantly conceived, or imatinary exemplification, either of contempt of chilotachesis seriously imposed or of human in the contempt of chilotachesis seriously imposed or of human in the contempt of the contempt of conte of it which is devoted to delirium tremens methodi-cally arranged into " Symptoms," Causes," " Diag-noris," and " Treatment;" but I could not find the noria," and " Treatment!" but I could not find the distinctions in question moter either of the heads "Apoptoms" and "Disguosia," where I experted to find their, and it was not muit! I had arrived nearly at the conclusion of the "Treatment," that I found the subject adverted to, and there only in an incidential manner. I may take occasion to state, that the first case which directed my attention to take distinction in question occurred in a dispensary patient in 1821; and that, about (my para ago, I attended, whith a few months of each other, three cases of the disease, with Mr. Houlton, of Lieson Grove. a sentlemen well with Mr. Houlton, of Lisson Grove, a gentleman well known to Dr. Elliotson and myself for his extensive literary and scientific acquirements, as well as for his experience; and one of those cases presented the inexperience; and one of those cases presented the in-flammatory characters, and occurred under the cir-cumstances which I have detailed at length. I do not dispute that the distinction was made about the same dispate that the distinction was made about the same time by Dr. Elliotson and myself; but that I have been indubted to his lecture I mengulvocally deny. Whoever will first read Dr. E. 's lecture, and imme-diately afterwards my articles on "Delirium," and "Delirium with tremon," will find listermal evidence of my originality. If I may ladge from my feelings and habits, I should lifer that, in glaneing—for I and do no more in many instances, even where I make references—over this lecture, I perceived nothing which particularly stuck me, otherwise I won'd have taken further notice of it; and that the topic in question should have escaped me is not sur-prising, when the head under which it was noticed, prising, when the head under which a was sound both briefly and incidentally, is taken into account.

I am, Sir, your obedient servant,

James Corland.

JAMES COPLAND. Bulstrode-street, Nov. 39, 1835.

CORRESPONDENTS.

WE have received another communication from Mr. ROGERS, in reply to the letter of Mr. G. Bury, relative to the proceedings at the late inquest at Farnham. We think we shall best consult the ends of justice by excluding from our columns any further remarks on the subjects in dispute until we have obtained on official copy of the depositions taken at the inquest. It is not necessary to say one word in justification of the conduct of Mr. Rogens. He has manfully stepped forward to protect the character of an innocent man; and in doing so, will obtain the approbation of every just intelligent member of society.

WE have not space for the letter signed C., but we give insertion, for the satisfaction of the writer and the information of his friends, to the following passage, which is strictly applicable to the case, from the excellent work of Jervis on the office and duty of Coroners. Nothing can be more evident than the fact that no inquest should have been held on the occasion in question :-

"The dying suddenly is not to be understood as relating to a fever, an apoplexy, or other visitation of God, and Coroners ought been afterwards added not in such cases, to obtrude themselves

stituting inquiry, but should wait until they of compileory residence which his proposition has a season for by the peace officers of the wider, cannot obtain from us any support as a particular to whom it is the duty of those in our accordance of the whose bounces or constructed degrees in sec. into private families for the purpose of innocuir, to make immediate communication.

whilst the body is fresh, and, if possible, whilst it remains in the same situation as tweether of the same of the same situation as twice the person died. But, under whatever circumstances, this authority must be exercised within the limits of a sound discretion; and unless there be a reassable ground of suspicion that the party came to his death of the proceedings of the kinds of the proceedings of the first party came to his death of the proceedings of the kinds of the proceedings of the kinds forwarded to usely his, M. May, that appear in the next Number of the Tue Langar.

Palla Justition and the letter of the proceedings of the proceedings of the state of the proceedings of the proceedings of the state of the proceedings of the state of the proceedings of suspicion that the party came to his death by violent and unnatural means, there is no occasion, except in the case of a person dying in jail, for the interference of the Coroner. In fact, Coroners have, on several occasions, been censured by the Court of Tiedemann. The likeness, taken while the King's Bench for holding repeated and un. King's Bench for holding repeated and unnecessary inquests, for the sake of enhancing their fees, where there was no reasonable probability that the deaths occurred from violence or unnatural causes.

LECTURES

DISEASES OF THE BRAIN AND NERVOUS SYSTEM.

NOW IN THE COURSE OF DELIVERY IN THE UNIVER-SITY OF PARIS.

By M. ANDRAL,

Physician in Chier to the Hopital de la Pitie, and of Paris.

LECTURES II. & III. CONGESTION OF THE BRAIN.

GENTLEMEN,-In our last lecture I insisted at some length on the various difficulties which present themselves in the study of diseases of the nervous system, and into the history of diseases of the central nervous system, by which we mean the brain and spinal marrow. Let us commence with lesions of the circulation, and, first, with hyperemia, the most simple form. After congestion, we shall take up the history of inflammation, then pass to anemia, and, finally, terminate this portion of our subject with hemorrhages of the brain and spinal marrow. Such is the method we propose to adopt. As for inflammation of the meninges, it occupies our attention when we describe the diseases of serous membranes in general, we shall not, course.

Anatomical Forms of Cerebral Hyperemia.

cumscribed portion of the brain. It may, again, attack simultaneously both hemispheres, or it may be confined to only one, and this latter circumstance is not of very rare occurrence. When thus limited, the hypercmia very often gives rise to symptoms closely resembling those of cerebral hemorrhage, from which it is almost impossible to distinguish it. In some cases the congestion is bounded to a single fraction of the hemisphere, and, finally, cases have been observed where the injection was confined to one of the cerebral lobules. Professor, and Lecturer on the Principles and Thus you see, gentlemen, the phenomenon Practice of Medicine, in the Faculté de Médecine which now occupies our attention may follow exactly the anatomical divisions of the organ that is the seat of the malady. This is a curious circumstance, and not confined to the brain alone. How frequently do we observe the same thing in the lungs, where the inflammation sometimes occupies both sides of the chest, sometimes attacks but a single lung, at other times affects one lobe, endeavoured to explain the nature of those or, many, as in the confined to the ramificasome of the principal means by which they the only divisions of cerebral hyperemia; it may attack more particularly either the gray or the white substance, the congestion existing at some point of the surface of the brain, or being situated more or less deeply towards the centre of the organ. Hyperemia of the nervous centres may also be found in other parts of the brain : thus, it is not rare to observe a greater or less congestion of the pons varolii, or of the cerebellum; and in this latter organ, as in the cerebrum, the congestion may occupy the middle, or either of the lateral lobes. Finally, the spinal marrow alone may be affected, either generally, or at any one therefore, refer to it during the present point, from the protuberance to its termination in the cauda equina.

Here let us first examine briefly the anatomical characters of cerebral hypere-Hyperemia of the substance of the brain, mia; they are, in most cases, sufficiently br, in the coloration of the cereery common disease of the nervous sys- bral substance in cases of hyperemia is of be different forms under which it two kinds, presenting,—1st, either a uni-belf are numerous and vari- form reduces—or, 2nd, a reddish colour meneral, occupying the from a number of small red points that pebral substance; or occupy its substance. These two forms to a certain cir. again differ, as they may occupy the white or the gray cerebral matter. The spotted | died of an acute or a chronic disease, for inredness (rougeur pointillée) is most remark-individuals who are rapidly cut off by the able in the medullary portion of the brain, and when the latter is divided into thin spinal axis are more injected than in those slices, the surface exhibits an immense number of small bleeding points, as if it were scattered over with a quantity of fine has died of acute pneumonia, the other from red sand. These points are nothing but the orifices of so many divided vessels abnormally injected, and the peculiar appearance has given rise to the term " sandy injection," adopted by M. LALLEMAND and some other writers. This form of injection jection," may be general or partial, and is much more characteristic of hyperemia than the second form, in which the redness is uniform. The gray substance is more frequently the seat of this second form of coloration; however, in some cases it may exist in the white or medullary portion. In the gray matter it presents a great variety of shades, from a deep red, similar to that of mahogany, to a light or delicate rosy tint, and it has been observed to occupy either the substance forming the convolutions, or the gray matter which is disseminated through the different points of the cerebro-spinal mass.

In the greater number of cases of cerebral congestion, the anatomical changes are not confined to the brain alone; its membranes show at the same time more or less marks of hyperemia; the meninges are usually more injected than natural, and the veins of the pia mater in particular are large, and distended with a quantity of dark-looking blood; the sinuses of the dura mater are also engorged, and the whole organ bears marks of the irritation which has occupied it. In some cases we find troubled, sometimes clear, scrum in the ventricles, or in the cellular tissue beneath the arachnoid; sometimes, on the contrary, the surfaces of the brain are free from humidity, and the scrous membrane in particular scems to be in an abnormal state of dryness. We must attribute the presence of the serosity now alluded to, to an interruption of the circulation through the brain, in a word, to a mechanical cause, and when the congestion has been carried to a very high degree of intensity, we may find not only serum, but blood, effused from the vessels. It is necessary, however, to remember, that the blood is not effused into the nervous pulp, but into the cellular tissue, by which the different parts of the train and its various fibres are surrounded and supported.

We have now laid before you a rapid sketch of the several anatomical forms under which cerebral hyperemia may present itself, but it is of importance to observe that, in order to determine after death whether the phenomena we witness really belong to true hyperemia or not, you must take into account the two following circumstances. In the first place, you must take bral mass. You winto consideration whether the patient has examples of this

spinal axis are more injected than in those who die at the termination of a chronic malady; thus, in two patients, one of whom phthisis, the brain may exhibit very different degrees of injection. In the selbud place, we should be acquainted with the nature of the individual's death, as, for example, whether he died from asphyxia, &c. In this case we know the injection of the cerebral substance is always well marked, and cannot be regarded so completely as a pathological condition, as if the same degree of coloration were observed in a person who died of a tubercular affection. Finally, we should pay attention to the circumstance that some parts of the brain in a normal state are more deeply coloured than others; thus the gray substance appears much less vascular than the white; the cerebellum than the cerebrum; and, on the other hand, the age of the individual is not without some influence on the degree of injection in different parts of the brain; in the infant the white substance contains more vessels than in the adult; and in the adult more than in the aged person; and hence the brain of old persons, which presents the same degree of injection as that of a child, ought not to be regarded as being in a normal condition.

Influence of Temperature &c. on the Brain.

Let us now turn to the causes which promote the development of hyperemia of the cerebral hemispheres; and, first, as to the exterior world. In what manner does the atmospheric temperature influence the production of this disease? for, that it has an influence, and a very considerable one, we cannot permit ourselves for a moment to doubt. Experiments made upon animals, and the observation of certain cases in man, prove indubitably that an elevated temperature is one of the most powerful causes of cerebral congestion. Let us then examine, in the first place, the effects of heat. If we take a range of between twenty and fifty degrees (centigrade), and above fifty degrees death rapidly ensues, -if I say we assume this range as representing an clevated temperature, we shall find that in from fifty to forty degrees the economy may either resist the heat, or the individual dies rapidly, with all the symptoms of cerebral hyperemia. In from forty to thirty degrees the same phenomena are observed, but the congestion is usually less intense. In some cases, where death has ensued from exposure to a heaf degree, nothing has been found be ple congestion of the brain; was effused into the sub

Medicale, vol. 70, page 250. In proportion as physician, in which electro-puncture was the temperature descends, the acoldents of practised; at the moment the needle was which we speak become more and more rare. We may observe them at from thirty-five to thirty degrees, but at from thirty to twenty the tendency to cerebral congestion disappears, and within this latter limit its frequency ceases to be in direct proportion to the elevation of the temperature. Thus, gentlemen, an elevated temperature certainly has an influence in the production of cerebral hyperemia. I need only cite in proof the fact, which has frequently been witnessed in the course of very hot summers,-viz. the sudden death of reapers and other individuals employed in collecting in the harvest.

Again, a very low temperature has also a powerful influence in determining congestion of the brain; indeed, we may say a greater one than heat, if we except artificial temperature, and regard only the effects of climate. Thus, in Holland, it has been shown that cerebral congestions are more frequent in winter than at any other scason; this has been determined from a statistic of twenty years;* and at Turin, observa-! tions made with the same object for twentyfive years lead to a similar result. + Finally, who does not remember the unfortunate hiscoma and death ! Persons who pass suddenly are also exposed to cerebral congestions.

There are cases in which we see this hyany known cause, in a number of individuals at the same time, and reign in a manner altogether epidemic. M. LEURET has published some interesting cases of this kind, which you will find in the Journal des Progrés, 2nd series, vol. 2. Three individuals were suddenly attacked at Charenton with the symptoms of cerebral congestion; two died, and the substance of the brain appeared excessively injected, without any other alteration: at the same time many other individuals in the neighbourhood presented some slight symptoms of cerebral em-barrassment. M. Levrer could discover nothing to explain the circumstance, except a very strong south-west wind, which had prevailed during several days.

ith regard to electricity, I have very little a any. Observations are wanting to enable o form a decided opinion; however, we tion the case cited by a foreign

Publique &c., vol. 2, p. 231.

placed in communication with the electric fluid, the patient experienced a sensible pain in the head. We may apply the same remark to the influence of light in the production of hyperemia, as we have just done to that of electricity. We do not possess sufficient data to form a judgment; all we can say is, that only one-sixth of cerebral congestions commence in the night.

Effects of Stimulants and Narcotics.

The effects produced by alimentary substances on the development of hyperemia, have been considered by some writers as demonstrated; we can conceive how a rich and exciting diet may, by generating a greater quantity of blood in the system, favour a determination towards the head; but we think, that at the same time a predisposition must exist on the part of the individuals. On the other hand, alcoholic drinks have, beyond all doubt, a powerful influence in the production of the congestions under consideration, and we are induced to think that they may act not only sympathetically from the stomach, but also exercise a direct influence on the brain itself: this is the more probable, betory of the retreat of our armies from Russia cause after death the odour of alcohol has during a season of unexampled severity? been found disseminated through the sub-M. Launer and the other surgeons inform stance of that organ. Narcotics also may us, that the greater part of the persons who have a direct influence in determining cere-died during that retreat were affected at bral hyperemia; no matter how introduced first with vertigo, stapidity, &c., and then into the economy, or under what form, as fell into a state of somnolence, followed by opium, belladonna, tobacco, or prussic acid, we always find after death an identical from one extreme temperature to another, lesion, consisting in a greater or less hyperemia of the nervous centres. But these congestions have something special in their percinia declare itself suddenly, without character, something which prevents us from regarding the anatomical lesion as the whole disease. Observe cases of poisoning produced by narcotics, and you will convince yourselves that the brain must be the seat of modifications, which the scalpel indeed does not reveal after death, but which are proved by the diversity of the nature of the accidents that occur during life. A question which has long occupied physiologists with regard to the action of the substances now alluded to is the following :- " Do the special symptoms produced by each of these substances, depend on the influence each exercises on a special part of the brain?" If we rely on the experiments of several physiologists who are worthy of confidence, we must resolve this question in the affirmative, and believe that opium most readily produces congestion in the hemispheres of the brain, alcohol in the cerebellum, nux vomica in the spinal marrow, and belladonna in the tubercula quadrigemina. This latter fact especially would seem to result from the experiments of M. FLOURENS: but we must remark, that all these deductions have been drawn from

animals, and that the observations hitherto | From Derangements in other Organs made on the human subject, have neither confirmed in a sufficient manner, nor, on the other hand, have disproved, the results at which experimenters have arrived.

Congestion from Causes within the Brain.

Internal causes have a far greater and more extensive influence than agents which operate from the external world; we can discover various conditions of the brain itself that favour in the most evident manner the production of cerebral congestion: thus a forced exercise of the intellect, long-continued and severe study, powerful emotions, relapse. May we not refer the sleepiness such as fear and joy, the passions, &c., may in turn give rise to the several accidents that characterize hyperemia of the nervous centres. It is unnecessary to cite examples in support of this assertion : you will manifest influence in the production of cerefind them in every author; and your ex- bral hyperemia. Thus, in childhood, acute perience cannot fail to have furnished more inflammation of the stomach and bowels than one proof. Certain diseases of the brain, again, have the effect of determining in the organ a degree of congestion which has erroneously been regarded as the cause allow the cerebral effects of excitation in the of the malady itself; as in epilepsy, which digestive tube, all we shall say, with respect disease certainly does not depend upon a simple hyperemy of the brain, although the flammation of the mucous membrane may be congestion which accompanies or succeeds each access, may become the cause of certain accidents that we observe in epileptic patients. It is on this principle that we would sists for a greater or less period after the Jysis, contraction of the muscles; and, finally, whom the injection of alimentary substances various other symptoms of cerebral derange-in too great quantity invariably give rise ment. Accidental products in the brain, as to cerebral symptoms; the face became tubercles &c.; the cysts which succeed coloured, she was affected with severa handon old apoplectic effusions, hydatids, and several other products of the same kind, may all act as so many centres of irritation, mory : these symptoms sufficiently indicate and give rise from time to time to an hyperemy, varying in intensity and extent according to the cause which produces it. When congestions take place round the foreign bodies, as we may so call them, two orders of symptoms arise; the first are often permanent, and depend on the presence of the accidental product. The second are intermittent, like their cause, and are produced by an occasional congestion round the point of irritation. It is thus that we would account for the intermittent convulsions of children affected with tubercles of the brain, giving rise from time to time to accesses of hypercmia, and this is a remarkable example of intermittent phenomena produced by a permanent organic lesion. Finally, the different degrees of meningitis, especially when the disease is chronic, may often give rise to corresponding congestion in the neighbouring portion of the cerebral hemispheres.

Systems.

The causes external to the brain are next in order. The influence exercised by the different organs, whether healthy or in a state of disease, on the production or relapse of cerebral congestions, merits our attention. And first for the digestive tube.

We may affirm, without danger of error, that certain acts of the stomach may occasion the development of cerebral congestion. particularly in individuals who are predisposed: thus, a too active function of digestion has more than once been the cause of affecting certain individuals after a full meal. to a slight degree of the same congestion? A pathological condition of the stomach does frequently, and beyond all doubt, exercise a may be accompanied by accidents that announce the existence of congestion in the brain; however, though we are willing to to typhus fever, is, that here possibly the inthe cause of cerebral congestion, as it frequently accompanies that disease.

A chronic affection of the intestinal canal may likewise produce congestion of the explain the comatose state which often per- brain; but much more rarely than acute sists for a greater or less period after the gastro-enteritis; however, we cannot doubt access; the troubles of intelligence, delirium, its influence in some particular cases. Thus &c.; certain disorders of movement, as para- I have had occasion to treat a lady, in ache, ringing in the cars, weakness and numbness of the arm, and even loss of mean excess of blood in the brain, and what is remarkable, they never appeared except in consequence of some error of regimen. In another case, that of a patient labouring under chronic gastritis, every time the affection of the stomach became exasperated, the patient was seized with paralysis of the arın.

> Irritation of the small intestines may also be arranged amongst the undoubted causes of cerebral hyperemia. Who is macquainted with the effects of prolonged constitution in determining the blood towards the brain?

> The circulatory opparatus may, also, by its various conditions, produce different degrees of cerebral congestion. It is easy to conceive how the various degrees of force which the blood is carried to the influence the development o that organ. We have fre of sceing patients subje tions of the heart. In

tion of the circulating medium is accom-panied with giddiness, ringing in the ears, and other symptoms of congestion in the brain. Again, any obstacle to the free return of blood from the head may give rise to a similar result. Sometimes the impediment exists within the cavity of the cranium; the researches of Dr. Tonnelle prove in a staking manner the coincidence of hyperemia, and even cerebral hemorrhage, with an obliteration more or less ancient of one of the sinuses of the dura mater. (Journal Hebdomadaire, April 1830.) M. GINTRAC, of Bordeaux, has related a case in which the congestion was caused by an obliteration of the longitudinal sinus. A tumour pressing on the jugular vein may also hecome a cause; and the congestion observed in malefactors who have been hanged, evidently depends on the same circumstance. viz., a mechanical obstacle to the free return of blood from the head. A change in the circulation of the brain is often produced by very slight causes: thus in some individuals, a mere change of position from the vertical to the horizontal posture, and vice rerea, is enough to occasion vertigo, and some persons can never get up or lie down in bed without experiencing a similar sensation.

The disease termed apoplery of new-born children may be, in most cases, attributed to an obstruction of the venous circulation from the brain; and instances are on record where death has been produced by the pressure of the chord round the child's neck, causing a fatal congestion of blood. Finally under this head, we may arrange the effects of certain violent efforts, such as the act of vomiting, defecation, &c.

The different organic diseases of the hearl, which oppose the free return of blood from the head, or by turns retard and necelerate the circulation in a remarkable manner, must also be ranged amongst the causes that give rise to cerebral hyperemy. Nor are we to neglect the influence evidently produced by simple acceleration of the circulation during the course of ordinary or intermittent fevers. We cannot certainly explain in any other manner the headache, giddiness, pains in the limbs, &c., which accompany every access of fever at all well marked.

The development of cerebral congestion is also favoured by the existence of inflammation in some other organ. You know that congestion forms one of the elements of inflammation, and this element may be repeated in the brain under three different circumstances, which we shall now enumerate. 1st, Before the inflammation taker place in the organ; as for example, in the same of the commandation, when we observe the existence of deficium, the coma, during the febrile active appearance of the cutter of the

time as the inflammation; witness erysiperinging in the earl, has of the scalp and face, which is often fatal, with cerebral symptoms, leaving no ther trace of lesion in the brain, than an head may give rise netimes the impediately of the cranium; and the trace of lesion in the brain, than an hyperemy more or less well marked. 3rd, The symptoms of congestion may set in after the inflammation has completely disappeared; of this we may cite examples in the congestions that follow the disappear ance of a cutaneous malady, the sudden restored in the face of a cutaneous malady, the sudden restored in the face of a cutaneous malady, the sudden restored in the face of a cutaneous malady of the face of a cutaneous malady, the sudden restored in the face of the

There are, again, cases in which we in vain seek the cause of cerebral congestion in the access of intense fever, or in the inflammation of another portion of the body: here it depends on a certain congestional diathesis, if we may so use the expression, on a morbid condition of the system, in which the different organs become in turns congested. We have seen cases where the nasal fossæ, the uterus, the lungs, the intestinal canal, and the brain, have shown symptoms of congestion, one after the other, without our being able to discover any thing in the patient's constitution or mode of life to explain this singular phenomenon. Having thus studied the effects produced by various conditions of the solids, we may ask ourselves whether the quality of the blood exercises any influence on the production of symptoms of hyperemia of the brain. We cannot doubt but that persons whose blood contains a great deal of fibrine and colouring matter, in a word, individuals endowed with what is called a sanguineous temperament, are predisposed to cerebral congestions; but on the other hand, the absence of this temperament by no means ensures a patient against the dangers of hyperemia, a disease which, as you have seen, may be occasioned by so many other causes.

Affections of the respiratory opparatus can rarely enter amongst the causes of congestion of the brain; we can only admit them as such when they produce an obstacle to the circulation, as in asphyxia or croup, and then they are to be ranged under some of the categories already mentioned.

With regard to the secretory apparatus, I may observe, that when in a normal state, the different secretions do not seem to exercise any remarkable influence in favouring the development of the disease which now occupies our attention. However, in certain morbid conditions, as for example, on the suppression of a discharge to which the economy has been for a long time accusomed, they may undoubtedly give rise to a determination of blood towards the head. Some writers have greatly exaggerated the effects arising from the stoppage of suppuration, whether once artificially excited, or originating in an accidental lesion. Although I would not deny that such effects may sometimes take place, I am inclined to think that nuch greater value has been attributed to 2nd, At the same this circumstance than it really deserves.

The genital apparatus is the last whose in- and in greater existration than if natural fluence in cerebral congestion we have now to examine. The reproductive organs, gentlemen, give rise to frequent derangements of the circulation in the brain, as well as in several other parts of the economy; this is particularly seen in young females as they approach the age of puberty. How many accidents dependent on cerebral hyperemy do we witness in young females at the period of their first menstruction ! And at the decline of life, when the normal stoppage of the menstrual flux is about to withdraw the constitution from an influence to which it has been habituated for a long series of years, how often do we see the same phenomena repeated! Finally, in suppression of the catamenia, it is not an unusual thing for the patient, at each period, to exhibit the various symptoms that indicate a more or less severe congestion of the brain.

These are circumstances, gentlemen, that you should never neglect in practice; and above all things, watch with anxiety and care the signs of congestion towards different organs, particularly towards the chest, in some young girls, at each period of menstruction; be on your guard here, I say, or you may render yourselves culpable of a fatal neglect; for in too many cases, the periodical determination to the thoracic viscera awakens a latent disease, which, when once advanced, leaves the patient without hope, and medicine without a resource. The different degrees of intensity with which an individual may ahandon himself to the generative act, also enter amongst the causes of cerebral hyperemia. Thus an abuse of venereal pleasures may become a curse, and, on the other hand, a similar effect may arise from complete abstinence.

With regard to the influence of age, I may observe, that individuals at every period of life, from infancy to decrepitude, are subject to the disease which has just occupied our attention; but we do not think it proved, as many writers have advanced, that cerebral congestion is most common in old age. We have collected numerous examples in children of the tenderest infancy, and think the only conclusion warranted by facts is, that the maximum of intensity may be placed after the age of forty.

We have now, gentlemen, touched upon some of the principal causes which give rise to congestion of the centre of the nervous system; and in reviewing them, with the design of adopting some general classification, we find that they may be comprised under three heads. Thus many cases of congestion of the hrain are evidently produced under the influence of certain mechanical forces, and this is a circumstance which can be very readily understood. Other causes art ligence is clear, the reasoning by producing a modification of force in the turbed, the memory and a circulation of the brain itself; the blood is carried to that organ with greater rapidity dangerous form Inde

and congestion is a frequent cost quence of this state. Finally, in other cases of cerebral congestion, we have a diminished activity of the vessels of the brain; the quantity of blood which circulater through that organ is reduced in quantity, and this circumstance often gives rise to functional disorders exactly similar to those occasioned by the presence of a superabundant quantity of blood. Thus, then, we have three species of causes engaged in the production of cerebral congestion; some are purely mechanical, others are active, and others are much less active or are even passive; and the three conditions resulting from the operation of the above-mentioned influences may, with advantage, be distinguished into mechanical, active, and passive hyperemia.

The Symptoms of Cerebral Congestion.

Having thus taken a brief review of the causes of cerebral congestion, let us now, gentlemen, pass to a consideration of the symptoms accompanying the disease. These are extremely different in different cases, and vary according to a multitude of circumstances which it is not always in the power of the physician to seize; we may, however, lay it down as well established by observation and experience, that the symptoms of cerebral congestion vary according to three principal circumstances: the first is the intensity of the lesion, which produces a variety in the symptoms of all diseases in general; the second is the duration of the congestive state; thirdly, and finally, the symptoms vary according to the diversity of the points of the nervous system which may be affected. These are the three main circumstances, gentlemen, according to which the symptoms of cerebral hyperemia are at one time well marked, at another obscure, and present the great diversity of appearances which render it so difficult in many cases to form a certain or correct diagnosis in diseases of the nervous system. With regard to the last circumstance, namely, the diverse points of that system in which congestion may exist, we are compelled, for the sake of order and clearness, to study, separately, congestion as it may occur in the cerebral hemispheres (or brain), in the cerebellum, and in the spinal marrow. The first of these may present itself under a variety of forms, each of which we shall describe apart, and endeavour to point out the most striking characters by which it is distinguished from the others.

First Variety of Cerebral Congestion,

In the first form of congestion to willow now direct your attention the great find tions of the brain remain intact, ti altered: this is the mo

ranged. The Principal modifications of sensibility characterizing this simple form of hyperemia are, pain in the head, which is sometimes carried to a very severe extent; vertigo; ringing or singing in the ears, momentary aberration or loss of sight, giddi-&c. The locomotive powers are at the same time variously affected: in some cases you find the movements executed with dulness and evident disinclination; the patient is heavy and inclined to sleep; while in others he is tormented with a constant desire of exercise, he is constantly on his legs, and cannot rest for a few moments without experiencing a troublesome feeling of anxiety and restlessness; in other cases, again, you will remark nothing but some fourmillemens in the limbs, or sometimes about the face. In certain cases the local symptoms seem to affect especially the circulatory apparatus. At the same time that the patients present many of the symptoms of cerebral congestion, they are attacked with frequent and violent palpitations of the heart, throbbing of the arteries, &c.; but observe, gentlemen, that these palpitations may occur under two very different circumstances, which it is of some importance to distinguish; in one the trouble of the heart and circulatory apparatus is evidently dependent upon the derangement which has taken place in the nervous system, because it does not manifest itself until some time after the symptoms of congestion in the brain; in other cases, on the contrary, the palpitations are connected with some condition of the heart or vascular system, giving rise to increased energy of action in that organ, and subsequently to congestion of the cerebral vessels. The influence of this latter cause is manifest in a great number of cases which we have witnessed. We have frequently seen individuals in whom any slight augmentation of the palpitations to which they were ordinarily subject, was constantly attended with giddiness, vertigo, singing in the cars, or even a well-marked sensation of numbress in the extremities of the fingers. Hence we are compelled to admit that in a certain number of cases the palpitations of the heart, to which we have just alluded, may either follow the derangement in the nervous centre, or be the cause of congestion, by the increased force with which the blood is sent to the brain. It is unnecessary for me to point out the importance of this distinction in a practical point of view.

When congestion of the cerebral hemiarcs is carried to any remarkable degree sity, the symptoms become more gea economy at large seems to esure of the disturbance temporal arteries now

we observe may all be selected to lesions of so violently that their pulsations may be re-the sensitivity, which is but slightly de-cognised by the eye as well as the touch; the cheeks are suffused with a brilliant red colour; the vessels of the ocular conjunctiva become injected; even the forehead sometimes partakes of the coloration of the face, and the whole veins of the head show marks of congestion; the small and large branches are equally distended with blood. In this state of the circulation hemorrhage may take place from the vessels of the nares, and dissipate all the unpleasant symptoms; or congestions may form in various other parts and organs of the body, giving rise to a number of secondary accidents; for, like most other diseases, cerebral congestion may exist singly, or he complicated with a variety of other lesions.

The species of cerebral hyperemia which now occupies our attention may present itself under two varieties, according as it is accompanied by signs of febrile reaction or not,according as it exists with what is called inflammatory fever, or is not attended with any symptoms of general derangement of the circulation. In the first cas when congestion of the brain is attended with fever, its duration is generally very limited: in the second, its duration is indeterminate. Thus, in some cases, the disease does not seem to exist beyond a few hours, after which the headache, giddiness, and other symptoms, completely disappear. In other cases, the signs of cerebral hyperemia may continue with little or no inter-mission for several months, or even for whole years together; thus, I have seen patients who showed the first symptoms of congestion in the head, at the age of twenty, and still continued subject to more or less severe attacks, up to the age of forty, fifty, or fifty five, or even during the whole life. The duration, then, of this disease is very uncertain, and may, in certain cases, be prolonged to a great length of time. Sometimes the congestion is, as it were, permanent, the patient is constantly affected with giddiness, pain in the head, noise in the cars, &c.; but more frequently it becomes suspended for an uncertain period of time. and then returns under the infinence of causes which we can occasionally appreciate, but which in many cases escape discovery altogether.

Congestion of the brain is a disease of very frequent occurrence, and when once a patient has been affected with it, the chances that he has it again are very numerous; the period of relapse is, as we have just noticed, at one time uncertain; at another, the congestion recurs at fixed periods, at the change of life, as it is called, at certain changes of season, &c. I remember the case of a patient who, during the course of several years, was attacked towards the end of every winter with symptoms of severe conforce; in some cases gostion of the brain. The accidents per-

sisted from twelve to fifteen days, and then with nearly is. When raised up they de went off, to return again at the same period not fall down in that dead bestess man on the following year. In some cases the ner which distinguishes refer but enay periods of relapse are so regular that the disease hears all the characters of an intermittent fever, so far at least as periodicity is concerned; and on examining authors you will find examples in which the access simu. lated that of a quotidian or a tertian ague. MEAD has left us the history of a man who fell down in a fit of apoplexy every year about the month of March; sensation and motion were completely lost for a few minutes, after which the individual returned to himself, but for ten or twelve minutes more he was unable to speak, and was affected with a trembling motion of the right arm; these symptoms were quickly dissipated, and the patient recovered the use of all his functions. When the return of the congestive state takes place at short intervals, it constitutes what many authors have called "intermittent apoplexy," a form of disease of which I myself have witnessed some very striking examples, and which often gives way rapidly under the administration of quinine in elevated doses.

This first and simple form of cerebral congestion may be succeeded by various others, or if it be prolonged for any considerable period of time, it may give rise to hemorrhage into the substance of the brain, or ramollissement, but in the majority of cases it may be dissipated by the assiduous employment of means which we shall have occasion to notice presently: its characteristic marks are, the intelligence intact, sensibility but slightly modified.

Second Variety of Cerebral Congestion.

Let us now take up the second form of congestion of the cerebral hemispheres. In this variety of the disease, the individual, either after having suffered for a greater or less period from giddiness, confusion of sight, and other symptoms of congestion, or without having previously experienced any of these accidents, suddenly falls down, deprived of all consciousness. This form of the malady is hence called a "coup de sang," and is characterized, as we have just said, by an instantaneous loss of consciousness, with or without previous symptoms. The patient suddenly falls to the ground, deprived at once of intelligence, of motion, and of sensation, as if hemorrhage to a considerable extent had taken place in one of the cerebral hemispheres; however, it is distinguished from this latter affection by the circumstance that it is very rarely accompanied by hemiplegia; the symptoms connected with locomotion, in cases of cerebral hyperemia, are much more frequently those of general paralysis than hemiplegia. Sometimes, however, although the individual lies without motion and consciousness, the limbs are not, properly speaking, struck severe headache is the

even remain elevated.

In the second form of cerebral congestion death may suddenly take place; the coup de sang carries off the individual as rapidly as an access of apoplexy; in other cases the attack may last for some hours; the patient may remain in a comatose state from a lev minutes to twenty-four or thirty hours nothing is more variable. Finally, in other cases, the accidents go off by degrees; the intelligence, motion, and sensation, are gradually re-established, and, after a lapse o time which varies as much as the duration of the attack itself, the patient is restored to the full enjoyment of his health. It is astonishing to see how rapidly the recovery may take place from a state in which the patient has lain, perhaps for a considerable time, without consciousness, power of mo tion, &c., -in a word, with all the symptom of an apoplectic stroke; yet such a case fre quently occurs in practice; and we find the individual, whom we left labouring unde the most alarming symptoms, restored t perfect health, without any lesion of move ment or sensation being left behind. I cases of this kind, we are certainly force to admit the existence of simple hyperemi of the cerebral substance; we cannot for moment imagine that actual hemorrhag has taken place, for the sudden and perfec recovery of the functions is quite incom patible with the latter supposition. Genera paralysis, then, as contra-distinguished from hemiplegia, or loss of motion in one side c the body, is the characteristic symptom of the form of cerebral congestion which w have just now described under the familia denomination of "coup de sang."

I said that the patient sometimes recover unexpectedly from the state of coma int which the undue determination of blood t the brain has plunged him; this is not al ways the case; on the contrary, the acci dents often persist in a greater or less de gree, and consist in lesions of the intelli gence, of motion, or of sensation, the thre great functions of the life of relation. Thus after the patient has recovered from th first alarming effects of the coup de sans the intelligence often remains dull and ob tuse; the patient has an air of stapidity, o looks frightened; he is unwilling to be dis turbed, or to walk about; in some cases even, we observe delirium; these symptom may persist for four, five, or six days, and then the patient recovers the full exercis of his intellectual faculties. The sensibilit, may likewise remain affected; the pader conserves for some time a sonsation of p ness in different parts of the hod extremities particularly, by with prickings in the 1

emains, and this may persist with some in- or four days. Hence, whenever the acciensity for a considerable length of time dents which succeed an attack of the kind Finally, gentlemen, certain patients present we now describe, do not persist beyond the nerely a derangement in the organs of loconotion; thus some are affected with weakiess of the limbs, incapability of executing with force the ordinary movements, and this s remarked especially in the abdominal exfor some time after the coup de sang; the impression seems directed entirely to the muscles of the tongue, and articulation is consequently imperfect and embarrassed: this latter symptom is frequently observed as a consequence of simple congestion of the brain; however, when the accidents which we have just enumerated persist for any length of time, we have reason to conclude that something more exists in the centre of the nervous system than mere congestion; the obstinacy of the secondary symptoms would indicate the presence of a permanent cause - viz. cerebral hemorrhage.

Third Variety of Cerebral Congestion.

Let us now turn to the third form or variety under which hyperemia of the brain may present itself. In this form we observe precisely the same accidents of intelligence, motion, and sensation, as in the former one, but we have something more than the general resolution of the limbs, which we give as the characteristic mark of the second variety; we here remark a phenomenon that connects cerebral congestion with hemorrhage-viz. hemiplegia, and this circumstance frequently gives rise to great difficulty in the diagnosis. I have seen patients struck with the coup de sang who saddenly became hemiplogic, and presented a combination of all the symptoms that are produced by cerebial homorrhage, but these were dissipated in a short time by the ordinary means; here we cannot admit the existence of hemorrhage into the substance of the brain; it is impossible to conceive that a clot of blood should be removed in a few hours: the accidents can only be attributed paralysis. to congestion, and we are compelled to allow that a symptom which is almost exclusively attached to effusion of blood into one of the hemispheres, may also present itself in coninnction with a simple determination to the head. This sort of paralysis is often seen after attacks of epilepsy, where the congestion which accompanies or succeeds the discase, frequently gives rise to certain disorders of movement; and, independently of the rapidity with which these accidents disappear, we have further reason for referring them simply to congestion, from the fact the state of the circulation in the brain the access, not unfrequently leaves effects on the patient's countc-

space of a few days, we may rigidly con-clude the absence of any hemorrhage into the substance of the brain.

The hemiplegia accompanying this third form of cerebral congestion may disappear nearly as rapidly as it was produced, or it may continue for an indefinite time after the complete restoration of the intellect and other functions, and in this latter case we must attribute it to something beyond congestion; the persistence of the loss of motion infers the operation of some permanent cause, which is an effusion of blood from the vessels of the brain, that has accompanied or been caused by their state of congestion. The observations which we have just made, tend to establish that hemiplegia is most commonly connected with cerebral hemorrhage, while general paralysis or resolution of the members is more frequently observed with simple hyperemia of the brain; we must not, however, generalize too rapidly, especially in diseases of the brain. The cases published by M. LEURET, show that hemiplegia may exist with nothing but an abnormal injection of the versels of the brain. I could find, perhaps, fifty similar cases in the science, which demonstrate the same fact, and hence we are compelled to draw a conclusion, which indeed will frequently present itself to us during the investigation of diseases of the nervous system-viz., that functional derangements are not always accompanied by changes of structure appreciable to our senses, and that in the case before us, some impression remains in the nervous system, causing a derangement of locomotion long after the coup de sang has passed away.

I should not forget to mention that in infants and children this form of cerebral hyperemia is chiefly shown by convulsions, and not by the production of general or partial

Fourth Variety of Cerebral Congestion.

Now for the fourth variety of congestion. In this form, the intellect remains intact; the only phenomena we observe are modifications of sensibility or motility; and let me here remark to you a fact which is well worthy of attention, namely, that in a great number of diseases of the brain the intellect remains unimpaired amidst lesions which apparently should have produced its complete destruction. Here then we have no loss of consciousness as in the former varicties. The first symptom which shows itself is paralysis, often confined to some nascles of the face, but in other cases excases, the patient pre- tending to the whole of one side of the body. on the conjunctiva, This paralysis often disappears in a rapid ich disappear in three manner, a few hours after its production; and here certainly we cannot attribute it to the effects of cerebral hemorrhage. Some very curious cases have been published, which illustrate the progress and termination of this form of congestion; perhaps one of the most remarkable is that we owe to M. Gintrac, of Bordeaux.* of which the fol- The autopsy reveals nothing but a vivid in-lowing is a brief account: "A child, four jection of the substance of the brain. years of age, had been attacked from birth by an affection which consisted in a momentary suspension of voluntary motion, that came on at intervals; the access was not preceded by any premonitory symp-toms. If the child were standing up when seized, his limbs bent under him, the trunk gave way, and he fell down at once on the ground; when in bed, the access was anthe muscles. During the attack or fit the of symptoms? Can we discover any prinsenses appeared somewhat dulied, and the ciple to reconcile the apparent contradicsensibility was diminished; the eyes re- tions we meet with? Can we explain the mained open and immovable; the sense of diversity of functional lesion by a difference hearing remained; the intellectual faculties were perfect, but the child was unable to utter a single syllable. This child died of some other disease, and on examination, no alteration was found in the brain except the transformation of the superior longitudinal sinus into a hard chord, filled with a solid clot of blood." In this form, then, we have the intellect untouched, we have some modification of the locomotive power, and we have, finally, a suspension of some of the senses, while the others remain free from injury.

Fifth Variety of Cerebral Congestion.

In the fifth variety of cerebral congestion the lesion is chiefly directed to the intellectual faculties. Hyperemia of the brain, in this case, does not produce coma; it does not exercise any very remarkable influence on the movements of the body; the principal phenomenon is the sudden appearance of furious delirium, accompanied by an extraordinary development of muscular localize the functions of the brain, but, I re force.

This form of the disease is highly dangerous, and frequently compromises the life of the individual. In some cases the dehirium is accompanied with so violent a perturbation of the brain that the patient dies in the access, vociferating loudly, agitated in the most severe manner, or making such powerful and long-continued efforts that life becomes extinct in the struggle. I have more than once been struck with the remarkable phenomenon of which I now speak. I have watched the case closely during life, examined the brain after death with the greatest care, and found nothing which could explain the excessive derangement of the intellectual functions, except marks of great congestion in the cerebral hemispheres.

In many cases this form of peremis, commencing in extreme deligination and terminating in coma, or, more descently, in an access of the most violent muscular efforts, has produced death as suddenly as it the patient had been struck by lightning

Different Symptoms from Similar Lesion.

These are the principal forms under which cerebral congestion may present itself to us; each you see has its characteristic mark. The phenomena accompanying each form are distinct, and on passing them in review we cannot help asking ourselves these questions,-" How comes it that the same nounced merely by a complete relaxation of identical lesion gives rise to such a variety in the seat or duration of the organic lesion?" I think that a solution of the questions we have now put is chiefly to be found in the different parts of the brain which are affected; and that observations establish this general rule, that the discrepancy of symptoms which present themselves in the various forms of cerebral hyperemia depends not only on the duration or the malady, but still more upon the seat it may occupy in the central organ of the nervous system; but if you wish to know what particular parts of the brain are implicated when such or such symptoms ap pear, I must confess my ignorance: the state of the science does not yet permit me to arrive at the solution of this most in teresting problem, although we have many excellent reasons for thinking that by i alone we can clear up the difficulties which now pursue us in our study of diseases of the nervous system.

Many attempts have already been made to gret to say, most of them appear to be pre mature. Thus we have several observations which tend to establish that sensation and motion chiefly reside in the gray or cortica substance, and that when this portior of the brain is injured, the two proper ties just mentioned principally suffer. Thi may possibly be the case, but we have no proof of it, and until something better i offered than conjecture, we cannot thinl ourselves justified in coming to any conclu sions; there are, however, some circum stances which lend it a colouring of probability. When the gray substance of the brain is injured, we certainly have oper aberration of the intellect than when lesion exists in other parts, and fro with meningitis, we mi that the superficies of

Here, again, many lami, the pons, or the cerebellum; indeed, this ought to be the case, but, unfortunately, experience does not enable us to say how or when. Let us not however be discouraged, but hope for better times; let us examine with greater care, let us observe more, and, above all, collect a greater number of observations; for nothing can be more irrational than the your attention. error into which some writers fall of drawattention.

Affections of the Cerebellum.

authors would thus explain.

In some periods of cerebral congestion, we observe a certain number of symptoms which it is very difficult to connect with any drunk; he is stupid, his appearance is extraordinary; when he attempts to walk, the organs of locomotion, though still capable of acting, are evidently deranged; his step by him in an imperfect manner and with difficulty. Here is a case in which we might suppose that the lesion was principally situin the cerebellum, but we cannot affirm his with any certainty. We cannot bring ed my rigorous proof of it; indeed the which have as yet been made, are bing that in this disordered motions, the cerebel-train chiefly or solely

times it is exalted in a very extraordinary degree; the patient is unwilling to be disturbed, or the least touch produces an acute cry, as if the integuments were the seat of writers will tell you that the cerebellum is the part of the brain chiefly attacked, but I must confess to you that I do not find this opinion confirmed, either by my own observations, or by an examination of the cases we possess. However, explain it as you will, the fact exists, and is not the less worthy of

There are also a certain number of ing general conclusions from two or three facts connected with this part of the subisolated facts, and attempting to explain ject, of which we shall seize the present opphenomena before any solid groundwork portunity to speak, as they seem to throw has been established upon which they can some light on a doctrine, which, though not huild an hypothesis worthy of confidence or yet established, as I said before, upon proofs, yet has some probabilities in its favour. I have seen patients who at each return of the menstrual period (and in these cases the The remarks we have hitherto made, refer catamenia are always painful), were affected entirely to one portion of the brain; but with more or less severe pain in the back of there is another part of that organ to which the head; this phenomenon was constant, peculiar functions have been attributed, and and I possess three or four facts of the kind. many authors have thought that pathologi- Again, in one case, each time the individual cal observations ought to show whether these had connection with a woman, he was seized functions have justly been attributed to it with violent pain in the oscipital region; or not. The part I now allude to is the this symptom constantly followed each act cerebellum: some physiologists place the of copulation, and was accompanied by power which governs the organs of genera-tion in the cerebellum; others connect it In relating these cases, gentlemen, I merely more particularly with locomotion, &c.; but give you facts as I have observed them; reif you examine the observations which are member I do not connect them with any recorded in the different works upon diseases hypothesis or explanation. I have also had of the nervous system, you must perceive an opportunity of witnessing a case of priathat many of these hypotheses are at least pism in a young man, accompanied by con-premature, and that we cannot refer to it a stant and very neute pain in the back of the a great variety of the symptoms which their head; this state lasted for three months, at the expiration of which time, I was sent for to see the patient, who had been suddenly attacked with alarming symptoms. On my arrival, I found him labouring under all the particular lesion, or explain by any one of symptoms of acute meningitis. This patient the hypotheses as yet formed; in these cases died, and though I had an opportunity of the individual looks exactly as if he were examining the body, the fact is not less certain; besides, the inflammation of the brain was so well characterized, as to leave doubt of its existence. Here, then, are a certain number of cases in which we may presume is vacillating, and progression is performed that congestion of the cerebellum coexisted with a series of symptoms peculiarly connected with the generative apparatus, but I would not here build up any thing on so small a number of observations.

Congestion of the Spinal Marrow.

We now come to congestion of that part of the nervous system which is contained in the vertebral canal. Hyperemia of the spinal marrow is much less frequently met thirty undergoes with than congestion of the central portion,

lambar portion. The symptoms which are symptoms continue for a length of time; connected with a congestive state of the in others we have some patients who prespinal macrow consist entirely in lesions of sensibility and motion for movement and sensibility, together with a a considerable period, recover auddenly, and few that may be referred to derangements in a most unexpect d manner. of organic life; the brain remains intact, and the intelligence consequently does not brain differs in different individuals accordpresent any of those phenomena which so ing to the seat of the lesion, and its duration, often accompany a similar pathological con- and according to the patient's mode of life, dition of the cerebrum.

take place in a rapid manner, or may be estimate. You have also seen how it often formed gradually and slowly; let us first terminates in death. When the discase, consider the rapid form. Here you may however, ends favourably, we may someobserve three varieties that we should distinct observe at the moment of its termitinguish from one another. In the first we nation certain critical phenomena that are have a special lesion of motility. The paralso found to accompany the close or detient is suddenly seized with paralysis, cline of other diseases. Thus some patients which may affect the four extremities at are relieved from the headache, vertigo, and the same time, or be confined to two of other symptoms of congestion in the brain, them, the superior or the inferior limbs. In by a copious hemorrhage from the nostrils some cases, however, which are excessively. This is a phenomenon very frequently obrare, the loss of motion may exist only in served, and must be familiar to you all. In the members on the same side of the body; other cases the musual appearance of the the patient is attacked with a true hemiple; menstrual flux dissipates the cerebral sympgia, but there you will generally find that the tons; I had a patient under my own care, lesion has implicated the brain also, and who exhibited a curious phenomena of this that the spinal marrow is not the only part; kind. The symptoms we have just werthree or four handkerchiefs in the course enumerated, are in certain cases also at of the day. tended with convulsive motions that are partial or general. In the second form of congestion of the spinal marrow the principal lesion is not munifested in the organs; the several forms of cerebral hyperemia, and of locomotion, but in the sensibility. Some-described the symptoms by which they are times we find a complete loss of sensation accompanied, let us turn to the therapeutic in various parts of the body; at others the question, and point out the principal indi-modification of sensibility is shown by cations of treatment. There are three: the prickings, or a creeping sensation in divers first, and perhaps I might say the principoints, by pains in the surface of the skin, pal, is to combat the cause which has pro-or occupying the depth of a member. CASES OF

MALIGNANT DISEASE OF THE TESTIS,

IN A CHILD AND AN ADULT.

To the Editor of THE LANCET.

Sin,-The enclosed account of two cases of malignant disease of the testis, was read at the Hunterian Society, on Wednesday last. I trust you will find it deserving of a place in your valuable Journal. I am, Sir, your most obedient servant.

GEORGE LANGSTAFF. 2, New Basinghall-street, Dec. 4, 1835.

MEDULLARY SARCOMA IN THE RIGHT TES-TIS OF A CHILD TWELVE MONTHS OLD.

The child had from its birth been perand spinal marrow; this is done by what are feetly healthy, and its body was well devetermed revulsives. The older authors con-loped. When about ten months old, an entain numerous examples of the benefit de largement was perceived in the right side rived from this method of treatment, and I of the scrotum, which increased rapidly, have more than once had recourse to it my- and bad, in the course of two months, acelf with the most decided benefit. The quired the magnitude and figure of a

The tumour had not excited any pain, rongestion have succeeded the disappearance nor was there any enlargement in the inof a cutaneous eruption, or any chronic af- guinal glands, nor any sign of constitutional fection of the mucous membranes; in disease. Its nature was ambiguous; it was cases of this kind you must not neglect the clastic to the touch, but not of that pemust take into account the antecedent ma- taining its nature, the surgeon in the counlady, and must endeavour to call it back by try who had the management of the case,

A few days after this operation, the child surface, by blisters, the seton, actual cau- was brought to London, and placed under tery, and irritating ointments; 2ndly, by my care. I examined the tumour atten-leting on the intestinal canal. Purgatives tively, and from its elastic feel and configuration, I was at first inclined to think that there was fluid in the tunica vaginalis; but hand congestion; I have had frequent from its want of transparency, and having raties of witnessing their utility, and been informed of what escaped on paracenaven more efficacions than tesis being performed, I suspected the dispat variety of cases, ease to be of a medullary character.

I must confess. I never observed this disthe object of pro- case in the testicle of so young a subject. Mr. Lawrence was consulted. The point to the size of a horse-bean, was beteeted bebe decided upon was, whether the disease a
hould at once be removed, or whether a
free opening should be made into the tumour daily increased, and acquired the magmour, in order to ascertain its structure,
nitude and figure of an apple. It felt soft before proceeding to the operation of cas- and pulpy; but when pressed upon, pain tration. The latter method was pursued, was not evinced, and there were no signs of an incision was made, and the tumour was cerebral affection. The health of the hild found to be of a medullary structure, and, began to decline; the digestive organs beconsequently, of a nature requiring innue-came disordered, denoting some visceral diate removal. Mr. Lawrence assisted me affection; the abdomen was tunid, and an in the operation. There was considerable enlargement was, by the touch, felt deeply hemorrhage from the integumental arteries, scated in the abdominal cavity. The patient which rendered it necessary to tie several only lived six months from the time the of them.

The little patient did not experience the least subsequent ill effect from the severe tunnour was seen projecting into the cavity, operation, the ligatures came away, and the from beneath the posterior surface of the wound healed favourably; and in the course of fourteen days the child was sufficiently well to be removed into the country.

On the dissection of the tumour, the following appearances presented themselves :-The tunica vaginalis and albuginea were natural in structure, and there were no greatly thickened. The disease had its ori- signs of disease in the mescuteric glands, gin in the glaud itself. Upon opening the or in the glandula aggregata in the ilcum. tunica vaginalis, a tumour of about the size of a cherry was observed projecting from but those on the left were affected with methe anterior surface of the testis, and cover-dullary sarcoma. The brain was examined. ed by the albuginea, which at this part was On reflecting the pericranium, it was found much attenuated by the progressive absorp- highly vascular in the situation of the left tion caused by the growth of the tumour, parietal bone, and that bone was highly inwhich would shortly have burst into the flamed. tunica vaginalis. On cutting into the morbid growth, it was found to be composed of size with the one just described, on the inlobules of medullary matter, exactly similar ternal surface of the parietal hone, which to fuetal brain, which is termed fungus has had detached the dura mater to the extent matodes. Not a particle of the natural struc- of the arch of the tumour. The arachnoid ture of the testicle could be found, the me-membrane lining the dura mater, and that dullary matter adhered but loosely to the reflected over the pia mater, were slightly tunica albuginea, which presented the ap-thickened where the tumour protruded, pearance of a dense cyst. The spermatic The brain was natural in structure, and chord was perfectly natural in structure.

(Observations .- As I am, from the result the ventricles. of long experience, led to believe that medullary sarcoma, carcinoma, and scrofula, are congenital diseases. I cannot help fearing that the disease in this case will attack some other viscus in the course of time; an occurrence which I have frequently witnessed. Yet there have been cases recorded where the disease was only local, which I sincerely hope will prove to be the fact in this instance.)

Since writing the history of this case, I have been informed by the professional gentleman who attended the patient after its return into the country, of the death of the child: he has also favoured me with an account of the symptoms after the operation, and the morbid appearances which prerented on a post-mortem examination. These I shall briefly relate.

The child appeared to enjoy a good state of health for about four months from the time of the operation being performed. After this period a small tumour, of about protrusion of a part

operation was performed.

Autopsy.-On opening the abdomen, a peritoneum. On reflecting this membrane, the tumour was found to be formed by seveval of the absorbent glands, in the lumbar region, having been converted into medullary tubera. The abdominal viscera were

The lungs on the right side were healthy,

There was a tumour, corresponding in there was not any accumulation of fluid in

The heart was healthy.

The tuniour situated beneath the scalp was presented to me by the gentleman who examined the body. The following are the appearances which were noticed on dissecting the morbid parts. The pericranium, which seemed to form the capsule of the tumour, was highly inflamed, as was the dura mater which contained the corresponding morbid culargement. On making sections of the tumour, it was found to be composed of medullary matter, exactly resembling the testicle I had removed.

The external surface of the parietal bone, where the tumour was situated, as well asthe internal, had been slightly acted on by, the absorbents, but there was no confinuni-1 cation between the tumours, except by the arteries and veins belonging to the cranium and dura mater. On opening a portion

sinus, I found the call

external state, which, in all probability, health before the operation was to be per-vould, the thin child lived a short time formed.

His health did not improve, and the pain out. I am induced to make this pathologous became so distressing that he felt desirous ogical deduction from having a preparation n my museum, where nearly the whole of he longitudinal sinus is obliterated by mehillary matter. The preparation was taken ro a patient who had been afflicted with inputs hamatodes in various viscera.

HISTORY OF A MORBID TESTICLE.

In February 1831, Mr. S-, 30 years of ige, a married man, requested my opinion respecting an enlargement of the right testicle. He informed me that it had been progressively increasing for nearly twelve nonths, and had affected his health, though ac had had the advice of some of the most distinguished surgeons in Lendon. Various means had been adopted to prevent the progress of the disease, which it is not neces-sary to describe, as they had no effect in checking the morbid action. Some of the surgeons advised him, as the only chance of saving his li.e, to submit to custration, which the patient at that time did not wish.

When he consulted me the testicle was of an immense size, and felt very dense and ponderous. There was considerable eulargement of the sperimatic cord; the interminants of the scroting were of a reddish cubair, and the veins were greatly distended and tortnous, and meandered over its surface similar to what I have generally noticed in examining fungoid tumours. The inguinal glands were not affected.

Lecches were ordered to be applied freand externally, and his digestive organs were well attended to. This plan of treatment, with little variation, was adopted for several months, without producing any good effect. The spermatic cord became greatly distended, and there were all the appearances denoting hydrocele. Paracentesis | was performed; the fluid exactly resembled that of a hydrocele in the tunica vaginalis. This operation lessened the distention, as well as the pain which he had experienced; but the fluid soon accumulated again, and the operation was obliged to be repeated a great number of times. A seton was intro-duced into the scrotum, which occasioned a profuse discharge; this was continued for some time, but as it did not appear to alter the morbid growth of the testicle, it was discontinued. As the health of the patient began to decline, and he had a sallow complexion, it now became a question whether

to submit to the removal. Sir Astley Cooper was consulted, and his opinion was, that castration should be performed as soon as possible, with a hope of saving the life of the patient.

I performed the operation on the 23rd of April, 1833. The ligatures separated in about a fortnight, and the wound healed favourably.

The patient at this time. November 23rd, 1835, appears to be in good health, and says that he is, in every respect, as vigorous as

Appearances of the Testis and Spermatic Chord .- A pipe was placed into the spermatic artery, and the parts were injected with size and vermilion. On dissecting the spermatic chord, there were seen several large serous cysts, not hydatids. On cutting open these cysts their internal surface was found to be minutely injected, which accounts for the rapid secretion of fluid which so frequently took place. The spermatic artery was very large, and the vas deferens was pervious from its origin at the epididymis. The tunica vaginalis and albuginea were greatly thickened by chronic inflammation, &c., and they were firmly adherent. A section was made of the morbid testis; there were no signs of the natural structure, and there was scarcely any appearance of vascularity. The morbid productions were composed of scrofulous tumours, which occupied the principal porquently; iodine was employed internally tion of the internal part of what had been the natural structure of the testicle. The external surface had all the characteristic signs of carcinoma; and exactly resembled some preparations of scirrhous testicles which I have in my museum.

Observations .- As the morbid structure of carcinoma, medullary sarcoma, &c. &c., and their devastating effects on the constitution, have been so ably described by distinguished pathologists, it would appear almost needless to publish any more on this subject, except with a view to detailing the minute anatomy which tends to elucidate the cause of those morbid changes, and the tissues which they affect, and this I hope will shortly be satisfactorily given by my friend Mr. Kiernan.

My motive for wishing to publish these two cases is, to show, in the first case, the early development of the disease,—its occurrence in a child, which appeared to be, it would be right to propose the removal of otherwise, in perfect health,—and to point the festicle. At this time Mr. Earle saw out the singular circumstance of its affecte setient, and his opinion was, from the ling so many other parts of the body, so soon after the operation,—a fact which proves what I have frequently asserted, viz. that and that it would be malignant diseases and scrofula are con-

The second case is only interesting in one | considerable importance. part of its pathology, and that relates to the combination of scrofula with carcinoma. This is a rare occurrence, and one which I should term accidental. I have inspected the bodies of a number of patients who have died from the effects of medullary sarcoma, and only in one instance did I find any sign of scrofulous tubercles, and they were in the lungs, and of the miliary kind.

I have seen such unfavourable results after operating for cancerous or fungoid affections, that I have determined never to propose an operation, or again to perform one, in either disease, unless at the particular desire of the patient, and with his consent to abide by the consequences, without reproach against the surgeon.

ON THE

LAW OF MORTALITY

1 N

EACH COUNTY OF ENGLAND.

By T. R. EDMONDS, Esq., B.A., of Trinity College, Cambridge.

(Concluded from page 371.)

In exhibiting the law of mortality of the aggregate population of England, I have gone to the full extent allowed by the materials, and compared the mortality in each of thirteen gradations of age. A comparison consecutive in ervals, which is a point of been concentrated on #

inple, if two consecutive results, the the inter-10 per cent., and other two consecutive results, when the intervals are larger, differ by the amount of 30 per cent., a much greater number of facts will be requisite for determining the approximate value of the smaller than that of the larger difference. Fourersons of this nature, in comparing together the mortality of different counties, I have extended the intervals, and reduced the thirteen to five gradations of age. I consider that the numbers thus obtained are of nearly equal weight with the numbers obtained for the aggregate population in smaller intervals of age. No useful information has been lost by this proceeding, for I have taken care to draw the lines of division in such a manner as to include the parts most nearly allied to each other. To prevent the possibility of any mistake on this head, I have obtained for nearly all the counties of England, the resulting mortality for each of the thirteen gradations of age. As I have not met with one instance of a decided variation from the scale of relative mortality already exhibited for the aggregate population, there appears to be no reason for desiring the publication of the results for smaller intervals of age than those which I have adopted,

In closifying the different counties of England, I have arranged them principally according to the rate of mortality of females between the ages of fifteen and sixty years. to the same extent might have been insti- But I have not separated counties in juxtatuted for each county, but the results would mosition, when the difference in the rates of have been less valuable, being founded upon more dity was inconsiderable. The mortality observations of very inferior magnitude, of males at the same interval of age would According to the doctrine of chances, the not serve us a good index to the healthfulsmaller the number of facts, the less correct ness of a locality, unless we could abstract is the indication of the general law which the detrinearal effect of their occupations, these facts obey. When the intervals of leading to fatal accidents, or to loss of health. age are very small, and when the differences In many counties, also, the uncertain amount between the mortality at consecutive interpolation of the military and maritime population, divals are also small, the true law of neortality minishes considerably the value of the apis never correctly indicated, unless the facts purent mortality of the male sex. Another observed are of immense magnitude. During valuable classification might be made, groundonfancy, the nortality at one annual inter- ed on the nortality under the age of lifteen val differs 32 per cent from the mortality years, but much preliminary labour would of the succeeding annual interval; and on he requisite, in order to abstract the influaccount of this great difference, a small ence of large towns. For example, the account number of observed facts are sufficient to tality in Devon, under the age of five years, determine the true law at this period. But is nearly 25 per cent, greater than in Combetween the ages of fifteen and fifty-five wall, and yet it is doubtful whether the cliyears, the mortality at any annual interval mate of Devon is less favourable to infant differs only one-thirtieth part from the mortality of the next annual interval; and we part of the excess may be accounted for by cannot expect to find any materials of sufficient amplitude to indicate correctly these large town like Plymouth, the mortalicy of menute differences. By extending the intervals of age observed, we increase the
weight by diminishing the number of the
fresults. We also thus increase the diffreences between the mortality at two
consequities interests, which is a noint of
here concentrated on

Table point for each County of England the Annual Deaths which occur for every Hamiltonia in each of Five Gradutions of Age, the Counties being Classified according to Mortality of Females between the Ages of Fifteen and Sixty Years.

their Commencing the morns my in thirty-nine countries have been obtained by increasing the contribution of the case of Wales, Monnouth, Middiesers, and Surrey, the increase earliest of the Monnouth, Middiesers, and Surrey, the increase earliest of the Monnouth, Middiesers, and Surrey, the increase earliest of the Monnouth of the funder population of each country.

The general harmony of the results in the though inferior disposition in foregoing table, appears to be interrupted in derstate their ages. In the two instances only. In the counties of Dur- have thought it preferable ham and Kent, the mortality of males between fifteen and thirty years of age is considerably higher than would be expected. In Durham, the excess may be due to accimaritime population. The extremely low county of Warwick is a deceptive appear- largest correction. had been included in the general summary of the county, the proportion living above sixty would have been considerably less, and consequently the true mortality would have been considerably higher than the apparent. A deceptive appearance of a similar nature, though inferior in degree, exists in the counties of Gloucester and Northumberland, in consequence of the omission in the county summaries of the ages of the inhabitants of Bristol and Newcastle.

One of the most remarkable and unexpected results presented by the above table, is the fact that the mortality of females between the ages of fifteen and sixty years is greater than that of males at the same period in all cases excepting Cornwall, Devon, and Wales. The difference would be still because they are subject to laws of mortality sible error, in comparing together the mor- and Cornwall, the mortality during the tality of the two sexes, is to be diminished years after birth, differs very by the compensating effect of a similar mortality in many count

able I the : pparent mortality of males between streen and sixty years of age, without a necessary correction for the unenumerated military and maritime population. It may, howdents in mines; in Kent the excess may be ever, be acceptable to state the two classes due to deaths of boatmen, or to the omission of counties in which the defects are must of an excessive proportion of military and considerable. Kent, Surrey, Middlesex, Durham, Cumberland, Northumberland, North mortality above the age of sixty years in the York, East York, and Devon, require the Lancashire, Wales, ance consequent on the omission of the ages Gloucester, Cornwall, Norfolk, Essex, Dorof the population of Birmingham, which set, and Southampton, require a smaller constitutes one-third part of the population correction. The apparent results for males of the entire county. The proportion of from fifteen to thirty, and from thirty to living above the age of sixty years is much sixty, ought probably to be diminished by less in large towns than in the country. If the quantity .09 in the first mentioned the ages of the inhabitants of Birmingham counties, and by .05 in those last mentioned, the reduction for all England being about .06 at each of these two periods.

In the case of Cornwall, Devon, and Wales, there appears to be some ground for the conjecture, that the relatively high mortality of the male to the female sex, arises from original peculiarity in the constitution of the inhabitants. The proportion of male to female births in these districts, differs very much from the proportion existing in the rest of the observed territory. In these districts also, the mean age at which females attain the minimum mortality, is the same as that for males; whilst in other districts, the minimum is generally attained one year carlier by females than by males. During the twenty years ending with 1830, for every 100 births of females, there were greater, if allowance were made for deaths born of males, 110 in Wales, 108 in Devon, by accident, which are more numerous and 107 in Cornwall, whilst in the whole of among males than among females. In Corn- England and Wales, the excess was only 44 wall and Wales, the apparent exception may per cent. In Middlesex and Surrey, the be due to accidents in mining. In Devon excess of male births was only 14 per cent.; the apparent exception may be due to deaths but this affords no ground for inferring that in naval and military hospitals, and to a the proportion of conceptions of males was very high proportion of unenumerated sai- less in London than in the country at large. lors and soldiers. The counties of Middlesex | The mortality in infancy is much greater in and Surrey are excluded from comparison, large towns than in the country; and it is very probable that the mortality of males peculiar to large towns. I have already before birth, exceeds the mortality of festated my reasons for believing that very males before birth, according to the same 4 little error can have arisen from the under- law as exists for the first five yearsoafter statement of the ages of females. The pos-birth. But in the case of Wales, Devot.

justly conclude, that the morthat the excess of male conceptions is considerably greater in Wales, Cornwall, and Devon, than in the rest of the territory.

The relative mortality of the male to the temale sex, between the ages of fifteen and sixty years of age, appears to be dependent on the mean age at which the period of "infancy" terminates. In nearly all the counties, this period for males terminates at the age of eight years, which is indicated by the fact, that the mortality between five and ten is 50 per cent. greater than the mortality between ten and fifteen years of age. In the majority of counties, this period for females terminates at seven years, as is indicated by the fact, that the mortality at the former exceeds that at the latter interval only 20 per cent. Cornwall, Devon, Wales, and London, are the exceptions to this general rule, the mean terminating age for females being at eight years or above. In these four districts, the relative mortality of males to females is just the reverse of what exists in the rest of the observed territory. The general law appears to be, that when the minimum is attained by both sexes at the same age, the mortality of males exceeds that of females; and that when the minimum is attained half a year sooner by females than by males, the mortality of the two sexes between the ages of fifteen and sixty years of age is equal.

In adopting the mortality between the ages of fifteen and sixty years, as an index to the healthfulness of a locality, I have been influenced by political as well as numerical considerations. The strength of any nation resides in the individuals comprehended in this interval of age. A low degree of mortality at this interval contributes greatly to the physical, but more especially to the moral, strength of a nation. A low degree of mortality in infancy does not necessarily add to the strength of a nation, because it frequently involves a high mortality at the period when life is most valuable. Comparing together two "stationary" populations haveg each the same number living between fifteen and sixty years, the stronger and more thy inthat containing the smaller number her the age of fifteen years. If,

the is only half as great. We show the age of sixty years, is as much a source of weakness as the population under the age of fifteen, then the physical force of any given amount of population, is independent of the law of mortality; at least the highest and the lowest laws of mortality which have been supposed to exist, yield the same proportion of living between the ages of fifteen and sixty years, out of a given number living at all ages. The highest law of mortality I suppose to be represented by the ancient tables for London and Stock bolm; the lowest law by Dr. Heysham's observations at Carlisle, on the supposition that there were no deficiencies in the registered deaths.

It is a remarkable fact, that all the counties of England in which the mortality of females between the ages of fifteen and thirty is at a maximum, are situated on or near the same straight line; and that in the counties most distant from this line, the mortality is at a minimum, the maximum being to the minimum in the proportion of three to two nearly. This line is a central one running in a north-west direction from Brighton to Liverpool. In Northumberland and Cornwall, the two counties most distant from each other and from this line, the mortality is at the minimum. Sussex has been supposed to be one of the most healthy counties of England, and the mortality under the age of five years is as low in this as in any county. Nevertheless it obeys the law common to other counties on the central line, and suffers the maximum mortality between the ages of fifteen and thirty years. Possibly the apparent high salubrity of Cornwall, Devon, and Wales, may be the effect of their peculiar geological and geographical position. They are situated on primitive rocks containing no organic remains, and they are most exposed to the sea air.

In the preceding table the different counties have been classified, and the mortality has been stated for each county at five intervals of age. I now present a second table. which shows the mortality at six intervals of age, resulting from combining the counties comprehended in each of the eight classes. I also present the whole of the materials from which the mortality of those classes, or combinations of counties, has been deduced, in order that every reader may possess the means of verifying with ease the results exhibited. Any person possessing copies of the population returns of 1821 and 1831, may verify with equal facility the results exhibited for single counties. In the table for the separate counties, on account of the insufficient magnitude of the observations, the mortality between the ages of five and ten, was not distinguished from the mortality between ten and fifteen years of med that the population age, as it is in the following table.

* The apparent mortality of the male sex between 15 and 30, between 30 and 60, and at all ages, has been diminished by .06 in the total, and in classes 1, 2, and 3; it has been diminished by .03 in classes 4, 5, 6, and 7; and by .10 in the eighth class.

ferent ages is founded upon the deeths at each interval of age, by using, as a common specified ages occurring during the eighteen multiplier, the number which will reduce years 1813-30, whilst the absolute annual the mortality of the aggregate to the nummortality is founded on the deaths occurring ber previously obtained, representing the during the twenty years 1811-30. The absolute annual mortality at all ages, difference between the mortality for the In the eight classes of counties, the aseighteen and for the twenty years is insigni-ficant; in the former case, for the whole of the ages of fifteen and thirty years, are not so England and Wales, it was for the female well marked among males as among females, sex, 2.064 per cent. per annum; in the lat- Nevertheless the difference between the ter case it was 2.061. It would have served maximum and minimum is nearly the same no useful purpose to have undertaken the for each sex. In the first, or most healthy labour of separating the deaths of the two class, the annual mortality of females beyears 1811 and 12, and the difficulty to the tween the ages of fifteen and thirty is seven reader in verifying my results would have out of one thousand living; in the seventh, been unnecessarily increased. For similar or most unhealthy class, it is 10.3 out of a reasons I have also omitted to complicate thousand. In the same classes, at the same the question, by introducing a trifling correction consequent on the assumed mean out of one thousand living. On inspection rection consequent on the assumed mean out of the above table it will be seen, that the mortality of females between the ages of fifteen and thirty most exceeds the mortality of males at the same age, when the nt may be useful to give an example of the large of mines at the same age, when the mode of obtaining the number representing inortality of females between five and ten differ least from the mortality of females class, the registered deaths of females are between ten and fifteen years. From the stated to amount to 116,797, which increased one-minth part for unregistered of the part of th

In the above table the mortality at dif-| made to represent the absolute mortality at

deaths, and divided by 20, yields 64,887, as constant in all classes, especially among the average annual deaths. This number males. This result is not much to be relied divided by 363,441, representing the mean upon, because the variations to be looked number living during the period of obser- for are very small, and as such might be vation, gives the quotient 1.78, which is the concealed by the population above the age ion, gives the quotient 1.78, which is the conceased by the population above the age
ber stated as representing the absolute of airty years, not being exactly distributed
from dividing the deaths ites. There exists, however, a distinct
the living at the same ground for the belief that the mortality
aumbers are then above the age of sixty years is nearly con-

cant. In nearly all the counties of England mum mortality, or that existing between the number living in 1821 between the ages of ten and fifteen the second of sixty and seventy was to the number living between the ages of seventy and living between the ages of seventy and the country. The absolute mortality stated for these towns the country in the more view of the country. eighty years, in the proportion of two to one is founded on the assumption that the reginnearly, which coincides with the result of tored deaths are to be increased 20 per cent the table of "Mean Mortality," on the in order to obtain the true number of deaths; in the whole of England and Walt. tionary. I have already stated my reasons for the belief that this was the case, and that the living between seventy and eighty were the survivors of the same number of births as the living between sixty and seventy / years of age.

The population returns furnish the materials for determining the law of mortality in six towns only, which are of the largest size, and principally seaports. On account of the omission in the enumeration of the maritime and military population, we cannot determine the degree in which the mortality of males exceeds that of females between the ages of fifteen and sixty years. It is, however, indisputable that in all these The scale of relation connecting together and smaller proportion of the inhabitants of the mortality at different ages in large towns differs from the scale for counties chiefly in exhibiting a high ratio of mortality in infancy and in old age; the mini-

the estimated increase has been 13.92 per cent. In large towns the mortality between five and ten, is to the mortality between ten and fifteen as two to one nearly, which indicates that the mean age of attaining the minimum mortality is at nine years; for all England and Wales the minimum is attained at the age of 71 years. This fact, which is established on the firmest ground, as it depends on the correctness of the relative and not of the absolute numbers returned, seems to contradict the commonly entertained opinion, that the epoch of puberty occurs at an carlier age in towns than in the country. It is, however, difficult to believe that such an opinion can have any sound foundatowns the mortality of males considerably tion; for it can hardly be disputed that the exceeds that of females at every age. In all general population of large towns suffer the property of the state o England and Wales the mortality of males greater privations of food and air, than do above the age of sixty years, exceeds that the inhabitants of the country. Perhaps of females by three per cent. only; in the the erroneous opinion may have been six large towns the excess is 14 per cent. founded on observations of the wealthier

The mode of distribution according to the | The great disproportion in this last class age of the population living in 1821 is a between the numbers living between five present inquiry. I have therefore constructed a table representing the number of females living in London between fifty age, in each of the eight classes of counties, rounding country. It would be difficult; and in each of the six towns, out of one give a correct and useful view of the thousand living st all ages. This table in- ner in which the male population dicates that the mode of distribution of the buted, because we are in living is nearly the same in all classes ex- ber and ages of the min cept the eighth, which represents London, population attached to English, whether at

question of considerable importance in the and fifteen, and between fifteen and thirty years of age, shows that one third of the females living in each of five gradations of and thirty are immigrants from the mig

home abroad. Mr. Rickman, in the cated by this and by other principles. For aturns of 1821, has given a very terms of 1921, nas given a very population. He omits entirely all the maritime and military population, and consequently exhibits an excessive proportion of males under fifteen and above sixty years of

comparing together two districts wherein the population is stationary, the higher proportion of survivors above the age of sixty years, will indicate the exist-ence of a lower degree of mortality. When the population of the two districts suffers the same rate of increase or decrease, the higher proportion of survivors will equally well indicate the lower degree of mortality. Upon a principle of this nature I have instituted a comparison in the different classes I have added a column in the following according to this theoretical table agrees table to represent the proportion of survivers above sixty for every one hundred living between thirty and sixty. There is a general England in 1821. ral agreement between the mortality indi-

example, the annual mortality of females in the first class above the age of sixty is 7.14, and in class eight it is 9.95 per cent. In the first class the living above sixty amount to 31.6 for every one hundred living between thirty and sixty; whilst in class eight the survivors amount to only nineteen out of a hundred. The few existing discrepancies are such as might be expected to arise from occasional differences in the rate of increase of the populations compared. I have also given the results of my table of "Mean Mortality," founded upon the assumption that the population had been increasing 10 per cent. at each decennial interval under the age of fifty years, and had been stationary above that age. It has also been assumed that the age at which the minimum of counties, and in towns, between the mortality has been attained is seven years, number living above sixty, and the number which corresponds with the fact for females living between thirty and sixty years of age. in all England. The resulting distribution

The greatly diminished mortality of in- living individual; of which the immediate fants in England is probably the consequence of the rapid increase of the population during the last sixty years. There are only two principal causes which operate in producing an increase of population; and either of these would appear adequate to ccount for a diminished mortality in in-

and temporary effect is, a reduction in the mortality at every age. The second cause which determines an increase of population is, the exercise, at an earlier period, of the reproductive power, which is the only way that an increase of population can be obtained when the proportion of food to each and an increased mortality between individual remains constant. I believe that the fact will not be disputed, that the desupply of food to each velopment of animate and inanimate life is

accelerated by a plentiful supply of food; years, which it is at present. and I believe that it will no more be disputed, that as the rapidity of development increases, the soundness and degree of consolidation of the mature individual diminishes. Whether a diminution of the mean age of contracting marriages causes a more rapid development of the new population, is more a matter of conjecture, as the facts bearing on the subject are yet very deficient. It appears, however, highly prohable that the children of parents who have exercised the power of reproduction at an early age, will be sooner able to propagate than the children of those who have exercised this power at a more advanced age. The germs of animals may reasonably be supposed to obey laws similar to those re gulating other constituent parts of adult individuals. I believe it to be admitted by physiologists, that the proportion of new matter secreted, and of old matter absorbed. diminishes as the age of the adult individual increases. That is to say, the elements of law of mortality which existed in England the members of young individuals are in a state of greater activity, or impressed with derably less than in Belgium; at all ages more motion, than those of older individuals, above fifteen years it is as much greater. It may hence be inferred that the germs detached at an early age, containing elements in a higher state of activity, will have a tendency to more rapid development than the germs detached from the same individual at a more advanced age.

The English population returns, however, supply no evidence as to the epoch of puberty; they only show that the minimum mortality is now attained one or two years earlier than it is supposed to have been attained in any other European country. This is, however, a sufficient ground for presuming that the new population undergoes a more rapid development than that undergone by the population of other countries; which presumption is corroborated by a corresponding increase in the mortality between fifteen and sixty years of age. In every county of England, the mortality between the ages of fifteen and thirty years bears a higher proportion to the mortality between thirty and sixty years of age than it ought to do according to the Swedish observations, or according to the new theory of mortality. This apparent contradiction becomes a confirmation of the new theory, if it be admitted that the English population is now in a state of transition, and that the limiting age of "infancy" fifty years ago was at nine years instead of at seven and a half

admitted that the contracti of lafancy indicates a more ment, and a consequent dimit solidation in the new population. viation from the theory in England now is just what might be expected to occur, on the supposition of the rising adult population possessing a lower degree of vitalital

than their immediate predecessors.

The population of Belgium is apparently also in a state of transition from a low to a high mortality between the ages of fifteen and sixty years. The limiting age of infancy is now at eight and a quarter years, having previously been probably at nine years, as in other European countries. The Belgic observations exhibit the same "plague snot" as the English observations, in the high relative mortality between the ages of twenty and thirty years. The only difference between the population of the two countries appears to be, that the state of transition has endured twenty years longer in England than in Belgium. It is not improbable that the law of mortality in Belgium, at the present day, coincides with the twenty years ago. Under the age of ten years the mortality in England is consi-

It might be denied that the proportion of food to each individual of the English population has been increased during the last sixty years, because the wages of labour, measured in wheat, has not been increased during that period. This objection is of no weight, because the mode of subsistence of the labouring population has experienced a great change, potatoes having constituted one of the principal articles of diet. Assuming that four pounds of potatoes are equivalent in nourishing power to one pound of wheat, and that six pounds of potatoes are generally sold for the same price as one pound of wheat, each labourer will have his command of food increased fifty per cent. In London, and probably in all very large towns, one pound of wheat is seldom exchangeable for more than three pounds of potatoes; consequently the labourer can obtain no increase of nourishment by expending his wages on potatoes instead of on wheat, and cannot satisfy his hunger with coarse food when the supply of plain food fails him. In small towns, but more especially in villages, a great increase of food is generally obtained by the substitution of potatoes for wheat. This difference in the relative value of wheat and potatoes, by causing a different degree of privation, may be the reason why the minimum mortality is attained one year later in large towns than in the country

46, Regent-square, Dec. 1835.

.....

London, Selunday, December 12, 1835.

Ir has been ordained by the Crown that arliament shall assemble for the dispatch In less, therefore, than two ionths from the present time, the Poor-Law |edical-Contract system, as it has been inctioned and enforced by the Government ommissioners, may become the subject of scussion in the Houses of the Legislature. broughout the profession it is agreed, ithout, apparently, a dissentient voice, that othing can be more odious, impolitic, and ony-hearted, than the existing arrangetents. Every where it is seen, felt, and eknowledged, that the contracts with which reident medical practitioners are forced to omply, as alternatives which are preferable the introduction amongst them of a host f vicarions, mercenary, and unfeeling adenturers, are calculated not only to inflict pon the suffering poor a vast aggravation t their miseries, but to excite in the minds f the immense body of hale English laourcrs, such feelings as no wise governnent would deem it rational to cherish.

The system, consequently, calls for instanancons abolition. But the Commissioners and l'arliament may very justly ask, "What s the plan which is to be sanctioned as a substitute?" and the Commissioners may

以2000年1月1日。2000年1月**2**0年

it he thought that the discretionary power which is now exercised by the Poor-Law Commissioners should be abrogated, and that the supreme executive authority, in arranging all matters connected with medical contracts, should be invested in the Board of Guardians -if, also, it be deemed an obbusiness on Thursday the 4th day of ject of humane and necessary precaution. that a minimum rate of charge for the exercise of medical skill, and the supply of medicines to the sick poor, should be adopted. below which the mercenary and brow-beating jobbers should not be enabled to depress the interests of their victims, it will be necessary that a Bill should be introduced into Parliament for altering so much of the Poor-Law-Amendment Act, as relates to the medical treatment of the necessitous poor.

What, then, ought to be the scale of charges?-What ought to be the minimum of charge?-Under what conditions should the Board of Guardians exercise their executive medical functions ? -- These questions are at this moment of great importance, and on the share of attention which may be bestowed on them may depend, in a great measure, the lives of some thousands of the people of this country. Within a few weeks it will be necessary that a plan which is sauctioned by medical practitioners themselves, for placing the medical contract system in the Unions on a just and secure basis, should be placed before the legislature. We are anxious, therefore, that not a moment should be lost in considering the illege that it is not altogether fair to inflict | question, with a view to accomplishing a pracupon them so much censure, and raise up tical permanent improvement; and whatagainst them such a host of enemics, unless ever may be the views of our professional we prove that a better system can be adopted | brethren on this subject, we hope that they than the one which they have sanctioued. will be induced to communicate them to us, To this point, therefore, we are anxious to whether for publication in the pages of this invite the immediate attention of medical journal, or in the form of suggestions, to be practitioners. Where the Unions exist, the employed with effect within the walls of Fresca lan is in operation. Its permicious Parliament. Quite evident is it that the horse san there observable. These should cause of the suffering poor, and of the prorecliated, and the means of sub- fession, will make but a sorry exhibition in verting them state adoption of some other the House of Commons, unless some almost plan, should be straigly considered. If unobjectionable plan can be substituted for

the system which is now carried into operation by the Poor-Law Commissioners. widely diffused, before the diameter receive

What, therefore, is the scheme which medical practitioners would recommend?

In determining to found a national University in this metropolis, the Ministers of the Crown have taken a bold step, but it is, nevertheless, one which is in perfect keeping with the liberal measures which they produced and supported in the last session of Parliament. We cannot, however, avoid expressing our regret that it is intended to grant degrees in medicine in the new institution, and this feeling, which so strongly influences our minds, is shared, we find, by the great majority of our professional brethren. We have already in England alone, six bodies which are empowered to grant diplomas, licenses, or degrees, in medicine and surgery. It is unwise, therefore, to add to the number of those mischief-making or mystifying institutions in medicine, until, at any rate, the profession have had an opportunity of inspecting the report which is yet to be made by the Medical Committee of the House of Commons, of which Mr. WARBURTON is the able chairman.

We have not space to devote to this subject in the present number of our journal, but we may observe, en passant, that at a meeting of the Council of the London College of Medicine, it has been resolved to present a petition to the Crown, praying that no alteration may be made with reference to medical statutes or titles, until the Committee of the House of Commons has finished its labours; and, further, that in founding a new University, no monopoly may be created in favour of any particular institutions.

We cannot avoid remarking that the foundation of a new University in the metropolie of the empire is a proceeding pregnant with so many important considerations, that copies of the document which is to be framed for its government, ought to be generally and

the sign-manual of the Had R draf of the charter of the College of Surgeons, in the year 1800, been laid before the public at that time, is it possible that so detestable an instrument could ever have received the sanction of the Ministers of the Crown There can be no reason why the drafts o charters ought not to receive as much pub licity as bills which are introduced into th House of Commons. It is to be hoped therefore, on every account, that the draf of the proposed charter will be laid befor the public, so soon as the terms of its ar rangement are agreed upon by his Majesty' Ministers and the Members of the Priv Council.

On the 19th ultimo the following notic was issued from the Dublin College of Sur geons:—

"Dublin, 19th Nov. 1835.
"The Royal College of Surgeons in Irc land will hold a special meeting on Monda next, at two o'clock, to receive Mr. Kirby' resignation of the Professorship of the Theor and Practice of Physic. By order, "C. O'Kcefe, Dr."

Thus terminates, in disgrace and disarpointment, a job that was conceived in th worst spirit of corruption, and carried int effect by means which cannot be safel described. May all such execrable inva sions of the rights of the medical profes sion end in a similar manner, and may such be the just requital of all those who barte the gem of peace and integrity for the flect ing baubles of selfish and disreputable am bition. Mr. KIRBY cannot, we presume, b much surprised at finding his fate the sub ject of these aspirations, nor expect that th event of his Improper connection with the College of Surgeons would excite in his be half the slightest commiseration amongs his professional brethren. He waked in the "house of sin" with his every His commerce with its let was an act of free-will it sideration. He had a

Acres and the Commence

he moral n o have the consequences to his intended to destroy, is, we understand, more eputation of holding communion with hem. He had not even the temptations to which prudence would consider it worth vhill to sacrifice the better feelings of hunan nature, and the certain results of the exercise of such abilities and information as te poss; ssed. A professorship of the pracice of physic in the College of Surgeons was it no time of much pecuniary value, and at he moment he accepted it the prospects of ts becoming worth still less, were more obious. The science of medicine had been so evolutionized in character, and so enlarged n extent, that no man in Dublin, of Mr. CIRRY's standing, nor any one who was eduated in the principles of the by-gone school of physic, could expect to discharge the duties of such a professorship with success; while, o ensure the failure of such a speculation, here were arising in Dublin many young nen of talent, who were instructed in, and were about to establish, the doctrines of the new school. It was not, therefore, worth Mr. KIRBY's while to accept, under any circumstances, a paltry promotion, the profits of which he might have seen would be daily liminishing by a competition which he was out indifferently prepared to oppose. It is, nowever, but justice to him to believe that he was the least criminal, though the most inared party, in this diegraceful transaction. He certainly was not the crafty unprincipled lraftsman of a design which elaborately calrulated the advantages, while it insured the ruin, of a rival, under the pretence of conferring an honour and rendering him a service. He was but the weak, improvident, consenting, instrument in a plotagainst the privileges and property of a whole body of private in-

gs of the place, and ought | establishment which his appointment was prosperous this year than at any period of its former history. The humiliation of lecturing before a class of this compass, to a man who, in other days, was accustomed " his little senate to command," was the real cause of Mr. Kinny's retirement, and not a "fit of the gout," as he would have his contemporaries and the public to believe. It was, in fact, the class of the College School which took the gout; and if we are not very wrong in our conjecture, the disease will, in a short time, become general in other departments of the same establishment. Mr. KIRBY has thus been made, by an imprudent and unjustifiable compact with a corrupt body, to quit, at the most active time of life, the busy scene, and to seek in the retirement of private life, the reparation of his once brilliant reputation. This case may be a warning to those who would follow in his footsteps. From his career, the dupe or the knave who fancies he tricks, or is tricked by, a faction, may learn this lesson, that vices operate like age; they bring on discase before its time, and in the prime of manhood disclose a character, broken and exhausted.

But the render will naturally inquire "What was the conduct of the College, " and of the individuals in particular, by " whom Mr. KIRRY's sacrifice was accom-" plished?" Did they evince any compunction for the injustice which they committed on Mr. Kinny, and through him on the profession? Did they even observe the dictates of decency in covering the shame and discomfiture of their victim, by passing a worthless vote of thanks, or, by any other consoling expression, approve of the condividuals, which none but the most selfish duct of a retiring officer who had suffered could conceive, or the most insensible to intheir service? No; Mr. KIRRY's labours character could have executed. Both par- as a teacher, his favours as a patron, and der have, however, had their reward. Mr. his advocacy as a politician in the College alled to retire from a national | School, were not considered, on the occasion ill only procure for him | of his resignation, as worth even a resolution sesson; while the declaratory of the approbation of that virRESERVE A STORY

tuous and grateful Institution. The snnouncement of his retirement was, we understand, received by his colleagues with all that heartless judifference with which the practised seducer would hear of the miseries of his victim. The common tribute of respect which might be conferred on a porter or a clerk of the establishment-a vote of thanks - was withheld from Mr KIRBY! Far different were the motives by which they appear to have been actuated; other objects, of more moment than thanks to Mr. Kirsy, were occupying their thoughts. "Let the dead bury the dead," seems to have been the rule acted on by them with the most literal fidelity of interpretation and malignity. The provision of a successor out of his extinction-the conjuring up a new phoenix out of the ashes of the departed, to shed a temporary lustre on the school in Stephen's-green, was a much more important matter than a vote of thanks and idle regrets; and to this point they immediately applied themselves on the occasion. The account which we last week promised to give, from a correspondent, of the proceedings, we must again postpone for a week.

In recommending, last week, the paper of Mr. EDMONDS to the attention of the profession, as a document containing information respecting many important facts relative to which great secrecy was observed by those few persons who are qualified to form correct conclusions on the subject, the author thinks that some misapprehension may occur, which he requests us to prevent by stating, " that the universal silence which " has been observed respecting materials "which have been twelve months before " the public, admits of a more satisfactory "explanation. Nearly every writer whose " opinions upon the subject are of any va-" lue, has fallen into the error of conclud-" ing, that because the annual mortality of " the English nation, at all ages, has been "the English nation, at all ages, has been rently is, to admit personal diminished from one in thirty-eight to cone in forty-eight, therefore the mortality a previous course of the control of the course of the co

" at every age of life has been diminished." The present new material chow, that the mortality of persons above the ages of fifteen years has suffered no diminution; the mortality of infants alone having been diminished. It may not, therefore, be " reasonable to expect, that writers orgmor-"tality will assist to disseminate newlypresented facts, which are contradictory of their previously-expressed opinions. "The concluding portion of Mr. Ep-MONDS's article will be found at page 407 of this week's LANCET.

METROPOLITAN UNIVERSITY DEGREES.

To the Editor of THE LANCET.

SIR,-Being at present a student at Kino's College, and intending at some future period to present myself before the examiners of the university about to be founded, as a candidate for a degree in medicine, I consider myself to be partially interested in the question which has been descanted on in the article at page 389 of THE LANGET, to which my letter is intended as a reply, viz., Should residence for a given period in an university, and conformity to a prescribed course of study, be required to render a person eligible to graduate in the University of

But before proceeding farther I must premise, that although I am aware that you yourself advocate the principles which your correspondent has laid down, yet I am not deterred from writing, through any fear that my communication will be rejected solely because it is opposed to your opinions. No. Sir, I have long been a reader of THE LANCET, and never do I remember having seen an instance of illiberality on your part. I therefore forward this to you, relying on your known candour for its insertion, as much as if I knew that you cordially agreed with the opinions expressed in it. Neither indeed (considering it as a matter of policy) would it be wise to confine the columns of a scientific journal to the use of one party; for its reading being confined to men of a liberal education, who are accustomed to judge for themselves on every subject, and unbiassed in their sentiments, they never form a decided opinion on any point without weighing well all the arguments, pro and contra. With such readers, the cofore, no object can be attained by refusing free discussion on any matter.

The object of your correspondent annual is, to admit persons as a can them to merely on

he strongen as a certificate of good moral | very little; and there are also many matcharacter. When the proposition that a ters of general information connected with certificate required, I most cor-bially agreement comportant alteration the lecture, and of his knowledge of which ought to be made in the manner of obtaining it, for the deplorable facility with which certificates are now given is well known. Indeed. I have no doubt that they are frequently forged. What I now proceed to prove is, that although the scheme of allowing young men who are designed for a profession to obtain their education where and how they choose, might be better for a very few individuals, it would be almost ruin to the great majority. At present, when students, from a fear of being refused their certificates, are compelled to attend lectures occasionally, how many are there, let me ask, who never show themselves in a lecture-room more than three or four times a week? Perhaps your correspondent will this University. Certainly not, and theresay that they are more profitably employed fore it is so much the more to be approved in pursuing their studies at their own homes; of. All graduates are, at present, as a but this I am afraid will scarcely ever be matter of course, supposed to be gentlefound to be the case. No, I am ashamed men, and to be either of good families, or to say that even under the present laws, a to have received a polished education, fitting great number throw away that time on vice them for the society in which, as graduates, of every description, which ought to be spent in study. But still, owing to the lecture-system, they are compelled occationally to recur to their studies. Now, if these persons were allowed to study in what amination, and without being put to any manner they liked, the consequences clearly expense, being some of farmers, tradesmen, would be dreadful. They would most likely ide, their graduation would detract much be sent by their relatives to London or some from the respectability of graduates as a large town, where, instead of sendying, they body, and though, in a few instances, no one would squander away their money and time could object to persons raising themselves in the pursuit of dissipation, always patting from the lower classes by their talent, still, off the period of study until having entirely as a general thing, it cannot be too much ruled themselves in fortune and health, deprecated. they have disgusted their friends, and, in gradatio!) to apply themselves to trade, and close. I have not, I hope, said any thing perhaps linger out the remainder of their miserable and degraded existence in the is a feeble picture of the evils which I am satisfied would in numerous instances result from the misjudged act of leaving young men to chalk out for themselves their mode of study. Students, especially of medicine, are always, partly from inexperience, and partly from had companions, prone to vice, and this measure would. I am afraid, give them more opportunity for it. Such are my objections, treating this in a moral point of view.

Again, I am confident that to a certain extent the oral has a great advantage over the written method of communicating instruction to youth. There are many points connected with the different studies which It would be impossible to treat of fully in books although there is no doubt but that

it would be next to impossible for the examiners to form an idea in an examination of any reasonable duration. Also the weekly examination of the different classes by the several professors, is an advantage of no small importance.

Also let me suggest, that it is unfair to cast imputations on a body of men whose names are not even known, and who are not yet called into I may say political existence, which your correspondent does in hinting that the old method of study has been adopted by them as likely to be more condurive to their own case.

Again, he says that none but the comparatively rich will be able to graduate in

Being fearful of exhausting too much many cases, are compelled ehen quanta de- space, I must now draw this subject to a which can be construed as personally offensive to any one. As to the strength of my employ of some chemist and druggist. Such arguments, as compared with those of my opponent, that must be decided by the public.

I see that in your last number a correspondent would suggest, that the new body be allowed to confer degrees in surgery. Permit me to suggest that if this be carried into effect, a regulation should be made compelling candidates for the degree "chi-rurgiæ baccalaureus" to afford proofs of understanding drawing, as I am of opinion that this knowledge assists the anatomical student greatly. Also, that if a graduate in surgery, or, in fact, if any graduate, wishes to obtain the license of the Apothecaries' Hall, he should be exempt from the regulation which requires an apprenticeship of five years, and should only be obliged to spend one year in dispensing.

Allow me also to draw the attention of

by would benefit him for the support of the mother and sister of

the late Gilbert Burnett, Esq., lastiser on Botany in this institution. They depended entirely on his exertions for their support, and are now in a state of poverty. He was the last male descendant of Bishop Burnett.

I would also propose to the proprietors of King's College, and the University of London, i. e., the institution at present called so, that they should admit two young men annually in each department, giving them free ad-mission to every class until they have completed their studies in the particular pro-fession they make choice of. The objects of election should be young men of good connections, but destitute of the means of placing themselves in a profession, or giving themselves an education which might fit them to conduct themselves with credit in the society in which by birth they are entitled to move. This should, if possible, be kept secret from their companions.

Why should not the new University be empowered to confer a degree in architecture? Surely it is a science. The degree might, to avoid confusion, be Coryphaus, to rank as high as Mayister, and be taken two years after that of Bachelor of Arts. Anxiously expecting the publication of your next number, I remain, Sir, your obedient servant,

A KING'S COLLEGE STUDENT OF MEDICINE AND SURGERY.

THE WITHHELD MEDICAL-REFORM-ESSAY PRIZES.

To the Editor of THE LANCET.

Sig .- I have read with equal surprise and indignation, in THE LANCET of Nov. 21st, the letter of Dr. Epps, on the subject of the medical reform essays. A more flagrant breach of faith to the writers of the several essays which were so many months ago transmitted to Dr. Epps, it is impossible to conceive, than the statement contained in that letter, that "the Committee of examination have decided that there are not any three of the essays descrying of the prizes. On referring to the original conditions, published with the signature of Dr. Epps, as secretary to the Medical Reform Associations, I cannot discover any reference whatever to the abstract merits of the essays. They simply state, that " For the best essay will be awarded the sum of 50% sterling; for the second, the sum of 30%; for the third, the sum of 201." It was the comparative merits of the essays alone, then, that the Committee of Examination had to

dapide upon. With their intrinsic merits, far as the primes were conducted, they he had become fittle meritor make the primes were concerned, they had nothing to de, and however still meritori-ous they might be, providing the proposed conditions were attended to, the three buswere as much entitled to the prizes, as if they had actually come up to the beau ideal of perfection which the Committee now assume as necessary to render them "deserving of the prizes."

Of Dr. Epps I know nothing, but as an honourable member of a liberal profession I am sure it must be extremely painful to him to be made the medium of communicating to the public so dishonourable an instance of broken faith. That Mr. Hume can have sanctioned such a proceeding, I am unwilling to believe, but as the tressurer and only declared member of the Committee of Examination, he will do well to use his influence in obtaining justice for the writers of

the essays.

It would be easy to dilate on many circumstances connected with the proposed prizes of the Medical Reform Association; more especially the great delay that has taken place, - without any explanation,-the promise which Dr. Epps formerly made of an early decision, and the extraordinary effrontery with which further competition is invited for prizes which unquestionably belong to writers who have already contended for them. But, in the hope that a feeling of shame will induce the Committee to perform, without further delay, an act of justice which they must perceive to be in-evilable in the end, I shall for the present I remain, Sir, forbear.

Your obedient servant, PHILO-JUSTITIA.

Nov. 29, 1835.

APOTHECARIES' HALL.

To the Editor of THE LANCET.

SIR,-An instance having very recently occurred under my own observation of the treatment of students at Apothecaries' Hall, I am induced to forward the facts to you, in order that students may see the necessity of strictly adhering to the regulations of the Hall, however difficult of performance and mysterious they may appear.

A pupil who had entered to all the required lectures (perpetual), presented himself at the Hall, for examination in Latin, but being wholly ignorant of the form of registering, he had omitted to register during the time usually allowed. To obviate this he was advised to address a petition to the Board of Examiners. He did so, and was told to call upon the Secretary (Mr. . for an answer. This be has rewithout obtaining any,

[&]quot;Corypheus" means the Master, Chief, or Priceipal, in any thing. The degree therefore of "A.C. could not lead to any confusion, while that of "A.M.

selved, much too long, yet, as it was the now for certain that his petition was laid customary time allotted to all, I had no reason to complain, and reflected that I should in my turn derive benefit from the assistin by them comments on a select Mr. ance which my apprentices would afford me Watson what he had better do. Mr. W. during the latter part of their stay. Accordend, "I know nothing about the case. I ing to the present regulations, medical men un no more than a post-office to the Hall, are expected to dispense with the services You have your answer and there's the door." of their apprentices just at the time they referred to Mr. Watson, upon whom he and the pupils are compelled to attend a called, in my presence, for the tenth time; tedious routine of studies, subject to such but on giving his name and stating his busi- complicated regulations as are exceedingly ness, Mr. W. said that no such petition as annoying and harassing to them, and reflect his had ever been sent, and when I told the utmost disgrace and discredit upon the own hands, a few mornings previous, he allow insertion to these remarks, I am, Sir, declared that my statement was false; and your obedient servant, when I told him that we had been under the necessity of calling eight or ten times within three weeks, he said it was all "a lie," and that he had never seen either of our faces before. And this is all that my friend can learn of his petition. Is this the language which ought to be used by the Secretary of the Apothecaries' Company, to students praying . for information? Of his ungentlemanlike conduct I will say nothing, as it is only what students must expect in that neighbourhood. But he should remember that although he is Secretary to a Company who derive a great income by the contributions of students, he may live to see the abolition of that Company, as the result of the combination of those students with the thousands of practitioners who are already rendering their powerful influence to place medical education under the superintendence of a very different hody of men. I am, Sir, your obedient servant,

A MEDICAL PUPIL. December 5th, 1835.

. The name and address of the writer of this letter have been placed in our haads.

TERM OF APOTHECARY APPRENTICESHIPS.

To the Editor .- Sir, -- I cannot forbear noticing the very extraordinary conduct of the Examiners of the Apothecaries' Company, in making so many alterations in the regulations for apprentices. When I was bound apprentice, about eighteen years ago, I was distinctly told that it was necessary I should serve the whole seven years, prior to my attendance at the London hospitals. Two years after the expiration of that time, being established in practice, I took an apprentice, and was then told that the Court thought the seven years too long, and that they would be content with five years' actual serpitude; it now appears that they consider three years sufficient, which is surely unjust and though I certainly

He ton applied at the Hall, but was again are beginning to be most useful to them. him that I saw the petition in his (Mr. W.'s) Court of Examiners. Trusting you will

TREATMENT OF PRACTURES.

To the Editor .- Sin,-The scientific observations of Mr. Radley on the treatment of fractures in late numbers of your invaluable publication, bring to my recollection the practice I witnessed when assistant to Mr. Clapham of Thorney, who has now been in the habit, for upwards of thirty years, of invariably treating fractures on the same principles as Mr. Radley. His sons, I understand, pursue the same plan. It is to be regretted that men of such long standing in the profession, and who have enjoyed such opportunities of gaining professional knowledge, do not communicate to the public some of the many valuable cases which must necessarily have thus come under their observation.- I remain your ardent ad-M. D. W. mirer.

Borough, Dec. 4, 1835.

MEDICAL MAGNETISM .- To the Editor .-Sir,-In the report of a meeting of the Westminster Medical Society, published in your valuable miscellany of the 5th instant, it appears that Dr. Epps thought proper to state "that a gentleman had offered to Messrs. Watkins and Hill of Charing-cross, 100 guineas, if they would produce magnets having the like power (referring to those prepared by Dr. Schmidt). They tried, but at last were compelled to acknowledge their incompetency." Now, Sir, we trust you will afford us space to give the most decided contradiction to that statement. Why our names should be thus thrust forwards to advance the views of Dr. Schmidt, we know not; but this we do know, that neither with the Doctor, nor with his magnets, are we in any degree acquainted, nor have we ever made any attempts to compete with him. Hence it is clear that Dr. Epps must have acven years, which I been labouring under some strange delusion

NOTE FROM DR. SCHMIDT. - To the NOTE FROM DR. SCHMIDT.— 10 IN-Billion. Sir, I am auxious to eap y to your question in the last Number of THE LANCEY "if Dr. Schmidt, withholds any information relative to his mode of constructing magnets," in the negative. It will be constructing magnets," in the negative. It will be obvious to you, but it making knows the chemical theory upon which I constaint in magnets I farmish the clue to similar results which are equally stationable by others. I saving found what I consider the right path, I point it out to the scientific world. Need I do move I I avail myself of this apportunity to thank you for the full and favourable report which you have given of the disensions at the II calminater Mellical Society, so mineral, or, as you p sperly term it, medical magnetism; and to ask you if any repurs of cases of care by the tournet will be acceptable to you'l I so, I should feel obliged by the publication of two or three complete ones, which I can authenticate. I am, Sir, your very obedient servant,

CHARLES SCHMIDT.

127, Regent street; Dec. 994, 1835. 137, Regent street; Dec. 9th, 1835.

*5° If Dr. Schmidt transmits to us, for publication, any cases which have occurred to him sloce his resi-dence in London, we will certainly endeavour to find room for them in our columns.

CORRESPONDENTS.

THE note of Argus is the product of a malicious mind. We believe that the private lecturer whom the writer attempts to vilify, discharges his duty more effectively and scientifically than any other private teacher in the metropolis. One thing is curious in connection with the menical

when he made the assertion, to which, in justice to ourselves, we have been compelled to advert. We remain, Sir, your obedient servants, Warkins and Hill.

5, Charing-cross, 8th Dec., 1835. by the pupil, but that he gets the whole of his knowledge from some teacher who discharges his duties to his class at his private residence. Now when a candidate who is known to have been the pupil—whener an inattentive one or not, - of a private teacher, happens to be pasuccessful, all the " recognised" gentry, and many of their idle pu-pils, exult at the defeat of the rejected party, and in their tumult of joy the lecturers often forget that the rejected person had been their own papil during more years than he had been of the private teacher during as many months. In other instances, parties who rejoice may be moved in their exultation by even less worthy feelings. A private lecturer, in cases of the rejection of his pupils, is wholly exonerated from blame, unless it can be proved that the competency of the candidate was certified, -cither orally or in writing, - previous to his application to the medical boards to be admitted to an examination.

> Will Humanitas, of Rochester, whose communication was inserted in THE LANCET of Nov. 21st, fayour us with his name and address? The one first sent has been accidentally mislaid. Will our correspondent object to his name being communicated privately to a gentleman who is actively interesting himself in an attempt to improve the medical arrangements in the Unions?

The communications from Mr. Way, the schools of the metropolis. Candidates, it is well known, are not admitted to examinate are all manoidably postponed for a week.

LECTURES

...:

DISEASES OF THE BRAIN AND NERVOUS SYSTEM.

NOW IN THE COURSE OF DELIVERY IN THE UNIVER-SITY OF PARIS.

BY M. ANDRAL

Physician in Chief to the Hopital de la Pitie, and Protostor, and Lecturer on the Principles and Practice of Medicine, in the Faculté de Médecine or Paris.

LECTURE IV.

ENCEPHALITIS.

To DAY, Gentlemen, we propose passing in review the several symptoms by which inflammation of the brain is accompanied. The greater part of them, as you shall presently see, consist in certain modifications of the phenomena which depend on the life of relation. We shall commence with the most striking, those which cannot escape the notice of the most common observer. Many of these symptoms are produced by a greater or less trouble of nutrition. Let us examine them first briefly, and take up, to begin with,

Lesions of the Functions of the Digestive Apparatus in Acute Encephalitis.

In many individuals affected with encefunctional derangement of the digestive the seat of disorders more or less severe; and the digestive apparatus presents to us several notable troubles. And first of vomitclose. Here, as in many other circumstances, the symptom has its seat in the stomach; spal causy of the phenomenon is ther and a far distant organ. Least nausca, very fre-

_____ encephalitis. Sometimes the vomiting is observed only at the very commencement of the disease; sometimes it persists for several days, or even during the whole course of the malady, the patient throwing up an enormous quantity of bilious matter, or being unable to taste a drop of fluid without occasioning nausea, and rejection of the contents of the stomach.

In a great number of cases, also, we remark another symptom connected with the digestive tube, which, like the former, is an effect of sympathetic influence, propagated from the centre of the nervous system, and not a sign of disease in the canal itself. This is constipation of the bowels; a phenomenon very frequently accompanying the different forms of encephalitis. In many cases it is carried to the highest degree, and alvine evacuations are obtained only by the most powerful drastic purgatives, or the condition of the intestinal canal resists altogether any means that we can employ to overcome it. The vomiting, nausea, and constipation, of which we now speak, are frequently the only lesions of nutrition that the patient may present. The tongue generally re-mains natural (we suppose the disease without complication), clean; the abdomen indolent and free from pain, rather contracted than tumified, or tympanitic. It is of the highest importance to pay due attention to these latter symptoms, for the derangement of the stomach, especially when connected with headache, may very readily impose on the physician. The presence of vomiting &c. when it coincides with a natural state of the tongue and abdomen, and, above all, with phalitis, we do not observe any appreciable the absence of meteorism, is a sign of the greatest value, to distinguish at an early tube; but in the great majority of cases it is period those nervous symptoms which depend on an idiopathic irritation or inflammation of the brain, from typhoid and other dangerous febrile affections, where the lesion ing and names, two of the most striking really occupies the mucous surface of the symptoms by which the commencement of digestive tube.

These are the principal inflammation of the brain is frequently dis- lesions of the functions of the digestive passages which present themselves in cases of encephalitis. Let us now turn to

Lesions of the Circulatory Apparatus.

The disorders produced by inflammation se onset of acute of the brain on the circulatory apparatus are

twice in a river on the same day; after com- to ing out the second time he lay down on the bank and fell asleep, without his hat, exposed to a burning sun; on awaking he was perfectly speechless, though he was able to the abstraction of blood, in proportion to the walk home, apparently in good health. organ.

Encephalitie.

the disease terminates rapidly in death : the patient does not survive the commencement the head, has sunk into a state of collapse of the attack more than twenty four hours. In other cases the march of the disease is more slow; it may be prolonged to thirty ar forty days, or two months; but if the patient continue to show symptoms after this latter period, we must consider him as lahowing under the chronic form of the dis- dued, but, still more, watch your patient ease. The termination of encephalitis is not less variable than its duration; the patient may recover, and then his recovery is either perfect or imperfect; in the latter case, the troubles which remain are generally connected with movement. Some patients conserve a strabismus for a greater or less period; others present a contraction of one or several fingers; finally, others are affected, it is often a matter of the for a long time after the subsidence of in- to recover the pat flammatory symptoms, with a well-marked stration into whi

the attack. After death, the substance of nefit in cases of encephalitis and other inwas in a state of ramollissement, mixed with cold directly to the patient's head,—a power-supporation. The ventricles were distended ful remedy when cautiously administered, with fluid, and the membranes, in many but it requires a good deal of care and judgment. A grand principle in the application This is a remarkable case of inflammation, of a low temperature, in cases of cerebral of the brain, where the first symptom was a inflammation, is to withhold this means unsudden loss of speech; and remark, that the til such time as the febrile reaction has been injury does not seem to have existed more brought down by sanguineous emissions. towards the anterior lobes of the brain than and other similar remedies. If the disease, any other point, though many physiologists indeed, has commenced without any re-would there place the power that governs markable acceleration of the pulse, in-the production of the voice. In many other creased heat of skin; in a word, without cases, the first accidents are not seen to- fever; then we may have recourse to cold wards the brain, but commence in the or-at a much earlier period. However, its gans of nutrition. We all of us know application is always attended with two how frequently meningitis is announced by micronvenicness, that render its manage-comiting. The irritation of the brain is pro-ment difficult. In the first place, if the inpagated to the stomach, and gives rise to flammatory reaction has not been sufficiently irritation and rejection of the contents of the | reduced, by the means we have pointed out, latter, before it has lasted sufficiently long to before the couployment of cold, we run a produce actual inflammation of the former great risk of aggravating the symptoms instead of calming them. In the second place, the effect of cold, at a low tempera-The Duration and Termination of Acute ture, is, in many cases, to throw the patient into a state of prostration and collapse that These are very variable. In some cases is very alarming. In some instances, the patient, shortly after ice has been placed on and even coma, which have been dissipated with the greatest difficulty, or terminated in death. You must, therefore, pay especial attention to this point, and when you employ cold, take care not only to see that all febrile reaction has been previously subwith care, and on the first appearance of prostration, reflect how far this symptom may not be an effect of the powerful re-medy you have applied. Perhaps this latter inconvenience is more to be dreaded than bi the former. In the one case you can subdue the symptoms of renewed febrile ac antichlogistic measures ; but

ACUTE ENCEPHALITIS.

Let us now consider the different ways in rience to determine in what cases it is applicable, cold may be applied. These are various. The first and most common is the Finally, we may employ cold under antate the patient by its weight. It is also employed the results cannot fail to be bene-necessary to warn you that cold may have ficial. very different effects on the sensibility of Repulsives are another very useful class of full exercise of his intellectual faculties.

we may follow the example of those who evert the water guttatim, drop by drop, from a short distance above the head; by this means the temperature is gradually reduced, and the effects which result are often of the most encouraging nature. Not long ago, I had occasion to see a young person who was labouring under all the symptoms of acute inflammation of the brain. We had recourse to the use of cold, under the form now alluded to; water was allowed to drop slowly on the patient's head, and a complete recovery took place. This case was attended in conjunction with M. RECAMIER, and remark, that no other active treatment of any kind was employed, although the disease presented itself with symptoms of a very bore nature.

Lould cite numerous other cases which

the services in a second about it.

application of ice to the head. It is essen- other form, viz. in that of general ablution. tial that this should be done in a permanent. The different modes of applying a reduced manner; the temperature must be kept temperature will depend partly upon the constantly at the same point. A temporary predilections of the physician, partly upon reaction of temperature is more likely to the specific object he may have in view; but, occasion the reaction we have already on the whole, we may conclude, that cold is a spoken of, than to produce any benefit. The therapeutic agent to which we may often ice should be pounded, and care must be have recourse with advantage in cases of taken that it does not incommode or irri- encephalitis, and that in whatever form it is

certain patients. In some cases when we remedies in the treatment of inflammatory place the ice on a patient's head it gives rise affections of the brain. We may apply them to a most unpleasant sensation that is sup-ported with difficulty. Sometimes this goes off; in other cases it persists, and may be-come so distressing as to compel us to aban-bear in mind that it is only at certain pedon the remedy altogether. In other cases, riods of the disease, that we ought to have on the contrary, the sensation produced is recourse to cutaneous irritants, viz. when of an agreeable and soothing nature. As the symptoms of reaction have been comthe temperature descends, the symptoms of pletely subdued by sanguincous emissions, excitement vanish; the agitation and delior by cold. However, let me remark, that rium disappear, and the patient recovers the some patients will not bear the application of revulsives to the skin; in many cases Instead of ice, some physicians prefer the action of a blister has been sufficient to the employment of cold offusions, at a tem- bring back all the symptoms that were disperature varying from 22%, to 18° or 16° sipated by a previous blood-letting; the agi-(centigrade). We can rarely have occasion tation recurs; the patient is seized with to go below the latter; it is quite sufficiently convulsions, and paralysis, or relapses into a low for every practical purpose. The affirm state of coma, immediately after the cutasion is performed by pouring water, at the neous nerves are stimulated by a sinapism. temperature just indicated, for the space of 1 am, therefore, very sparing of this form of two or three minutes on the patient's head, revulsives in cases of encephalitis, although after which we cease. This may be repeated in many particular cases their utility is in-once or twice during the day according to contestable. Thus, when the coma persists circumstances. Sometimes we prefer esta- for a length of time, when the sensibility of blishing a constant current of cold water on the skin is excessively obtuse, when the eye the patient's head; or, finally, in other cases, is insensible to light, and the pupil remains without movement, we may have recourse to energetic revulsives with advantage, in the hope of stimulating the powers of life, which seem on the point of becoming extinguished. This is a practice which is very successful amongst children. On the contrary, when the heat of the skin is elevated, when the pulse shows symptoms of reaction, when the erythema of the brain is betrayed by excessive agitation or delirium, then I would abstain altogether from the employment of a means which would in all probability but increase the existing degree of irritation. In cases of this kind I prefer addressing the revulsives to the intestinal canal, provided we have no signs of irritation or inflammation in the abdominal cavity.

When the belly is indolent and free from the efficacy of cold as a means of pain, the tongue clean and moderately husperebral inflammation; but it is mid, I have no hesitation in administering t know how to manage. active purgatives, with the design of promot-the property of the digestive tube. Several authors tain degree of expe- partake of this opinion. Thus, Dr. AseaCROMBIE (and I quote from his work in pre-ference, because it is filled with highly in-did not rights' depend upon this action on teresting and useful observations) says, "In all forms of the disease, active purging appears to be the remedy from which we find the most satisfactory results; and although blood-letting is never to be neglected in the earlier stages of the disease, my own experience is, that more recoveries from head affections of the most alarming aspect take place under the use of very strong purging, than result from any other mode of treatment."

We have now to notice another remedy which has been counted as a true specific in inflammation of the brain by many writers; this is mercury,—a means once looked up to with the utmost confidence in the treatment of encephalitis and several other inflammatory affections. In a question | sideration of of this kind it becomes my duty chiefly to lay before you the result of my own observations, and this I shall endeavour to do as briefly as the subject will admit. Mercurial preparations are employed under two principal forms to combat inflammatory affections of the brain; the first is in the form of frictions, which are usually practised either on the sides of the neck, or behind the ears. I must confess that I never saw any decided advantage obtained from the administration of moreury under this form. You can readily conceive that inflammation of the cerebral substance is a disease requiring the employment of remedies whose action is prompt as well as decisive. Now mercurial frictions have the great inconvenience of requiring a certain length of time for the introduction of the remedy into the economy, and before this the inflammation may have assumed a fatal character. Perhaps this form may be innocent, but it is one which does not merit any particular confidence. The other form, and it is a far more general one, in which mercury has been administered, is internal, and the preparation selected, by almost universal consent, is calomel.

You are all acquainted with the prominent part which calomel has played in the treatment of inflammatory disease, especially in the various affections of children; but here an important question suggests itself. Is calomel, as has been said, really a specific remedy in certain inflammatory disorders, or is its action rather to be referred to the purgative effects which follow its administration? This question can only be answered by a careful observation of facts. Go, then, into the hospitals, and obscrve what passes there; or, if you have already had occasion to follow several cases of inflammation of the brain, reflect upon the phenomena you have witnessed, and you will find that in all the fortunate cases the administration of calomel has been followed by decidedly purgative effects. We may landysis of these a

100

attribute. The predilection generally shown by practitioners for this preparation of mercury may be accounted for upon other grounds. Calomel is an excellent purgative, and suitable to a great variety of cases. oft does act in an irritating manner on the digestive tube; and, from its insolubility, it does not communicate any bad or nauseating taste; this latter circumstance is not without importance in diseases of the brain. where we should avoid every cause of irritation; it is particularly important in all affections accompanied by delirium, where we often have the greatest difficulty in inducing the patient to take the necessary medicaments. Let us now pass to the con-

Chronic Encephalitis.

Here the observations we have to make will be brief, for the disease bears a close resemblance to the acute form which we linve just terminated. The anatomical characters of chronic encephalitis are nearly the same as those we have given for the acute stage. However, induration of the cerebral substance more frequently accompanies the former than the latter. We also more frequently observe, as a consequence of this variety, the formation of abscesses in the substance of the brain, of cysts with strong, fibrous, well-organized parietes.

The causes of chronic encephalitis are the same as those which determine the acute form; and it may precede the latter, or succoed an imperfect cure. The symptoms also are the same; they consist almost exclusively in lesions of intelligence, of sensibility, or of motility; the march of the disease, however, is different, and it is in this circumstance alone, that we are to look for the differential characteristics of the two forms. In the chronic form the symptoms succeed one another more slowly. The intelligence remains intact for a more considerable period; the lesions of mortality are more uncertain, and the disease terminates either in a sudden exasperation of the accidents, or by producing a profound though gradual influence on the different acts of organic life.

Chronic Inflammation of the Cerebellum.

There is one part of the brain, which, as we before remarked, is but little subject to attacks of acute inflammation, but which oftener presents traces more or less well marked, of having been the seat of the chronic form. This part is the cerebellum. We might perhaps he able to collect eight to nine examples of chape mation of the cerebellum, who was simple, that is, similar lesion of

variety of symptoms accompany the disease Our remarks upon the treatment of in-in this portion of the nervous centre. The flammation of the ccrebellum, shall be very most striking phenomena certainly are connected with motility: here we observe the principal lesions. In many cases paralysis has inferior extremities; the scat of the paralysis is addifferent. we are really been noted as affecting the superior or the udifferent; we are not able to establish a greater frequency in the pectoral, than in the abdominal members. In other cases the power of the muscles seems merely weakened; the patient's gait is vacillating. In one single case the patient suddenly fell down. In other cases, however, we do not observe any lesions of movement; it is the sensibility which presents more or less remarkable modifications. Thus in two cases, the prominent symptom was a very acute sensibility of the whole skin, and after death an abscess was found occupying one of the lobes of the cerebellum. In one case the only lesion of sensibility consisted in an acute pain in the occipital region. In one several diseases of the cerebellum. This is especially noticed in cases where tubercles troubled with a constant nausca only.

Such are the symptoms that usually accompany chronic inflammation of the cereany general principle, or to say why at one open abscesses situated near canals early. time the same lesion should merely produce have aliuded to, the symptoms almost seem to be individual, and any attempt to generalize them in the present state of our knowferent points of the organs which are and is far from being uncommon. compromised in the disease. For the cerebellom this explanation is much more easily ascertained that the wrethra is pervious, and that nothing is the matter with it, treat the abscess as a common abscess only with the

short indeed. It is precisely the same as that for encephalitis in general; the main remedies being sanguineous emissions, cold, and revulsives.

ST. THOMAS'S HOSPITAL.

CLINICAL LECTURE -

ON CASES OF

ABSCESS IN THE PERINEUM.

Delivered in the Session 1835-6,

By MR. TRAVERS.

GENTLEMEN,-There are, I think, no case observed by Dr. Gall, the predominant cases under my care of more profitable obsymptom was blindness. We have already servation at this moment than those of fisnoticed how blindness is connected with tula in perinco, of which there have been and are now several here.

This abscess of the perincum takes place have been found imbedded in the substance under very different circumstances. Weoften of this part of the brain. It is not easy to have it quite independent of the urethra, as explain the reason of so remarkable a phe- we have abscess in the neighbourhood of the nonpenon. pate than delay the operation, by making a passage. Such a communication, however, free and deep incision; and in that way you is more likely to happen in cases in which will be very likely to save the urethra.

A very common cause of a second class urethra itself than in the first class of cases,

confined to the original scat of the gonor-rhea, which is within an inch or two from the extremity of the urethra, but trans-lated from thence to the bulb, the mem-disease. There is no danger of extravabranous part and the prostatic portion of the sation following their creation, for they are urethra, -all this being the result of neglect, so defined by the artificial cuticle produced or imprudent conduct, -venereal excite-by the athlesive inflammation which is inment, and other such causes. Thus inflam-stituted from the moment that the lesion matory irritation and spasmodic stricture or wound takes place in the lining memof the lining membrane of the urethra fol. brane, that extravasation will not follow. low gonorrhoza, which produces, by local An opening on the anterior side of the striccontiguity, inflammation of the sheath, and ture is generally the result of wrong treat-the parts surrounding the sheath, of the ment,—of a false direction given to a bougic, penis, and the parts situated in the peri—mot the result of the rive-a-tergo of the urine, from the action of the muscles in emptying Another class of cases is that in which the bladder. Anterior openings are found you have not spasmodic stricture of the to be contrary to the direction in which the arethra, but permanent stricture. Now here, urine passes, and the disposition of the cresage of the urine, the parts will take on the Now the inflammation in these cases suppurative process, and abscess will result.

stimulating the loughing, producing gan- and the cellular membrane covering the grenous inflammation, and then a free nenetration, on all sides, of the contents of this abscess, into the surrounding loose cellular texture of the perincum, there being nothing to oppose a resistance to an indefinite tent of extravasation.

An abscess in the prostate gland being confined within the sheath or fascia which contains those parts, will discharge itself after having produced a complete retention of urine. I have, on one occasion, passed a catheter below the prostate gland, when it has contained matter, and the urine has flowed, after the evacuation of half a teacunful of pus, proving that there must have been an immense abscess there. In such case, the whole inflammation has been confined to that one spot, and has terminated there, like an abscess of the wall of the intestine, within the canal; but this is very neck of the bladder. If matter forms in the parts forming the body of the penis, then extravasation will be the result, and the existence of gangrenous inflammatian is known feter it presents on being discharged.

If in such cases the stricture be imperconstances, as well as Mr. CLINE.

The effect of extravasated urine is to de-162 tion, in parts that are favourable to the extravasation, yet it becomes a question whether the extravasation has extended to the parts so discoloured, or whether the discoloration is merely a symptom of that sympathetic inflamination which the common cellular membrane takes on in the is diseased. In one of the worst cases that we had lately in the hospital, there was decable discoloration of the abments; and although there

muscles of the abdomen, had admitted the urine, and that, consequently, all those parts were condemned to undergo the sloughing process. However, I gave it as my opinion, having often seen such before, that that would not be the case, believing it to be only a sympathetic inflammation of the neighbouring cellular membrane. matter is of great importance as regards the result, and my observation proved to be just in this case. The man got perfectly well after the operation was performed. The after the operation was performed. simply inflamed spots supported freely on being opened, there being no dead substance at all in them, the puriform matter being perfectly healthy, and although sinous communications existed between the abscesses, they healed up kindly, as soon as the matter was discharged. This could not have been, if there had been any sinous comrare, and never happens, I think, in these munications of extravasated urine; because, parts, except in abscess of the prostate, in as I said before, I never yet saw, in a vast the portion of the urethra anterior to the collection of cases, a case in which the collular membrane did not die to the full extent of the extravasation of the urine, and was not cast off in the form of a slough.

The necessary operation, where an ahby the decomposed state of the pus, and the seess has not communicated with the arethra, consists merely in feeely opening the abscess. Where it is connected with stricture of the meable, so much the worse, because the dis- prethra, it is right to take up the treatment case will be the more troublesome. But the of the stricture as soon as convenient, after abscess may be combined with, or depending bacing discharged the abscess. I should, sin-ply on, a bursting of the methera, the re-thowever, he in no hurry to attend to this, if sult of accident, and without any disease, the person passes his urine freely; I would This happened to the late Lord Clark, rather provide for the full and free dis-While leaping a ditch his horse stumbled, charge of the abscess. But, in a case of threw hirs forward on the pummel of the inspermeable stricture, whether with or saddle with great violence, and burst the without abscess, the operation of cutting urethra. He became a patient of Mr. down upon it, and dividing the urethra at CLINE, who performed the only operation the point of the stricture, becomes necesthat could be employed in that case, - that sary. In hospitals, cases of extravasation of dividing the parts freely, and connecting occur very often, though cases of imperforate the criss of the arethra to an elastic cutters stricture, justifying the operation, occur but ter, and the case did very well. I have seldom. Yet I must say, that when they do heard one of his own family detail the circoccur, they do, according to my experience, perfectly well. In some of them you cannot introduce the slightest instrument with stroy the cellular tissue in all cases. But any justifiable degree of pressure. You canthough you have a block indicating inflam- not pass the best adapted metallic instrument into the bladder; even a small probe would not pass the stricture. In such cases the operation of cutting down upon the stricture becomes absolutely necessary. You place the patient in the position for lithotomy, and freely divide the strictured parts with the knife,-the parts not having been noghbourhood of some officer portion that changed, observe, by extravasation of urine, or the surrounding external inflammation. I am supposing that there is nothing more the matter there than the impermeable stricture. The operation is then not atgroins which was not tended with any considerable difficulty, the gentlemen enter- anatomy of the perineum not being altered both the cellular by inflammation or extravasation. In the case of extravasation of urine, which will sometimes happen almost suddenly,in the course of forty-eight hours,-from the neglect, for instance, of a perineal or a half the wall of the canal is deficient, and scrotal abscess, the scrotum may become ordematous, swelling very rapidly, becoming almost as large as it is possible to ima- It must be, in part, an artificial passage. gine, and as black as your hat, the patient tion: nor need you where you have a large the perineum. The occasion is analogous to that of mortified hernia; you have no occasion to go about seeking for the ends of the not do so. You had better spare your labour, for the ends are placed in better appothat is entirely removed by the free division So, in the case of extravasated urine, having discharged the bladder, which you do by making an incision of several inches length it is labour in vain to look after the canal. you provide for the ready and imme You will find that after the urine has secreted, it comes away with the greatest freedom. The mischief is already done, and your placing an in you can adapt the treatment of the case, tallic or otherwise, with reference to its final purpose, much time you perform the more advantageously when the bladder has ever happens that the

into the bladder, substituting for that, as recovered itself, whon it is irrita-soon as you can, an elastic gum catheter. In bility, and when the sympathy between its suffering state and the system is at an end. Indeed the relief obtained from a free discharge of urine, as compared with a very imperfect and difficult discharge of that fluid, is inconceivable. The fever then specsides, and there is no longer any difficulty in passing an instrument, for the fact is that you have only therefore to take the direction which you know the canal should have.

So soon as the sloughs have been thrown being in a very bad way, in short, dying. off, the granulating surface begins to show Long before such a state arrives, and as itself on the sides of the wound. Wait for soon as it is ascertained that the urine is that; wait until the system has rallied, and making its way from the bladder into the availed itself of the relief afforded by the cellular substance, there should be a free in- operation, and then you will have no difficision made along the line of the perineum culty in passing an instrument, and in keepscroti to the whole extent of the extravasa-ing it in the bladder. But do not attempt tion. If the scrotum be not implicated, of to pass one before. The difficulty will lessen course it is not necessary to divide it; if it be, just in proportion as the process of filling it is right to divide it, and to do so upon the up and healing goes on. If you do not at line of the raphe. There the neest discharge tend to this you protract the good effects of is produced, the most equal and uniform. By the operation, for to pass the instrument is laying open the integuments on either side a proceeding of great difficulty, owing to of the raphe of the scrotum, you do not obtathe old sinuses which have formed in some tain so uniform a discharge as by taking cases, and to the totally altered and thick-the central line; and the incision may be ened condition of the perincum and the celmade there with the greatest depth, free-lular membrane. It is often a very difficult dom, and safety. The relief that follows, matter to find the extremities of the ure the enormous draining of purulent urine, thra, and you do not dilate the urethra or urinous pus, and the quantity of layers without considerable risk. A case occurred and shreds of cellular substance that are not very long ago, which some of you may discharged, is miraculous. You need not remember, where a narrow-bladed straight be solicitous of bringing the ends or the extended was carried in the direction of the tremities of the urethra finely together; that bulb of the urethra, behind the arch of the is a matter of little importance. It is far pubis, towards the bladder, to dilate the better to put the patient to bed. You do not stricture when the patient seemed to be on pass a catheter after cutting for the stone. the point of recovery. This was followed in that case you have no fear of extravasa- by a venous hemorrhage which, though we could not control it, and would by no means, opening made, partly by nature and partly under ordinary circumstances, have been by art, and in the line of the urethra and sufficient of itself to cause death, yet in the very exhausted state of the patient, did terminate life. The dissolution could only be attributed to that. However, it was a mortified gut; in fact, you had much better bleeding over which we had no control. Probably it was the vena profunda that was wounded. A plexus often lies at about the sition by nature than they can be placed by back of the bulb and prostate. Upon exayou; and, as to the stricture, the effect of mination it was found that the kuife had taken the direction of the bulb, onward to and the exit you have given to the slough. the bladder. I have seen a person for an hour, or an hour and a balf, or for nearly two hours, suffering the most dreadful agony, which may be got rid of as soon as you into the scrotum, and of a depth sufficient have given a free discharge to the extraonto remove the urine and morbid contents; sated urine and the sloughs, and in so doing discharge of the urine.

Well, then, there is another

hat time. The first to same the reflacion, because the instrument you let up inflammation of the lining membrane, hat time. vhich goes from matchform to puriform, and and in supportative inflammation, probably erminating in the destruction of the entire nucous membrane of the parts, besides coming up the irritation which you ought o subdue. I have so often found it necesary to remove the catheter, which has been utroduced at the heels of the operation, hat I am quite sure that in all cases it is vrong to introduce it, except where you are perating on undiseased parts, such as in sursting of the urethra, for in the latter ases it is important to introduce an instrunent, and there is no reason on earth why ou should not; but the same argument hat holds in favour of the practice in the me case, tends to favour the converse pracice in the other. Certainly, it is not right o introduce any instrument where the parts tre broken up by disease. Finally, let me epeat, gentlemen, that a free urethral insision is the proper remedy against the danrer of that extravasation which is evidently hreatened where the patient cannot pass a brop of urine, and you are unable to relieve nini in any other way against that consemence.

I may just name to you, that in one of the cases in the hospital, the formation of perineal abscess, without the smallest tendency to extravasation, was proved, by the perfectly permeable state of the urethra. The man was operated upon for the abscess it the time the nrine was passing. In unother case, also, in which the incision was made, both cases being cases of abscess ollowing gonorrhera, there was no stricture, and the instrument in that case also passed freely into the bladder. A third case was one which came under the care of Mr. SOUTH, when I happened to be out of town, where there was retention of urine, and where the operation of dividing the stricture was very successfully performed. This was a case unattended with extravasation; it happened in a man named Jones, who now passes muciform and not puralent urine, and who is getting better. The other was sbaces. A free division of the raphe scroti et perinci was made in that case for extravasation. The incision was both extensive and deep, and the patient went out perfectly well.

CLINICAL LECTURING .- I do not know any framan contrivance that can more effectually oblige a medical officer to study carecase of his patients, and at the cautious in the remedies he d himself under the neaccessed of every-public manner.

CLINICAL LECTURE

ON CASES OF

GONORRHIEL, POISONING FROM ARSE-NIC, IDIOPATHIC ANASARCA, AND PE-RICARDITIS.

Delivered in the Session 1835-36.

BY DR. ELLIOTSON.

GONORRHEA IN THE FEMALE .- Creceote. The first patient to be spoken of to-day is a French girl, admitted on account of gonorrhea. It appeared from her own account, that she had caught gonorrhoes several times. There was a very considerable discharge of a darkish colour, and slight swelling of one of the labia. She said that she had been labouring under the disease now for many months, but had been much worse within the last five or six weeks: she had very probably caught it afresh. She was ordered two drops of creosote in an ounce of water every four hours. The dose was increased to four minims, then to six, and then to eight minims. I gave her this, because I had heard that creosote has considerable power in gonorrhea. For myself, I have had no experience of it in this affection, but I thought the account probable, because turpentines have always had considerable reputation in gonorrheea after the inflammatory state was over, and creosote is very analogous in many of its properties to turpentine. During the whole time she was labouring under gonorrhea, she had suffered with pains of the head, and bones of the legs and arms, as well as in her shoulders and back. At the same time that the creosote was ordered her, she was directed to have a warm-bath every day. This treatment was begun on the 12th of August, and on the 29th it did not appear that the discharge was diminished. I myself have never seen any internal medicine do good in the gonorrhox of females, excepting where the case was inflammatory, and antiphlogistic measures were had recourse to; but I have always seen the greatest advantage where the inflammatory stage was over, and also in leucorrhoca, from the employment of an injection of the nitrate of silver. I am not satisfied that internal remedies are of the least use either in leucorrhos or gonorrhos, excepting so far as they overcome the inflammatory state, if the state be inflammatory, and so far as tonica, if required, may act by strengthening the body, but I have not seen gonorrhea itself controlled by any tonics, astringents, or specifics, given internally. There is, however, a local application, which is, I believe, recommended by many practitioners, and which has,

I think, far greater power over gonorrhæs | water and chalk andand leucorrhora than any other local application, where there is no inflammation; and that is the nitrate of silver. Some females will bear two, three, or more grains to the ounce, but it is always better to begin with a small quantity. I myself am in the habit of beginning with a quarter of a grain to an ounce of water. This I ordered for her. At the same time that this was commenced, the dose of creosote was increased to nine minims. On the 5th of September she complained of great bearing-down pain, said of September, without my seeing any rea- she went out perfectly well. son to believe that creosote had been useful.

ease at once, if given within the first forty- either generally or locally, eight hours, but after that time it has disease, and whether turpentine he employed or copaiba, it should not be until after the was exceedingly anxious to be under my inflammatory symptoms have subsided, and care, and made berself very unhappy that I presume also that not until then should she was not, and Dr. Tuomson was so creosote be given either.

case is one of poisoning from arsenic in a of organic disease about her, unless the girl aged 22. About three hours before her constantly albuminous state of the urine, admission she had swallowed, intentionally, which had been observed from the time she an ounce of the arsenic of commerce in entered the hospital, made it probable that some beer. Ten minutes afterwards she there might be some disease of the kidneys, became very sick, and on its being discovered, from something adhering to the dually, but no particular affection of the sides of the pot, that she had taken poison, chest or abdomen could be discovered a medical man was sent for, who gave her as medical man was sent for who gave her an emetic, the effects of which having subsided, she was brought to the hospital. Mr. Taylon immediately evacuated the contents of the stomach, by means of the the lower part.

good deal of burning personned a stomach during the night, but on the morning of the e stoniach 14th of September, she was nearly free from pain. She was afterwards ordered to be bled to a pint, for the next morning it appeared that she had suffered a good deal of burning pain in the night. But that had low almost entirely subsided. As she fainted when eight ounces of blood were taken, no more were drawn. The blood presented no morbid appearances. On the 15th she had some pain in the stomacii and bowels, and she felt as if the uterus was falling through slight tenderness. "She says that her her, but on examination by Mr. TAYLOR legand arms feel as if something were no prolapsus or other morbid state could be gnawing them. There was more tenderness detected. On the 10th, the pain was much at the large end of the stomach than at any diminished, and the pains in the head and other part of the abdomen. The tongue back were much less. She said, however, was much furred; the pulse 100 and weak; that the vulva was very sore; though ou examination nothing could be found the matter adopted except that of cupping her between with it, and she was discharged on the 15th, the shoulders, and on the 23rd of September

In the inflammatory stage of gonorrhom, When arsenic has been taken, the first it is necessary that the person should live object, it possible, is fully to evacuate the upon very low diet, and remain as much stomach; but after every particle of the at rest as possible. The greater num- poison may be supposed to be withdrawn, her of cases of gonorrhea become so vio-lent as they are, through the patient's in-quired. Arsenic, like many other poisons, attention to diet on the one hand, or not is a strong irritant to the stomach, and pruresting the body on the other. Walking duces gastritis while it exerts its poisonabout, and especially walking up and down ous effects; and very frequently after all stairs, is most injurious in this complaint, the poisonous effects have ceased, the pand, I believe, that very few persons would tient suffers considerably from the inflamed have a severe inflammatory gonorrhom, if state of the stomach, and bleeding, generally they would remain perfectly still, and take or locally, is absolutely necessary. Somenothing but dilucuts, -at the same time times, after other poisons have been taken, employing such antiphlogistic measures in there is more or less gastritis, recolering the the way of blood-letting as the symptoms lowest possible diet necessary, and fre-require. Cubehs will often arrest the disquently many repetitions of blood-letting,

IDIOPATRIC ANASARCA.-The next is a comparatively but little power; whereas, case of idiopathic anasarca. This was the after the inflammatory symptoms have subsided, copaiba has very great power over the under anasarca, and was under the care of Dr. Thomson. Now the treat-

Mint that it was in a state of disease : but I myself have not had time to make these investigations.

Pericarditis .- The next case had been a well-marked case of pericarditis, which disease was entirely removed before her admission. The patient, a woman, aged 29, was admitted on the 29th of August. At the end of the first week in October, the report at her admission was, that "she had menstruated sparingly, and with great pain, this being the first appearance of the catamenia for seven weeks. A week ago she was seized with difficulty of breathing, pain in the chest, increased on inspiration, and a short dry cough. She had a severe shooting pain in the cardiac region, which went through to the left shoulder and down the arm as far as the elbow. There was also great tenderness over the cardiac region, he kidneys, and these, as I suspected, were on pressing the ribs down hard; and on ound diseased, but only to a very slight de-gree. Very minute granules were seen in up against the diaphragm. The action of the them, nothing like so minerous as are heart became rapid and irregular. There was extreme pain in the region of the liver, the lips were livid, the tongue was brown, and there was globus hystericus. She was appeared to me to be a disease of the sellular | bled three times in the arm. Thirty leeches membrane throughout, like many cases of were applied to the side, and she took the

Now, it is at this period of life-that is to say just before puberty, to the end of the young adult age, that pericarditis principally the pericardium, or pressing up against the pericardium below the cartilages. The acminute investigation with the mi- ment that had been adopted before her aden accurate mode of anato-mission, appeared to me to have entirely removed her complaint, at least so far to have subdued it, that no continuation or repetition of the measures then used were the most perfect form . medical govern necessary. She was in a state of extreme debility, her pulse was 106, but the local symptoms appeared to have given way so considerably, that I had very little doubt that if she was kept perfectly still, and allowed nothing but the mildest food, she would do well. I therefore contented myself with ordering her gruel, barley-water, and a pint of milk a day. Her gums were tender with the mercury which had been given, and her bowels were relaxed; she was therefore directed to take two ounces of chalk mixture after every loose evacuation. The gentleman who treated her before she came into the hospital (Mr. BRYANT), was a clinical clerk here a few months ago, and he seemed to have made the diagnosis with great accuracy, and to have treated her actively and exceedingly well. In fact, in all probability, her life was saved by his treatment. She went out on the 15th perfectly recovered, no medicine having been given to her after her admission, except the little chalk mixture to restrain the action of her bowels.

CASES OF

DISEASE OF THE HEART,

ELUCIDATING CERTAIN

DIFFICULTIES OF DIAGNOSIS.

By John Fosbroke, M.D., Physician to the Ross Dispensary.

"La méthode de l'auscultation à sans doute éclairé beaucoup le diagnostic des malutés du cœur. Elle donne souvent de très-utiles et d'indispensables renseignemens, et on ne doit jamais n'égligir d'y avoir recours. Mais seule, et anns l'aide des autres signes, elle ne pourrait que varement révéler d'une mauvère certaine l'existence de ces nataines, pas plus qu'elle ne pent, dans un très grand nombre de cas, décourrir seule l'existence des tubercles du pounon, on même d'une inflammation aigus de cet organe."—Puo-FESSOR ANDIAL.

Bedders wrote, in 1808, his excellent "Letter to Sir Joseph Banks" on the necessity of medical reform in this country, and pointed out the great strides which the French physicians were making in pathology and other branches of medical science, in consequence of the abolition of the old university schools, and the medical and surgical corporations, by the decree of Aug. 8, 1792, for they were close, illiberal, and corrupt; at the same time recommending, in 1803, the adoption of the present system, which was open, little and anti-exclusive. About that system, which has constituted, as a whole,

the most percess, he have the rence with the Franch in 1807, and the resident the Paris. When they had Lavolsier's, in Paris. When they had formed their establishments anew, he wrote to Dr. Berger, of Geneva, to complete his knowledge of the subject, and also concerning those other universities on the continent which were newly revived about the ime time, "ours alone," as he observes, "standing still, a stupid uniformity being the rice of all old universities." Beddoes (if I recollect rightly the information given by Mr. Higgins, of the Dublin Society, who was his assistant) was the professor of chemistry at Oxford, and he entertained the vain hope, to quote his own words, that " the day when a certain set of notions was to be thrust down the throats of society by mere partypraters, the owners of every monopoly, and their clerks in office," was over, and he proposed to "raise the brows of the parsons, the country gentlemen, and the merchantprinces, in every part of the kingdom," in behalf of medical reform. But Beddoes was driven from the head citadel of monkish bigotry and prejudice, for the premature liberality of his opinions, and taught that the spirit of the English universities might resemble those of France previously to their dissolution; for "the spirit of the univerhe said, "was at variance with the spirit of the age, and the spirit of the body of the universities was at variance with that of many of their most able members. The country was becoming enlightened; whilst those who studied with the intention of becoming public instructors, found themselves, upon leaving the University, where they had been educated, behind the world in many respects, and forced, as it were, to unlearn every thing, in order to commence their education anew. This was a state of things that could not last long, and the catastrophe was hastened by doctrines which, though long in openly manifesting themselves, and though opposed by all the influence of church and state, were not destined to be slow and ineffective in their ultimate progress." * These ancient and venerable institutions were, it is true, destroyed by the revolution, but they had been denounced by public opinion, and the spirit of the age, for thirty years before that event, + and now fell as the natural consequence of the spirit being wrongly directed, and reform not being conceded in time. 2 Beddoes, although, until towards the premature close of his days, influenced somewhat too much by his imagination, was not one of those men who obtain a character by more conning, and the interested voices of incompetent judges, but a man of

al powers and the night of mind. The hap- | were well if no such controversies ever enhas howers and sterngton pines are the mines was tracked the him to survive hose days or the second dominator, when hose days or the second dominator, when i man (to the second graph of Paley) might 18 well have put a rope around his neck as emonstrate against the abuses of catablished nstitutions. But his name remains to draw orth the sympathy which the memory of an old reformer excites. He instances, among the inny illustrious French professors who, elevated by merit, under the influence of reform, retrieved the feeble character of the profession in France, the energetic and talented M. Corvisart. He more particularly ulverts to the perfection at which Corvisart urived in all his discriminations and prognostics relative to diseases of the heart and great bloodvessels. Corvisart constantly brought cases of the most grave and obscure nature before the pupils of La Charité, and, with his scalpel in his hand, ultimately verified those changes which he had predicted. M. Horeau, a contemporary, states, that so astonishing was Corvisart's accuracy in organic diseases of the heart, that two-thirds of the thirty patients in the clinical wards, were admitted upon his bare suspicion of the existence of those diseases; and circumstances proved that he was rarely mistaken in any one of them.

But sure I am, from my own limited experience as an humble country physician, that the discrimination of the precise na-Here of such cases and their complications, and of one disease of the heart from another, is rendered, in many points, not yet quite so easy as the drawing of a line between a kettle and a cartwheel. When I am not working abroad, I am generally studying pretty hard at home; and I can plainly see that practitioners often meet with cases that differ from those regular diseases of the circulating system which are classified by pathologists, and which rather tend to baffle practitioners than to display their discriminating powers, if we judge from their hints, admissions, hesitations, suppressions, and uncertain language, both on the continent and in this country. The difficulty occurs, in practice, in numbers of instances, which never appear in print, and for very good reasons. To look into the heart of man, and detect " the hell that's there," is proverbially difficult in morals, but to pronound the nature of its fleshy maladies, is yet a harder task. For example: What a controversy has there been exhibited in this part of the kingdom between individuals (whom on both sides ! know and esteem) who, on the one side, have insisted that there was organic disease or the heart, and on the other that there was not, in the case of Mr. Bennett, which gave rise to the trial against the Eagle Office at Worcester!* It

sued to expose the fallibility of the profession. When it is admitted that we cannot distinguish between organic diseases and palpitations, in all cases, by the stethoscope alone (Dr. Mackintosh), - that hypertrophy occurs where there is no impulse, which is its pathognomic sign, and that impulse has occurred when there was no hypertrophy, that a plethoric state of the heart may produce the same signs as hypertrophy, -that pericarditis, in particular cases, may be con founded with dilatation (Andral), that time and repeated investigations only can decide whether there exists functional or organic disease of the heart,-when these things are borne in mind, the positive opinion tha organic disease does exist, cannot be made with too much deliberation. On the other hand, knowing that few men die from or ganic disease of the heart alone, but fron morbid action supervening on morbid struc ture (Professor Macariney),-that palpita tions and hypertrophy are only manifester at intervals (Andral),—that simple palpitations, and those palpitations which ar symptomatic of organic lesions, are liable t intermissions (Rostan),-and that active or ganic diseases of the heart are generall suspended for a time, to relapse suddenl and terminate fatally (Professor Home),an equal degree of caution is needful in de nying the existence of organic disease, upo a single examination instituted for the pur pose of filling up an assurance office certifi The advantage may be fairly pre sumed to rest with the parties who had th

I am going to introduce to notice a fer cases of disease of the heart. The two fire are not uncommon, but serve, notwithstand ing, to illustrate, in many points, the tw last, which are more obscure, and therefor more instructive. Many fields of patholog have been so thoroughly mowed as not t present a blade of grass, but this region not so utterly barren. "Where a fact is never exactly like the facts already observed, it is necessary, if I may so speak, to individualize without cessation. In this consists all the art of diagnosis, and it is for this reason that the instructed man who has seen most, is also he who ought to see best." (Andral.) Aware of the great difficulty of discrimination in heart cases, -of the double and exceptional import of the discriminating signs, whether those signs be communicated by symptoms or sounds, -1 submit every point rather by way of query than affirmation, and with the greatest diffidence to the profession. I quote solely the authorities of professors and hospital practitloners (most of whom I have heard) on account of their superior experience, and insert their names in parentheses for the sake of avoiding " he says," and " says he," and " he re-marks," and " he observes," and the like.

most opportunities of investigation.

CASE 1 .- Pulmonary Tubercles, with Dilatation of the Right Auricle, and Sumptoms of Hypertrophy of the Left Ventricle.

Mr. Henry Bellamy, of the Priory Farm, Goodrich, atat. 24, was affected April 27. 1833, with cough, and expectoration of roundly-formed erackets, which had followed the influenza. The cough was attended with symptomatic fever, and was of importance, because it had occurred before, in conjunction with pulpitations, and hemorrhage from the lungs in considerable quantities. After that occurrence his respiration and general powers were always feeble. He took calomel, opium, and James's powder, with an ammoniacum mixture, and after all fever and symptoms of increased action were removed, the Polygola mixture of the French, with Compound Tr. Benz. and Tr. Mur. Ferri. The cough was greatly relieved, and the respiration improved, and he had expectorated only a single clot of blood since the first attack. But excessive nocturnal perspiration came on, which wetted through the bed-clothes. These were restrained, at first, to two nights in the week, and they were gradually prevented altogether by superacetate of lead, with hyoscyamus, mineral acids in his drink, and citric acid with opium; but he still continued to get thinner. By the 26th of May, the cough and expectoration had ceased; he had recovered his general strength considerably, and had rather gained flesh, and he found the seat of irritation not so deep in the chest, but more at "the top of the windpipe." His chest was stimulated externally with tartar emetic, and the polygola was continued, with tartar emetic, ipecacuan., &c., which he never took " without relief of the cough, acting as if it went immediately to the part affected." In June all chest symptoms were removed, except slight cough, and occasional night sweats, but the debility, the shortness of breath, and the emaciation, continued the same. The citric acid, with opium, and extract of myrrh, again removed the sweats, and procured him refreshing sleep and easy expectoration, which had always been attended with violent straining of the lungs in the morning.

He continued to get better until the beginning of October, when he was seized with palpitation, to which he had been subject, at times, for years, previously to the attacks of hæmoptoe, and pain in the left thorax, extending from the bottom of the sternum, towards the spine, and occupying male hysteria. Much disordered nervous the space of a span. This pain, which was more or less constant, came on in an exasperated degree by stitches, and when he back. The cough was frequent, and expec-ioned of the tube, and those of four the toration was considerable, but there was no farmers, who were present. The pain on respiration. The respiration was the left ventricle was below audible at both sides of the chest, but less standard, and the pulse

the mot than at he bottom of the lohes, and it was much a long morous, diselsewhere; the flapping committees of the heart was very clear. I gave him the American remedy for consumption, Tr. Digitalis and Guiac., with Vin. Colchiel, and inserted a seton for the palpitations.

On the 25th October, the palpitation and fever were removed, the former having been greatly benefited by the seton, which he kept in for some time afterwards, but the pulse and general strength were much depressed, and the expectoration was too abundant, for which he resumed the Opium and Citric Acid, with the Polygola and Tr. Lyttæ. He now lay easiest on the affected side, but when he lay on his right side, he had violent stitches, which stopped his respiration, and set him gasping. In foggy mornings he was much worse. He got better again, and enjoyed a considerable period of convalescence, but his lungs continued weak.

Twelve months afterwards (20th Nov.) he was affected with such extreme shortness and hurry of expiration and inspiration, and oppression in the chest, that he could not walk the smallest distance without exhaustion. He had been free from this state until three days before, when a north-easter set in, and he had cough with thick expectoration in the morning, but without pain; wheezing occurred in the night, with in ability to lie on the left side. He had occasional circular tightness of the chest, girting him in at the sternum; less emaciation than three years ago, and swelling of the

But one of the principal symptoms was the very forcible action of the heart. This thumping of the heart came on most violently, with cold extremities, on lying down in bed at night, and shook the bed furniture. He was always purplish in the face, and in his youth he had been apt to turn of a blue or a violet hue in the extremities and face, from any chill of the feet, or from bathing in the Wye. The jugular geivered sometimes at night during increased impulse, but there was no constant turges-When sitting quietly and leaning cence. forwards, the breathing was easy, the voice strong, and the action of the heart not felt. When he walked, the respiration was nortal and stopped almost entirely. He was sometimes relieved, in this state, by tears, for he was subject to a sort of nervous attack, like action, to which the whole family are subject, was blend . with the organic disease. The impulse and so great at the hottom of THE HEART.

pressible i the right himself in the trachea. At the space between the left scapula and vertebrae, pectoriloquy was very distinct, but it was much more jarring, loud, and distinct, over the riet scapula. The voice, however, was naturally resonant. The respiration was dear everywhere, but blowy and schorous.

I now offered an opinion that the right ventricle was hypertrophied, and, from the ound, as well as the impulse, in concurrence with long-standing symptoms, that there was dilatation of the right heart. The hisory of the case favoured the opinion of orranic disease. The grandfather had died of ingina pectoris from ossification of the coropary arteries, and was examined by the late Mr. Paytherus and Dr. Jenner, hence derivng, I believe, the first fact on which Dr. lenner founded the incorrect doctrine aftervards promulgated by Dr. Parry, that angina vas generally caused by ossification of the intritious vessels of the heart. His father was affected with pulpitation and cough, and was conspicuous for venous fulness and purple endency of skin, combined with a nervous and hypochondriacal temperament. One siser is now suffering from irritable heart, with ymptoms partly nervous and partly indicaive of accumulation of blood in the caviics; another is subject to sudden deadness nd purpling of the skin, from slow ci. culaion in the veins of the arms.

ears ago, -that as he had been subject to it and violent action of the heart, more or less, vith weak and short respiration, for the last our years, and had improved in flesh and trength whenever the heart became more ubdued, -- that as the symptoms might arise he same time I could not but entertain erious doubts and apprehensions.

Nov. 24. 1 put him on a diet of hiscuit, ice, milk, and slops, and under the action of ntimony, internally and externally, which wered considerably the action of the heart, ut produced too much syncope in the first istance. He was ordered to refrain from hatever would hurry the respiration or irculation, but so soon as an amendment ok place, he rode to Monmouth Fair, and

tions were audible under pression of breathing; his pulse not strong;
The creptition aste and his respirations 40 in a minute, carried on were heard under the left by the shoulders and muscles of the chest clavicle, and the mucous rale was audible to and abdomen; the body in perpetual agitation; the lips and nostrils empurpled; the mucous rale in the larynx, and extending from the right clavicle down the right chest. Leeches, blisters, sedatives, and antispasmodics, were all useless, except that the leeches smoothed the way to the grave by relieving the dyspuca. It was strange how he would sink, like an hysterical woman, into a semispasmodic state of breathing, and then rally again, and be as casy in a sitting posture as in good health. extended from the right lobes to the bottom of the left and upwards, and after frequent sinkings and reactions he expired on Monday, Dec. 2, at 2 o'clock. On the preceding evening he called up every farm servant, and gave to every man the character for his services which he deserved, pointed out what alterations he intended to have made upon the farm, and discoursed deliberately with his family on their several affairs. remember a female in phthisis, who sent for me to see her die, conversing of it as of taking a journey, until nearly her last breath. There is a philosophy in deaths like these, which may be owing partly to temperament but greatly also to integrity of conduct, and to a nature free from the malignant passions.

Post-mortem Examination .- Mr. Thompson, a gentleman of skill, and surgeon to the Ross Dispensary, examined the thorax with I gave it as my judgment, that as he was me. The right auricle was twice the size of flected with hamoptysis so long as eight the left, but though dilated it was not thickme. The right auricle was twice the size of ened. The columna cornea were very strong, and well defined. The right ventricle was not dilated or thickened. There was much fat about the heart. The primitive vessels were not obstructed. The lungs were firmly bound by old adhesions to the rom chronic bronchitis, - and that as posterior parietes of the chest. The root atthisis rarely takes more than one year to of the lungs on the right side was more on through its course,-the pectorilogue purple and soft than on the other. They night chance to proceed not from thereu- were considerably occupied with gray tution existed whereahouts they were thickest. There were two cavities, one on each side of the spine; that on the right side was nearest to the posterior wall of the chest, which may account for the greater loudness of the voice from that point. There was no particular appearance in the bronchial tubes or membrane, except a frothy oozing from the smaller tubes.

Remarks. - The most singular circumstance in this case, is the fact that there as sezed with such a fit of dyspuces and was every symptom of hypertrophy of the tordinate pulpitation, that he burried to right ventricle, but no other organic affecexpands, threw himself into a chair, and tion than simple dilatation of the right authis arm on a table with his chest ricle; but it will be more in order to notice was somewhat recovered. in the first place the origin of the disease.

I cannot reflect upon the circumstances and rest open the circumstances showing a tendency to pulpitations and heart affections in the family of the patient, and aymptomatic. All pathon upon the early manifestations about the nervous and symptomic heart in his own case, without seeing in the among whom are Rossan. case something like a predisposition. M. Rostan says he has opened a thousand individuals with hypertrophies of the parietes of the heart, and has never known a case of hypertrophy or of aneurysm, that is, active dilatation of the heart, which arose, in a primitive manner, from an hereditary or acquired disposition, but that he has found invariably an obstacle to the course of the blood, and that hypertrophy without obstacle, is merely exceptional, and barely possible. The present case was certainly not one of dilatation by predisposition alone, without obstacle, for the phthisis itself was the obstacle, but I infer disposition, from the history of the case, and I cannot conceive how, if the heart be not influenced by original tendency to disease, the same obstacle should so often occur without that organ professor of La Salpetrière says, that the obstacle, and not the hypertruphy, is the disease. Wherein is the obstacle in those cases of hypertrophy by congestion, which, the country. Dr. Parry also thought that chial capillaries. (Audral.) exercise mcrely.

tion; simple nervous, simple plethoric, and rated. Induration of the pulmona

but few, and Drs. Parry and Macintosa, somit the plethoric and congestive. For my part, I think that the first two, and sometimes all three, are blended (but more on this head in an express paper), and I think that the nervous and congestive were united it This case; or, in full, that original nervous irritability of the heart was combined with a liability to undue accumulation of venous blood in the right cavities, particularly on the contraction of the vessels upon the surface of the body. The symptoms and proofs of a nervous temperament in this case, - the coming on of the palpitations at night in the greatest degree .- and the fact, as we are told, that all palpitations not arising from organic but functional disease of the heart, more frequently affect the auricles than the ventricles, and the right auricle more than being affected. The experienced and acute the left,*-stamped the nervous character upon them. But though the occurrence at night is said to be characteristic of nervous palpitation (M. Laennec and Dr. Macintosh), the increase of action and of impulse of the according to M. Andral, arise from in-right ventricle upon the contraction of the creased assimilating powers of the part, surface circulation, and the crowding in of and a greater deposition of atoms than are absorbed into the circulating medium? That occasions of chill, gave to the case also the consummate pathologist moreover has given mixed congestive character. As there was a case of dilatation of the right ventricle, an obstacle in the lungs, so were they in a and hypertrophy of its parietes, without ob | measure symptomatic. It may happen, geneand uppersophy of its parietes, without on incessive symptomatic. It may happen, generative the auriculo-ventricular orifice, or rally speaking, that nervous palphtations are any other lesion, after inflammation of the pericardium and bronchial membrane,* and palpitations, arising from hypertrophy also, a similar case of simple hypertrophy of left ventricle, after latent pericarditis without tended with interruption of rest, as in the obstacle. When the properties of the advanced with interruption of rest, as in the obstacle. Wherein, again, is the obstacle case of simple nervous palpitation. In adin those cases of dilatation which arise dition to palpitation, the patient was next from congenital disproportion of the two affected with hamoptysis, and subsequent parts of the heart, - according to M. cough. Hemoptysis is a well-known effect Lacennec, the "most frequent cause" of of congestion of the lungs produced by paldilatation? Mr. Henry Cline was of opi-pitation, dilatation, or hypertrophy of the nion that the heart grew under diseases, right side of the heart, and is most frequent which rendered it liable to congestion,—and when caused by hypertrophy of the right that the greater quantity of blood pouring ventricle. The affection consists generally through it in those who are in the habit of in what MM. Corvisart and Lacennec term taking violent exercise, had a tendency to pulmonary apoplexy by congestion and increase its size,† an opinion considerably hemorrhage from the bronchial membrane, strengthened by the frequency of diseases or, as some pathologists state, by transudaof the heart in our labourers in this part of tion and exhalation from the minute bron-

there was a connection between dilatation, and accumulation of blood in the heart, tion, for the augmentation of the heart's aorts, and right pipe. Others think that volume, in complication with phthisis, conthe heart may hypertrophise, like the pugilist's or blacksmith's deltoid, from increased right cavities, with or without hypertrophy of the parietes, and seems to depend on the Occasional palpitations were the earliest obstacle experienced by the blood in favers symptom in this case. Authority and oh- ing freely the vascular structure of the lungs, servation point out three kinds of palpita- which is often, to a certain extent, oblitestance, stricture, obstruction

of the palests, artery or vessels of the served these symptoms, the existence of a interior of the first of the control of the circle of the c fection of the heart is slight, symptoms, but little marked, announce it during life, and auscultation may at most but recognise its existence; when more considerable, the symptoms may be more characteristic.

Auscultation is peculiarly fallible in these complications, for in a certain number of cases, the great extent of the heats of the heart does not indicate a morbid state of that organ, as they result uniformly from induration of the pulmonary structure, in which they may be extended with force under one or other clavicle, and it may be, in some individuals, even to the back. (Andral.)

The progress of the case also indicated dilatation. The palpitations were at first moderate, and occurred at longer intervals, the close the character of asphyxia. pulmonary artery into the lungs, than could ties; but there is a continual tendency to that change till it is effectuated, and all the causes, moral or physical, which produce any difficulty whatsoever in the circulation. singularly hasten the production of dilatation. But whilst the palpications are absent, the application of the hand or ear to the precordial region, will not discover anything unusual in the heart, and so long as there is no anenrysm, the pulse also will be case given.

The violet circulation, with disturbed respiration, formed a third indication of dilatation. Swelling of the face and violet discoloration of the lips, impossibility of horizontal decubitus, irregularities and intermittences of pulse, are so many symptoms that coincide with pulmonary phthisis, but do not depend on it. They announce an

The jugular turgescence during the more violent attacks of dyspnœa and palpitation, presented a fourth sign of dilatation of the heart and pulmonary congestion. The livid or violet tint, as in asphyxiated persons, which occurs in people with very troubled respiration, and in dilatation of the heart. is the effect of a want of equilibrium between the quantity of air entering the air-cells, and the quantity of blood to be vivified. If more blood than in the normal state is accumulated in the pulmonary vessels, a greater quantity of air is necessary in a given time. and consequently there is a sensation of oppression, and a drawing together of the inspiratory movements, which shows the introduction of an excess of air, and the opposition of some cause to the free passage of blood through the pulmonary vessels, prewith oppressed breathing and tubercular ceding, therefore, any other sign of the exirritation, but were on the whole slow; at istence of organic disease of the heart. In last both the palpitation and dyspnæa be- a further stage, all efforts are insufficient to came more formidable, and assumed towards | modify the whole of the blood accumulated It in the lungs. The blood, already changed, seemed to me that through the more irri- can no longer pass freely into the left cavitable state of the right side of the heart ties of the heart, whence reflux and stagnathan of the left, and its undue action, more | tion, and a new obstacle to the pulmonary blood was hurried, in consequence, by the blood in the right auxicle, great venous trunks, and parenchymatous tissues. When be received and circulated at an equal rate the veins bring back, more or less directly, by the left heart. Palpitation and dyspnora the blood towards the heart, there occurs may be manifested a long time, without any the greatest difficulty of respiration, then material change in the thickness of the increased asphyxia, and then, notwithstandheart's parietes, or in the caliber of its cavi- ing, the air enters freely into the vesicles, the feeling of suffocation, from the quantity of inspired air not being in proportion to the mass of blood.

But these symptoms are not unequivocal proofs of dilatation. Stasis of blood in the left auricle and lungs, dyspnera, cough, previous hamoptoe, and violet discoloration of the lips, face, and skin in general; stasis in the right ventricle and anricle of the same side. and all the venous system; are part of the natural. (Andral.) - All these phenomena leading symptoms, towards the end of an strictly accorded with the progress of the hypertrophy, arising from an obstacle of the aortic valves or thoracic aorta, before or after the giving off of the subclaviaus. (M. Rostan.) Besides, one of Laennec's tests of hypertrophy of the left ventricle is jugular turgescence. (Dr. Macintosh.) Dilatation may also be confounded with particular cases of pericarditis. There are certain forms of inflammation of the pericardium which influence the movements of the heart aneurysmatic state of the central organ of in such manner that a disturbance of the the circulation, that is, an augmentation of circulation results from it, giving rise to the its volume. With many phthisicals we have same phenomena as those observed at a charryed such a suffocation, that they were certain period of aneurysm of the heart. to keep themselves sitting up in their (M. Andral.) This authority gives a case of latent pericarditis, in which there came on, the overwhelmed them, all of a sudden, extreme dyspnon, increasing in intensity till it produced death by asphysia. The p.-m. appearances were, scrous tion could co-exist with increased impulse effusion into the pericardium, and simple by of the left yearricle of the heart, perfuphy: but though a perfuphy was without obstacle, which had been marked but evinced by this its sign, dilutation only was by slight impulse. He gives another ease discovered post morten, and the violence of monia. The oppression and dyspacea be- right ventricle were produced by the temcame more considerable, and all the symp-porary condition of the circulation of that toms of consumption were complicated with side of the heart and of the lungs;—that the those of aneurysm of the heart; the face ten iency to hypertruphy, produced by obcases of obscure pericarditis without pain.

logical opinion.

Abernethy used to term it, against the and conditions, in equivocal cases? sternum, in this case, could not come of sinple dilatation; for though dilatation renders with this subject that ought to be home in the patient more liable to sudden attacks of mind. One is, that organic affections of the palpitation and dyspuca than hypertrophy heart, accompanying chronic heorichitis with (Dr. Macialosh), the palpitations are at- considerable oppression, may be consecutive tended, not with increased, but diminished as well as primitive, and that organic disimpulse, with purple countenance and swollen jugulars. (M. Martinet.) I do not know that I ever saw or read of a case of simple dilatation in which the pulsation of the heart was not more feeble and more extended, except a case given by M. Andral, in which the contractions of the heart were more seusible at the inferior part of the sternum than at any other part, with a particular bruit: the only lesion was an enormous dilatation palpitations occur in pacamonia, pathisis, of the right auricle, with slight hypertrophy accidental formations in the lungs, or in the of its parietes. I also know that M. Laennee, tract of the great vessels, as in all other and others have considered that this shock, or impulse, cannot arise from simple palpitations, and that it is the distinguishing think they often arise in phthisis from symptom of hypertrophy. Knowing these contiguous irritation, and flatonial things, and that dilatation at all events ex-seted, I could not conceive how that dilata-bring on tightness and

of pulmonary phthisis, in which the patient the impulse was owing to mere palpitation, was seized suddenly with troubled respiration,—accelerated respiratory movements,—that the control of the control was puffed, the eyelids were a little infiltrat-structed circulation, had not existed long ed, and the lips were swollen and violet, enough to superadd the change of structure The left ventricle was slightly hypertro- to the change of action, as happens in some phied; but the real disease turned out to cases in which the symptoms of dilatation be pericarditis, without pain. He very reasonably thinks that the aneury-in did not existed long enough to produce the internal exist, merely because it could not have been hypertrophy which will sometimes ensue in formed all of a sudden. Some similar pine phthisis, notwithstanding the tendency of nomena characterize one or two other of his the heart in that disease to participate in the general diminution of the muscles of animal life and the general atrophy (M. Andral):-All these signs that "palter with us in a that, as aggrandisement of the heart's subdouble sense" exhibit the great dubiousness stance may exist without aggrardizement of doubte sense earning the great due to state and earlier and earlier and the weighing every individual symptom, and the history of a case; and then taking the transfer and the tracking of the court will not produce impulse without inverse and them taking the contractile energy of its fibres, particularly the court will not produce impulse without inverse and contractile energy of its fibres, particularly the court will not produce the court of the court without inverse and contractile energy of its fibres, particularly the court will not produce the court of the court will not produce the court of the court of the court will not produce the court of the court o time for the further lifting up of the veil, be-fore we presume to give a conclusive patho-culation is slow, so increased impulse may arise from an increased volume of blood and The peculiar circumstance in this case increased activity in the cavities of the heart, was the presence of the signs of hypertro-without increased autrition of its subphy, without its existence. We are told that stance; - and, lastly, that impulsion, as is the principal symptoms of an hypertrophy admitted by M. Andral, Dr. Macintosh, and of the right ventricle are, "a shock against others, new be produced by more polpitathe inferior part of the sternum, and much then in a vident degree, and cannot conseless at the left, the general circulation little, quently be set down as an unexceptionable changed, and some phenomena of pulmo-nary congestion." (M. Roston.) I know Should we not then always shape our opi-that the shock, or "thumping," as Mr. nions subject to these important exceptions

There are two circumstances in connection ease of the heart may produce chronic brouchitis, and, by congestion and distention, hemorrhage of the mucous membrane, and those muco-serons accumulations in the air passages and vessels which increase the dyspnosa, augment the pulmonary congestion, and set the affection of the heart on the quick march. (Audral.) The next cir-cumstance is, that common symptomatic maladies, near or remote, which produce an obstacle to the circulation. (M. Rostan)

sternum, and increase the irritation of came under my care in Dec. 1833, and died

The cases James Dean, 48, at Ross, was an example of their coincidence with accidental formations. About four years ago, after an attack of hamoptoe and cough, preceded by palpitations so violent that they shook the watch that hung over the bed, and compelled him to tie a shawl round his waist to prevent the impulse, he coughed up a solid earthy concretion as big as a nuturug, which, he says, is now in the possession of Dr. Thomas Evans of Gloucester. He has been under my care for dyspinea, evidently connected with fulness of blood in the right side of the heart and chest, consequent on engorgement of the liver. which is a frequent precursor of such affections. " Palpitations are known by the absence of the signs that accompany diseases of the heart," says M. Rostan. They are so in these cases, but not in such a case as I have given, nor in many others.

The diagnosis of pulmonary tubercles was as obscure in this case as the precise condition of the heart; they were probable from many symptoms; from the readiness of the lungs to become irritated to such a degree as to bring on coughing; the long confinuance of the cough after the attack of hemoptoe, and the persisting debility and wasting of flesh. But there was no dull sound on percussion, no absence of respiration in one spot or another, though it was certainly blowy and sonorous, which is said to indicate crude tubercles, surrounded by healthy structure; nor was there the weakness of murmur which generally occurs in the second stage of phthisis; the complexion was purple; the peaked and white face of consumption never made its appearance; the night sweats were common to himself and others of the family, from having irritable and nervous constitutions; besides those sweats, marssmus, and short and frequent breathing, are as common to chronic bronchitis as to phthisis; the catarrh of phthisis, which resembles ordinary bronchitis till the cite sufficient constitutional irritation to tubercles become so numerous as to create a new set of symptoms (Laennec), marked the real disease. The pectorilogue discovered towards the close, at a point where resonance only was perceptible, about a year or more before, rendered the diagnosis more right heart and lungs. M. Andral advocates unequivocal. We have cases of bronchitis decisive emissions of blood, when pulmonary mistaken for pulmonary consumption, the congestion and oppression ensue from dilaonly difference being the londer respiration tation; but, in other places, he demonstrates and resonance of the voice. (Dr. Macintosh.) that cases of dilatation do not bear blood-let-It is difficult to say whether the occasional ting well, and require a tonic treatment. It is pains of the chest were owing to muscular condemned by every other leading authority, affection, or depended on the formation of except under particular emergency. In this tubercles in the lungs; but in the latter case, the patient had suffered a so deadly

in 1834, and I fear I shall have another such case in Thomas Jones, ætat. 35, who has had ha moptoc, with disease of the mucous membrane of the alimentary tube. These are cases, says the celebrated teacher in the school of medicine, in the true spirit of medical experience and clear-sighted induction from facts, in which phthisis makes its debut very obscurely, in which the appearance of the first symptoms always succeeds a simple bronchitis, hamoptoe, or peripneumonia. Some present pneumonic, others bronchitic symptoms, but when convalescent they never recover their general powers, nor their em-bon-point, and they continue to cough. The diagnosis of tubercles is obscure, because the cough, the only local symptom which exists about the chest, does not suffice to characterize them, and the absence of strength, and the persistence of the leanness, are looked upon as connected with the antecescut malady.

If this state continues for ever so little, it should inspire a strong suspicion of organic lesion, and if the cough does not cease, the development of pulmonary tubercles is to be apprehended. It suffices to say that this cough ought not to be neglected, and the cure, as is too often the case, ought not to be abandoned to nature. Many dread the employment of active antiphlogistic treatment, because, say they, the subject is en-teebled and exhausted. But this feebleness, this exhaustion, depends, above all, upon the serious change which is forming in the lungs, and it is only by combatting this change that you can restore some strength to the patient. "An actual convalescence is almost never accompanied with this prolonged state of feebleness, and the rapidity with which strength and flesh return in individuals who have been kept a long time on severe regimen, provided no organ continnes diseased in them, is a thing truly remarkable." (Andral.

A moderate number of tubercles will exdestroy one patient, while another will live out the destruction of one lung. But I do not think the tubercles were so much the immediate cause of death as the oppression of the circulation and respiration in the deutic inflammation, and cause those of dyspuces and oppression, under previous hands to mine, that he had an instinctive the lungs. This case to it. He was placed between two fires and bleeding could only add to the debility in which there existed alarms, most evident of one or other disease, either of which was signs of dispepsia, of nine and the standing, sufficient, and one sure, to destroy him. (He have been completely cured. I third case, might have lived longer, had he been shut up in one room, in an artificial and equal temperature, and compelled to perfect repose of body and mind. But his active disposition rejected this plan, and by hurrying the circulation through the cavities of the beart and the bronchial structure of the lungs, he no doubt brought on the last and fatal attack. Exercise, in disease of the heart, will oring on severe dyspnæa and a feeling of suffocation, but, on the other hand, all affections of the lungs, which give rise to longcontinued and severe dyspnora, and habitually short and difficult respiration, and a feeling of oppression, may occasion palpitations and affections of the heart; and all causes, that upset the balance of the circulation, and produce an overflow of blood about the heart, may excite this class of affections, (Dr. Macintosh.)

I have reported this case, and reasoned on the symptoms at length, for one such case is a representation of a whole family, and supersedes the necessity of another of the kind. Such cases are not unfrequent, and a knowledge of them is very useful to the practitioner.

Ross, Nov. 14, 1835.

ON THE TREATMENT OF

PULMONARY CONSUMPTION

BY THE

INUNCTION OF LARD.

To the Editor of THE LANCET.

SIR,-During the last fifteen months I have experimented upon the effects to be produced on cases of phthisis, by administering nourishment through the skin, and with very evident success

My practice consists in simply causing the patient to rub in for half an hour every day upon the chest, back, and ribs, or on any other large surface, as much lard as can be absorbed in that time. In very advanced cases, this operation is repeated as often as three times a day. At the same time any urgent symptoms are combatted with the of stimulating the nutritive functions, ordinary remedies.

The effect of this treatment is, I find, to stimulate the nutritive functions of the body, will point out to him. For my own pant my increasing rapidly the patient's strength; experiments lead me also to think, that is to quiet the action of the heart, to allay exerts a marked control over scrolabour pain of the chest, and to remove difficulty of action. breathing. These effects are made apparent in fifteen or twenty days, and even carlier.

Out of four very severe cases of phthisis consumptive cases, was a which have been submitted to my care; two health generally enjoying

catarrhal, with tubercles, remains yet in doubt. The fourth, tuberculous, and complicated with dilatation of the cavities of the heart, a case of two years' standing, is progressively and evidently improving. In the third of the above cases, the patient, a lemale, was weighed on the 15th of October, when her weight, including clothes, was found to be \$3 lbs. She then commenced rubbing in the lard, and on being weighed on the 10th of November, she had gained seven pounds, and this increase of weight she has maintained up to the present date (November 21), weighing on the morning of each day, 87 or 88 pounds, and at night invariably 90.

A friend of mine, also a medical practitioner, has likewise made trial of my plan of treatment, upon what, in his opinion, was a hopeless case, of nineteen months' standing. The cough and expectoration have now nearly subsided under it, and the breathing and strength are restored. I am promised a detailed account of this case. which I hope to transmit to you, in a short time, as also that of other cases now under treatment; and whatever may be their result, whether they terminate in perfect or parcial convalescence, that result shall be faithfully recorded.

My immediate object in giving this hasty notice at the present time, is to invite those of my medical brethren who have hospitals under their care, to aid me in my experiments, by giving the treatment a trial Any professional communications bearing upon this subject, sent to me free from expense, whether in favour of or against the plan, would be esteemed an obligation; as upon a subject of so much importance, and leading to so much general benefit, it is very desirable to accumulate a body of facts, verified by the observation of others. Cases not far advanced have certainly appeared to yield with the greatest readiness to this remedy. But to the profession generally, I look to confirm or destroy my hopes of having discovered something in the shape of a remedy for this reproach to medical science. The plan has this advantage, that it may be combined with any other mode of treatment the practitioner wishes to employ.

What other forms of disease this power through the absorbent surfaces, is capable of combatting, every practitioner's experience

In conclusion I may state, th me to try the inunction

constant occasing to handle field, combined without the slightest benefit, and the vomitwith the adapted fact, that butchers ing being not only the most troublesome and their factors are remarkably exempt aymptom, but precluding all possibility of from that disease. faithfully,

EDGAR ASHE SPILSBURY, M.R.C.S. Walsall, Staffordshire, Dec. 7, 1835.

TRIAL OF CREOSOTE

IN SPASMODIC AFFECTION OF THE STO-MACH WITH VOMITING.

To the Editor of THE LANCET.

SIR,-The following case, illustrative of the non-efficacy of creosote in allaying spasorgan), is transmitted for insertion in your obedient servant,

JOHN WALKER, M.D. 353, Argyle-street, Glasgow.

pages 275 and 276, Dr. Elliotson relates one twenty drops of solution of mur. of morphia, case of neuralgic pain of the stomach, and when the symptoms induced were as violent two of severe vomiting, so successfully treated with creosote, that in one of the latter cases it was only necessary to exhibit cine a fair trial, it was again omitted for the medicine once; and in the other the adminiscration of a few doses checked the neither vomiting nor pain of stomach was vomiting, which had continued for some time, producing its usual effects of debility, six hours. The second dose produced vio-&c. From the very high esteem with which lent and immediate vomiting, with severe Dr. Elliot-on regards this medicine, I was pain of stomach. inclined to try it in the following case:-

Case. - A.B., etat. 22, an unmarried female. acute pain along the whole spinal column, at intervals. It was not increased by presgreatly increased on motion or pressure, and accompanied by two lateral curvatures, describing, in all, the letter s, and including all the dorsal and lumbar vertebra. There is no paraplegia; the uterus, bowels, urinary organs, &c., perform their functions regularly; the skin generally feels natural, and there is always some degree of appetite. Among the numerous symptoms under which this patient labours, the most distressing is constant vomiting of all ingests, of whatever temperature or kind, and generally from two to twenty minutes after they have been taken. This vomiting of food is attended with considerable pain; but frequently violent retching takes place when no food has been taken, and which is attelled by violent spasmodic pain of stomach, generally continuing from twelve to twentyar hours after the retching has ceased.

avery justifiable means had already

I remain, Sir, yours improving the general health, and as no-thing had hitherto tended in the slightest degree to check it, I felt inclined to try the creosote. It was, therefore, given according to Dr. Elliotson's plan, in doses of two drops in mucilage and water every six hours, but without effect. Next day it was increased to four drops, and in this quantity the first dose produced headache, and increased the vomiting and pain of stomach. The same quantity was again exhibited at the end of six hours, which only aggravated the former symptoms, and a short time after the administration of the third dose the headache became agonizing; countenance flushed, with great heat of surface; retching and modic or neuralgic pain of the stomach and pain of stomach very severe. It also acted voniting (without inflammation of that powerfully upon the bowels, producing six watery stools the first hour, with severe very able Journal, by, Sir, your most griping, likewise inducing painful micturition, and imparting to the urine a strong creosotic odour.

The medicine was now intermitted for twenty-four hours, and again commenced in In the 9th number of THE LANCET, at the same doses, but in combination with as formerly, with the exception of the diarrhea. Being still inclined to give the meditwelve hours, and afterwards exhibited when present, and in doses of only one drop every

Now as Dr. Elliotson says, "This was a case merely of spasmodic or neuralgic pain Has for the last three years complained of of the stomach, not constant, but occurring sure or hot ingesta." There was no pain after taking food, but merely a sensation of uneasiness until the offending aliment had been rejected, thereby leading me to suppose that there was no inflammation of the stomach, and inducing me to try the creosote, from Dr. Elliotson's representation of its beneficial effects in such cases. I found it not only failed to allay the vomiting and pain of stomach when present, but actually in small doses inducing them when they did not previously exist, and also producing other symptoms, which, in this case, would alone have induced me to lay it aside.

Many will at once exclain that in this case, the vomiting arose from the affection of the spinal column and nerves, and I do not deny but they in part did stand in the relation of cause and effect; but as the spinsl irritation and pain were subject to frequent and severe exacerbations, which ed to for the alleviation of the did not at all affect the vomiting, and as the which in this case arises retching was frequently worse when the of the ligaments &c.) back was comparatively easy, we are quite justifiable in concluding that the vom tings from the accordance of the concluding that the vom tings from the accordance of the concluding that the concluding the conclud period of three years. I am inclined to suppose (particularly as there is no appearance of organic affection of the stomach) that the irritation of the spinal nerves was, in the first instance, the cause of vomiting, and afterwards, that irritation being partly subdued, but the stomach still being accustomed to be relieved of its uneasy sensations by regurgitation, constantly recurred to this method, requiring for its suppression moral and physicial efforts more powerful than this patient seemed capable of exerting.

At the same time that this case illustrates the length of time which a person may live, with only occasionally retaining a small acts as a laundry woman for a most respectportion of food, it clearly proves that ereo- able family in this town, where her husband sote, like all other remedies, will fail in checking vomiting and pain of stomach without inflammation.

PURULENT URETHRAL DISCHARGES IN CHILDREN.

To the Editor of THE LANCET.

SIR,-You will probably think the following cases of sufficient interest to obtain a place for them in your Journal. I am, Sir, yours respectfully.

WILLIAM MOSS. Windsor, Dec. 5, 1835.

I was requested last month to see a little girl, three years of age, residing in Eton, whom I found suffering under every symptom of gonorrhea. She had swollen and inflamed labia, a thick purulent discharge from the vagina, and acute pain in passing the urine. On making inquiry, I uscertained that the eldest sister, who was eleven years old, had, in the preceding June, been affected in the same manner; and that the second sister (eight years old) had also, a few weeks afterwards, been in precisely the same state: the mother had neglected to obtain advice for them, as she fancied that the symptoms arose only from weakness, and the discharge therefore had continued on them in a slight degree up to that time. Two days after this visit I was desired to look at the grandmother, a woman aged sixty-six years, living in the same house, who was afflicted with one of the most frightful attacks of purulent ophthalmia that I ever beheld. About three days afterwards, the brother (aged six years) of the girls was affected with swelling and inflammation of the prepuce and glans penis, accompanied by a profuse discharge and pain in passing his urine, which symptoms continued to be very severe for some days. I had seen several cases of inflamed prepuce in children, pelvimeter, gave two such

cleaniness at least ? could trace the disease to no other, but I had never seen cases so decidedly marked, and of so infectious a nature, as the present.

There is no reason to suppose that these children had been infected from any venereal source, but it is probable that gong-rhosa may be generated in the genitals of the human female without any intercourse of the sexes, and, as I believe, without the communication of any specific virus. The parents of these children are very industrious, and, for their station in life, very respectable people. I have attended both at different times for several years; the mother has long lived as butler, always sleeping in the house; the mother has had no vaginal discharge or uterine affection. The eldest and youngest child have slept constantly with her for a long period. The other two children sleep by themselves. They have all been washed and dried with the same towels. The grandmother has had lencorrheea upon her for many years, which bas been suspended during the ophthalmia. She has had the use, I am told, of a towel exclusively to herself. Having simply stated these facts, I leave others to draw from them their own conclusions.

C.ESAREAN OPERATION,

PRACTISED WITH SUCCESS, BOTH FOR THE MOTHER AND THE CHILD.

By Professor STOLTZ, of Strasbourg.

JEANNETTE LIALF, twenty-six years of age, has been affected with rachitis since her infancy. At the age of ten she suffered from a severe attack, accompanied by convulsions, and followed by paralysis of the tongue. Since that period her growth has been completely arrested. She now measures only forty-four inches; from the summit of the coccyx twenty-six inches from the latter to the heels eighteen. Her head is very large, and disproportionate to the rest of the body; the spinal column is quite straight, and the chest well formed; the pelvis, though well formed, is very small; the limbs are curved.

This girl menstruated at the age of seventeen. On the 12th of November, 1834, she presented herself at the hospital of Schabourg, being eight months gone with child. An examination was immediately made, the vagina found to be short and next The antero-posterior diameter of measured with the finger

undus uteri assemble to the shift assemble and the movement of the child assemble that it was a state and healthy.

It resulted from this examination that the women could not be delivered at term, without the aid of a dangerous operation. In the night of the 19th of December the patient was seized with pains in the loins andlesire to urinate; labour-pains soon set in, and mucus tinged with blood was dis-charged per vaginam. The toucher showed that the neck of the uterus was effaced; its orifice was directed backwards and to the left side; the child's head, pretty large, was felt behind and above the pubis. At three o'clock p.m. the pains became more severe; the os uteri was now directed towards the centre of the pelvis, and very much dilated; the membranes became tense at each pain; the head occupied the same position.

Before deciding on the measures to be adopted, Messrs. Erhmann and Stoltz (the author of the paper) wished to introduce the whole hand into the vagina, in order to explore the pelvis with more care. The narrowness of the parts, however, did not permit the introduction of more than four fingers. The impossibility of a natural delivery being now evident, and all other means being judged insufficient, the cesarean operation was decided upon; the woman consented, and on an exploration being made for the last time, it was found that the os uteri was dilated nearly to the size of a crown piece; the membranes intact; and that the head of the child, having glided off the pubes, occupied the inlet, but a very small portion of the cranium projected into the cavity of the pelvis. The child was still alive.

Operation .- The patient being placed horizontally, and everything prepared in the usual manner, M. Stoltz having ascertained that no portion of intestine lay between the uterus and abdominal wall, made an incision along the linea alba, commencing two inches and a half above the symphysis pubis, and extending two inches and a half above the umbilions, which lay at the left side. The fascia transversalis and peritoneum being thus exposed, the operator seized them with a pair of common forceps, near the centre of the wound, and made an oblique opening, which gave issue to a little serosity; a concave probe-pointed bistonry was now introduced through the orifice made, and the peritoucum divided upwards and downwards along the whole extent of the original incision. In spite of the attention given to keep the abdominal parietes closely applied upon the uterus, a small portion of the intestine protruded at the lower chut was easily reduced. In order to whether the uterus had ro-lines. M. Stoltz slipped his the wound, and

Fiving ascertained that this was not the case, he immediately commenced incising the anterior wall of the uterus, slowly and by layers; the uterus here was about five lines thick; the last layer ruptured and exposed the membranes; the opening into the uterus was now enlarged, by gliding the index finger between the organ and its contents, and conducting a bistoury on the finger; before rupturing the membranes every care was taken to prevent the passage of the liquor amnii into the cavity of the abdomen. On opening them, from three to four ounces of water came away, and the fectus was immediately extracted by the feet.

The child, a female, began at once to cry; was strong and vigorous; eighteen inches long; weight five pounds and three quarters. The vacuum which now followed the uterine contractions rendered protrusion of the intestines, and effusion of blood, &c., into the abdominal cavity, imminent; these accidents, however, were fortunately avoided, and some minutes allowed to pass before the extraction of the placenta; this being done. the uterus retreated at once into the pelvis. a portion of small intestine at the same time protruding at the lower angle of the wound; this was easily restored, but in reducing it, a portion of epiploon became engaged in the upper angle, though here the wound was carefully compressed by a sponge. The epiploon was in turn reduced, but this being done with the fingers a little roughly, gave rise to such violent contraction of the dia phragm, with hiccup, as to threaten at every minute the expulsion of the whole content: of the abdomen; the hiccup gave way, how ever, on the assistant's acting more gently and the edges of the wound were nov brought together exactly, by four points o suture · strips of sticking-plaster, two inches broan and three feet long, were passed round the body and crossed over the wound and the whole was retained by bandages The operation lasted from twenty-five to thirty minutes.

The accidents which declared themselve: immediately after the operation, were long and stormy, and for a considerable time gave rise to the greatest inquietude; they are described most minutely, hour by hour day by day, by the author; but as they con sisted in the means generally employed for combatting irritation and inflammation, we do not think it necessary to reproduce then here. On the thirty-second day after the operation the patient left her bed for the first time, during an hour; on the thirty fifth the wound was completely cicatrized and on the 70th the menstrual discharge re appeared. The child, which continued to enjoy good health, was given to a nurse.— (French Gaz. Med., Nov. 21:)

Memoirs of the Royal Academy of Medicine, Paris. Fasciculus 1, 1836.

WE have just received the first Number for the approaching year of the Memoirs of the Royal Academy, but we fear the following enumeration of its contents will prove that the Committee of Publication have not been very happy in the selection of materials. The memoirs selected are .-

- 1. A Notice of the Plague of Moscow in 1771. By M. GERARDIN.
 - 2. A Memoir by Dr. Govraud on

INGUINO-INTERSTITIAL HERNIA.

Under this name the author describes a species of hernia, long known as "incomplete hernia," but never studied with precision. The viscera pass out from the abdomen through the superior orifice of the inguinal canal, or through an abnormal opening in the fascia transversalis, and instead of traversing the canal, to appear at its external ring, they become lodged in the canal itself, which they dilate, and in the neighbouring interstices of the abdominal parietes. Inguino-interstitial hernia, then, has its scat in the inguinal canal. When voluminous, it may extend towards the spines of the ileum, separating the inferior fasciculi of the small oblique or transverse muscles, from the fascia transversalis; it has two complete membranous coverings, viz., the sac and a prolongation of the fascia transversalis. The cavity in which it is lodged is formed anteriorly by the aponeurosis of the great oblique muscle, and the inferior fasciculi of the small oblique; posteriorly by the fascia transversalis; inferiorly by the reflected edge of Poupart's ligament, from which the fascia transversalis arises, and above by the lower edge of the transversalis muscle and a few fibres of the small oblique.

The cavity containing the hernia has two orifices; the one communicating with the abdomen is the internal ring; the external ring forms the external orifice; the neck of the sac is embraced by the abdominal orifice of this cavity. In old hernia, its external (?) surface adheres strongly to the edges of tumour formed by the effused blood de an contracted adherences together, and hence of sac of cellular tissue. The small would arises a well-marked thickening of the neck in the artery is distinct. A small of of the sac, which presents internally the lonated congulum indicate appearance of a defined ring. The hernia occupies. If we cut

may send fawards a pushespation through the impensal ring, and the formed of two parts, one contained to the inguinal canal and the neighbouring part of the abdominal wall; the other situate in front of the inquinal ring, or even in the scrotum. Mr. Lawrence describes a case of this latter kind. Finally, it may happen that the lesticle is arrested in its passage through the inguinal canal, the serous envelope continuing to communicate with the peritoneal cavity. A portion of intestine may become engaged in this sac, and thus form a true congenital hernia in the inguinal canal. Of this rare case the author gives an example in his second observation.

The third memoir selected, is on the effects of corrosive sublimate in the preservation of wood, and on the effects of this substance on the health of sailors. By M. KERAUDREN.

The 4th memoir is entitled, "Observations on the Cure of Wounds without Inflammation. By James Macartney, M.D." These consist of a few insignificant remarks on the eternal subject of waterdressing. It is to be regretted that principles which in themselves are sound, and worthy of being made known to our Parisian brethren, were not developed in a more complete manner than we find them in the two and a half pages, of which Dr. Macartney's memoir consists. We have heard the University of Dublin called "The silent Sister," and from the present specimen, we might suppose that she had only just begun to speak. What a pity that we cannot apply to her the text, "Out of the mouths of babes and sucklings" shall come forth-wisdom i

5. NEW EXPERIMENTAL RESEARCHES IN TRAUMATIC HEMORRHAGE.

This paper is by M. Amussat, whose researches have been principally directed to ascertain the nature of the changes which take place between the skin and the vessel, when an artery has been opened, and the bleeding has been arrested either spontaneously or otherwise.

When we remove the skin, we find the the ring. The folds of the peritoneum have uniform red colour, and enveloped in a kind of half of the toward, we find in homege-needs layer of carmiated blood; "the clear point, more or less large, of a lilacish-brown the to-morrow at Bicetre; woo he on these if multiple the depresed these conceptes. colour, and filled with a red clot, indicates the traject of the wound. This clot may be easily removed by a forceps, and then we find kind of canal, which always follows the direction of the wound, and leads to the injured point of the artery. These results differ from those obtained by Jones and Beclard, probably because they dissected the artery before wounding it.

M. Amussat concludes, from the experiments which he has made on a great number of animals :--

1st. That in closing the external opening into the skin, we close the canal of new formation by which the hemorrhage has taken place.

2nd. It results from the discovery of the central canal through the centre of the sanguineous tumour, that by following it we are conducted in a certain manner down upon the injured point of the artery.

3rd. That a mammelonated coagulum, of a deep or nearly black colour, indicates surely the orifice of the wounded artery.

6. BICETRE IN 1792. - ABOLITION OF IRONS IN THE TREATMENT OF THE INSANE.

This is a fragment from the unpublished works of Pinel by M. Scipion Pinel. is a very carious document, and is worthy of attention in more than one point of view. We reproduce it nearly literally :-

Towards the latter end of 1792, while the storm of revolutionary fury was raging in the centre of Paris, a scene of far different character took place at the gates of the city. For the first time the irons, under which the unfortunate inhabitants of Bicetre had hitherto groaned, were removed, and a system of humanity substituted for the regime of severity and torture that had so long prevailed in the hospital of insane. It was at this period that a man, relying on his knowledge and experience, and stimulated by the honourable desire of benefiting humanity, revolted against the idea of chaining up the wretched creaures entrusted to his care, like so many wild beasts in a dungeon. Indignant at this stupid outrage to human nature, he addressed himself to the authorities of the city. The answer was unfavourable. , Ping was treated as an aristocrat and a motlerate-terms at that time almost equivalent to a mandate of death. But Pinel was or easily arrested in his pursuit of good; with an cloudere commenwith an cloquence commen-

if, amidst the deranged, thou concealest a

single enemy of the people."

Conthon arrived on the following day at Bicetre. The appearance of the man was almost as strange as that of any of the deranged he came to visit. Deprived of the use of his lower limbs, and constantly carried about in the arms of a domestic, he looked like a fraction of humanity planted upon another frame, from the top of which, with a soft and feminine voice, he dealt out the implitiable sentence of death. Couthon came to see the patients himself, and visited them one after another. He was conducted to their quarter, but in the midst of cries and ferocious threats, interrupted only by the rattling of chains in some solitary dungeon, the republican was received with such a clamour of insults that he was soon compelled to retire in disgust. He turned towards Pinel and said, "Citizen, thou art mad also in desiring to unchain such un-governable animals." "Citizen," answered Pinel, "I have a profound conviction that the unfortunate wretches before us are merely untractable because they are deprived of air and liberty, and I have every reliance on means of a more humane nature.

Complete master of his own actions, Pinel now immediately commenced the exertion of his desire; but it was impossible to conreal the real difficulties of the task he had undertaken. To liberate more than fifty furious madmen without compromising the safety of his other more tranquil patients, was an experiment too hazardous; he determined, therefore, on beginning with twelve. The only precaution he thought it necessary to take was to preserve twelve strong waistcoats, in case they should be-

come altogether unmanageable.
The first to whom Pinel addressed himself was the patriarch of the house, the oldest inhabitant of this den of misery,-an English captain, whose history is unknown to all the rest, who had remained in the same cell, chained up, for forty-five years. He is regarded as the most dangerous of all the prisoners; his guardians approach him with the greatest circumspection, for once, with a single blow of his manacles, he laid a domestic dead on the spot. Since then he has been ironed with more precaution; but this increased rigour has only exasperated his temper, naturally furious. Pinel entered the cell, alone and calm. "Captain," said he to the unfortunate, "If I remove your chains, and restore you to liberty, will you promise me to be reasonable and not injure your neighbours?" "Certainly," was the reply; "but you jest; they are too much afraid, and so also are you." "No," said Pinel, "I am not afraid, for I have six men the education his pursuit, de-lines, "I am not afraid, for I have eix men behind me to execute my orders; but trust

my word; be confident and docile; I will his trony trans onged to list womenths, and give you liberty at once if you will merely he instantiate of feeling his out on this linen tacket instead of these deliverance. put on this linen jacket instead of these deliverance.
